Bouchard, Kathleen (INFC)

From: Bouchard, Kathleen (INFC)
Sent: March 4, 2019 8:02 AM
To: 'Seto, David'
Cc: Baird, Matthew (INFC)
Subject: Smart Cities challenge - webinar presentations
Attachments: Webinar - Performance Measurement - Final.pdf; SCC Webinar - Cyber Security.pdf

Good morning David, hope you had a nice weekend ☺
In the spirit of sharing some additional info with you and the review team, I thought I might forward the two attached presentations. One is on outcomes based performance measurement and the other on cybersecurity. These decks were shared with finalists via webinars with the goal of answering questions we were getting related to outcomes based performance measures and to privacy considerations.

The information was not meant to be applied verbatim (or used for the evaluation), just as general guidance. This might be useful to you and the team to understand some of the finalists' thinking in drafting those specific chapters.

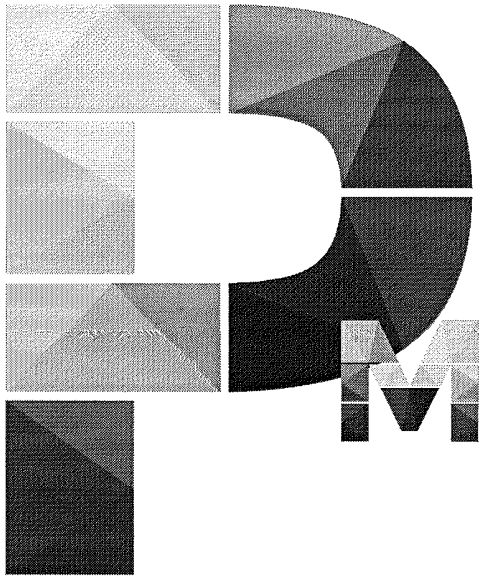
Kathleen

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

AGENDA

- Finalist requirements related to performance Measurement
- Presentation on Outcomes Based Performance by Susan Snider, Senior Associate at E.S. Tunis and Associates Inc.
- Contribution Agreement
- Communications touch base
- Wrap-up and next steps



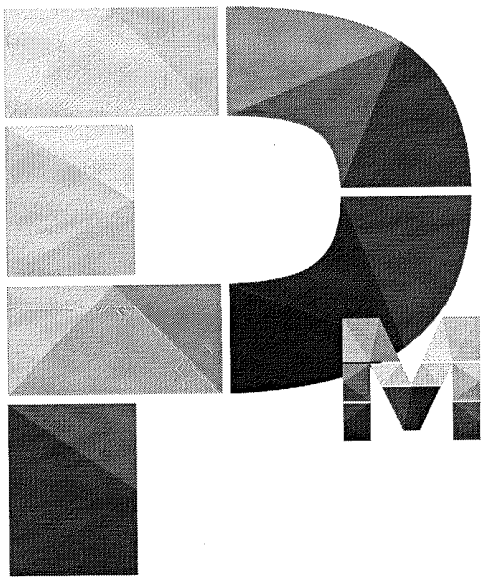
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 2 – Performance Measurement

Appendix 2

Links between project management and performance measurement

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



2018.11.29

OUTCOMES-BASED
Performance Measurement
SMART CITIES WEBINAR

SUSAN SNIDER
SENIOR ASSOCIATE
E.S. TUNIS AND ASSOCIATES INC.

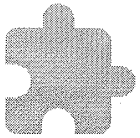
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

DESIGN PRINCIPLES

ASSUMPTIONS + RISKS

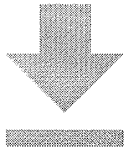
RESULTS + IMPACT

IMPLEMENTATION + SCHEDULING



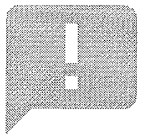
MEASURING PROGRESS TOWARD RESULTS

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

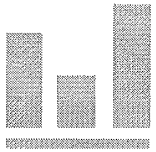


Design Principles

A technique to engage leaders in a strategic discussion about your approach to performance measurement and an opportunity to build a common mindset around the development of the performance measurement plan



FOR EXAMPLE

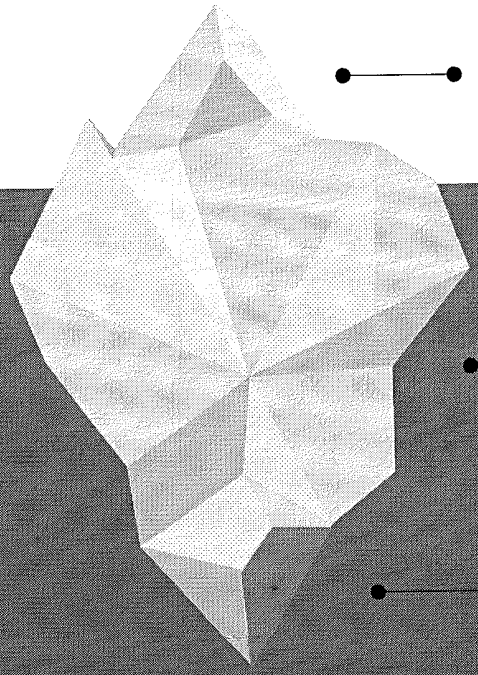


FIT FOR PURPOSE

MINIMUM VIABLE DATA

DATA STORYTELLING

VALUE ESTABLISHED SOURCES OF DATA



TIMING IS CRITICAL

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Results + Impact

Results are the achievements you expect to accomplish through the successful implementation of your project.

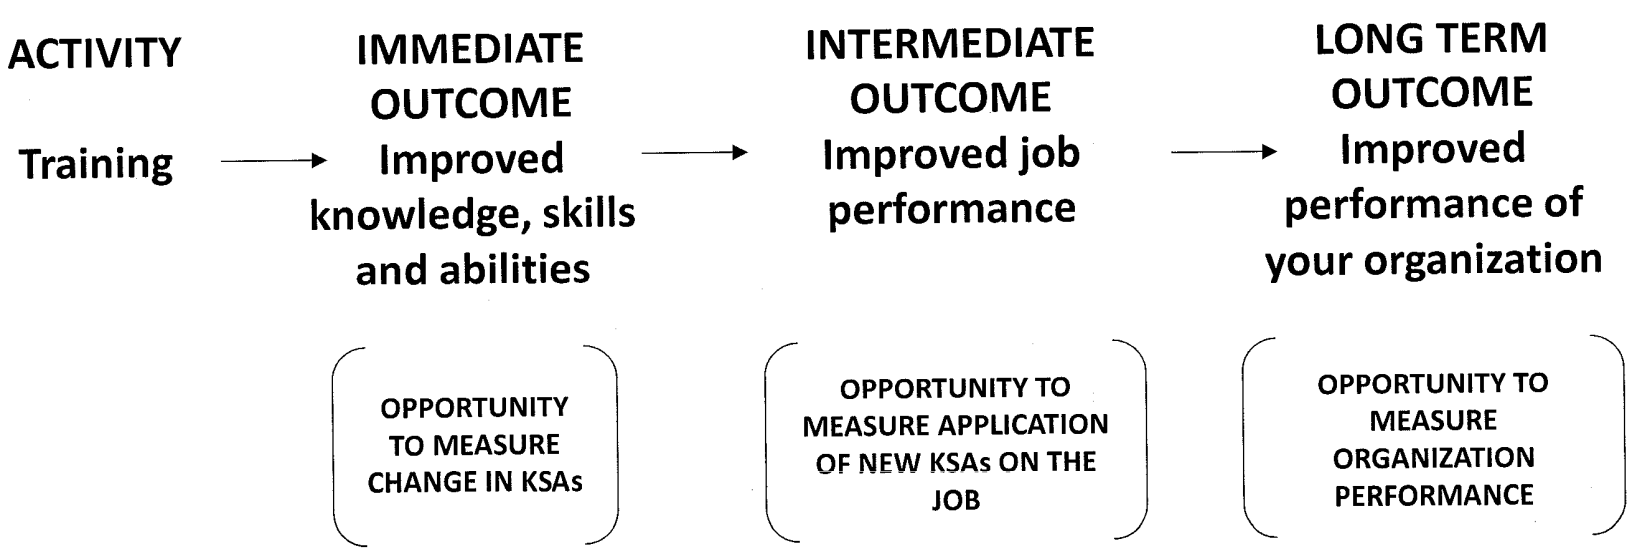
YOUR CHALLENGE STATEMENT

?

?

What additional results do you need to achieve to be successful?

A POINT OF CLARIFICATION:
RESULTS = OUTCOMES = GOALS = IMPACT



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

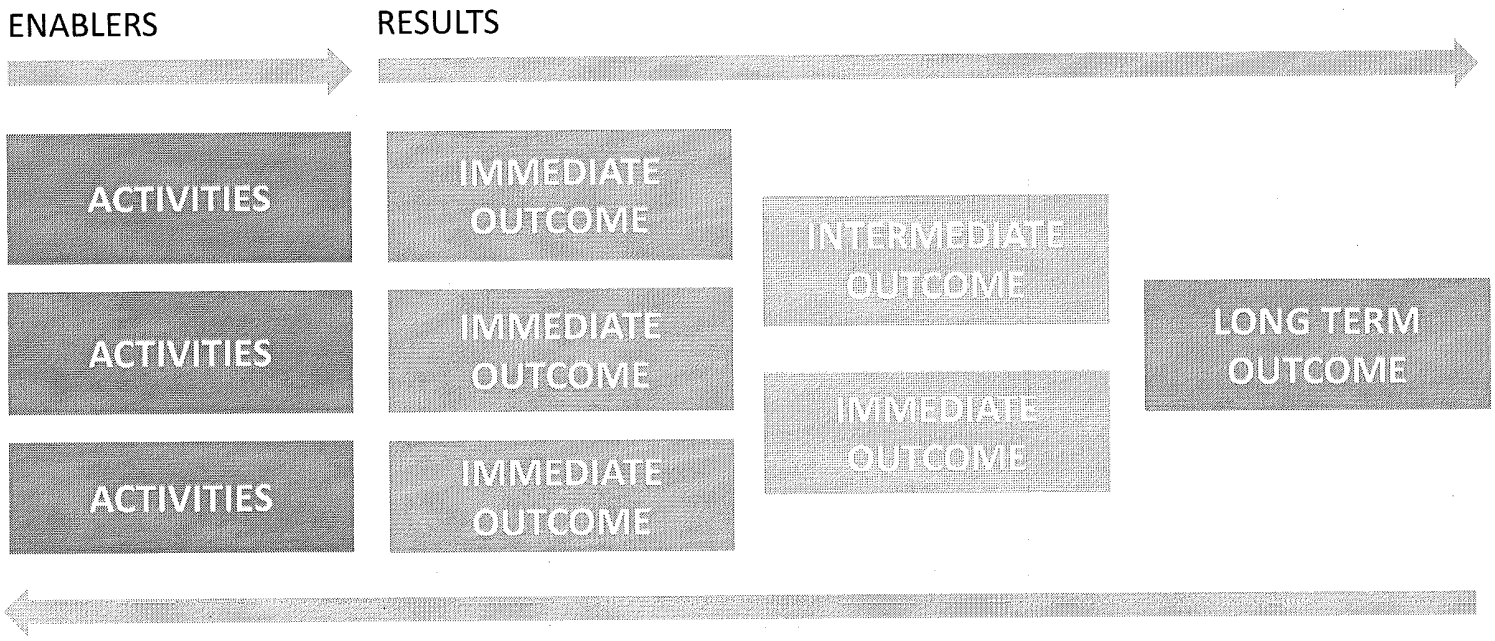
IMMEDIATE OUTCOMES Changes we expect to occur	INTERMEDIATE OUTCOMES Changes we want to occur	LONG-TERM OUTCOMES Changes we hope will occur
Produce	Directly Influence	Contribute To
Project Control	Canadians, Government and/or Organizations Control	No Control
Accountable For	Manage Towards	Correct Logic
Full Attribution	Medium Attribution	Low Attribution
To or For Canadians, Government and/or Organizations	Canadians, Government and/or Organizations Use	Canadians, Government and/or Organizations Benefit
Measured Cyclically or at Project Completion	Measured at Project Maturity	Measured Over the Long Term
Tangible, practical results which are directly related to your project activities	**Changes which are occurring in communities as a result of successfully achieving immediate results**	**Longer-term changes to society**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Results + Impact

FOR EXAMPLE … Think of the last time you participated in a conference, workshop or webinar

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

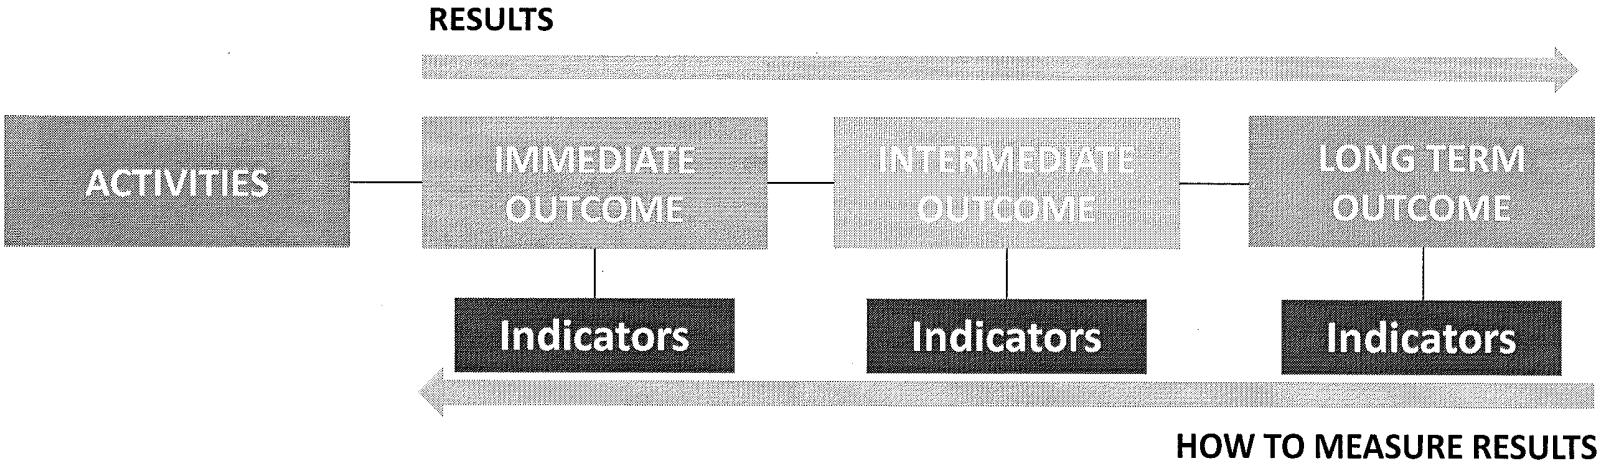


Creating Outcomes Statements

BEST PRACTICE ADVICE
Use words that show a change is underway

Improved … (knowledge, skills, ability …)
Increased … (awareness …)
Enhanced … (collaboration across a network …)
Greater … (supply of …)
Higher … (usage of …)
Diminished … (greenhouse gas emissions …)
Presence / Absence of …

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



Building A Logic Model

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Measuring Progress Toward Results

An indicator is a measurement tool to determine progress toward an outcome or whether an expected outcome has been achieved

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Creating Indicators

BEST PRACTICE ADVICE
Both quantitative and qualitative indications can be equally valuable in measuring outcomes, and most performance measurement plans include a combination of both

For example, quantitative indicators can be directly counted & expressed as a number:

- **% of** … participants who are employed
- **# of** … women in decision-making positions
- **Frequency of** …
- **Ratio of** …
- **Amount of** …
- **Timeliness of** …

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Creating Indicators (Cont'd)

QUALITATIVE INDICATORS involve the measurement of perceptions, but can often be analyzed quantitatively.

Examples include:

- Congruence with …
- Satisfaction with …
- Knowledge of …
- Ability to …
- Appropriateness of…
- Importance of …
- **Level of …**

Qualitative indicators require further measurement criteria so that they can be used properly.

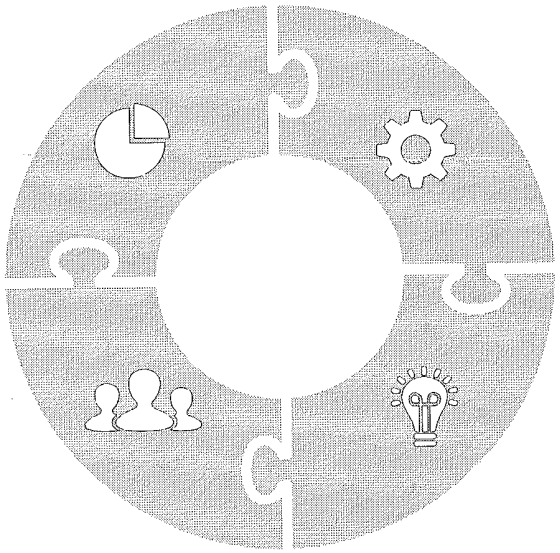
Example: **Level of citizen satisfaction**

Low | Citizens are not happy with any aspects of the product or service

Medium | Citizens are happy with some aspects but unhappy with others

High | Citizens are happy with all aspects of the product or service

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



The Data Universe

WHAT IS REPORTED

Surveys
Focus groups
Program data
User generated data

WHAT PEOPLE DO

Mobile phone use
App Use
Postal traffic
Financial transaction records

WHAT SENSORS MEASURE

Weather sensors
Traffic cameras
Satellite and drone imagery
GPS records
Ambient sensors

WHAT PEOPLE SAY

Social media
Online news
TV and Radio
Blogs
Micro-narratives

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Baselines + Targets

A BASELINE is the minimum or starting point used to establish current performance, against which you can compare future performance to assess if change is really happening

A TARGET is the future state to which you aspire. Setting targets is a strategic planning exercise which captures how much change could or should occur.

A BENCHMARK AND A TARGET, WORKING TOGETHER, SHED LIGHT ON HOW MUCH CHANGE HAS ACTUALLY OCCURRED

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Definition		Example: Poverty
OUTCOME | A statement of intended change	**What result you want to achieve**	Reduce poverty in Canada
INDICATOR | Measurement device to measure intended change	**What you are going to measure**	Number of Canadians living in low income
BASELINE | State of performance at start of project	**Where you are today**	4.2 million Canadians as of 2015 (representing 12.1% of Canadians)
TARGET | Quantified level of performance to be attained by a certain date	**Where you want to be in the future**	3.36 million Canadians by 2020 and 2.1 million by 2030 (A 20% reduction from 2015 levels by 2020 and a 50% reduction from 2015 levels by 2030)
SUMMARY		Number of Canadians living in poverty reduced to 3.36 million by 2020 and reduced to 2.1 million by 2030 from 4.2 million in 2015

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Definition (Cont'd)

SUMMARY

METHODOLOGY | The rules, procedures and definitions guiding the collection of data

How you are going to treat the data

SOURCE OF DATA | How the data will be collected

Where the data is coming from

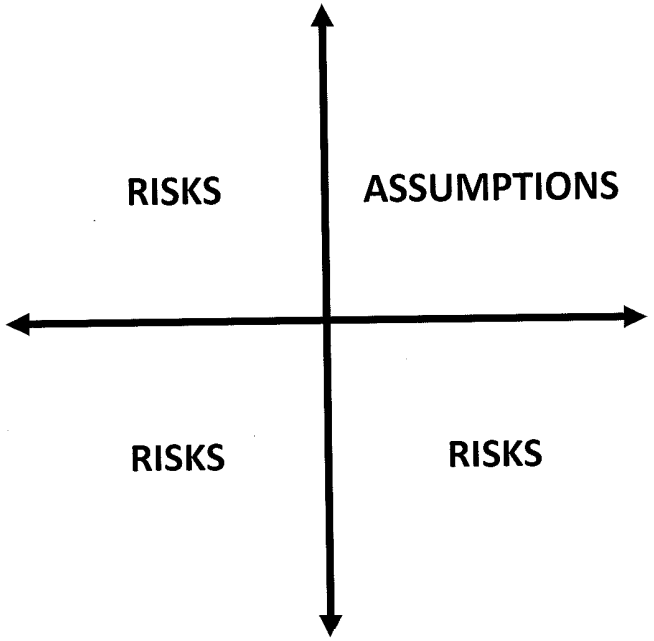
TIMING + FREQUENCY | When and how often the data will be collected and assessed

When the data will be available to support decision makers

Example: Poverty

Number of Canadians living in poverty reduced to 3.36 million by 2020 and reduced to 2.1 million by 2030 from 4.2 million in 2015

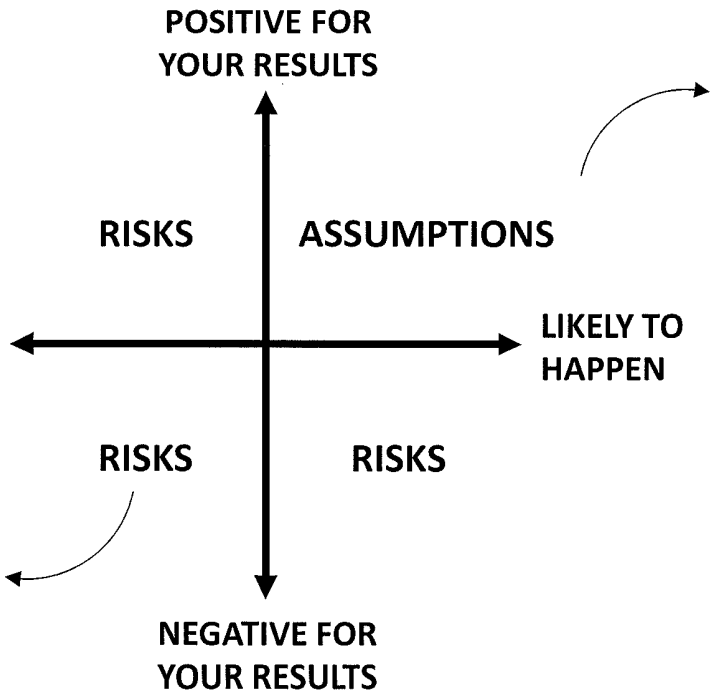
Market-basket measure (MBM): The measure of low income is based on the cost of a specific basket of goods and services representing a modest, basic standard of living. When the disposable income for the MBM of an individual falls below the applicable threshold, the person is considered to be in low income.



Statistics Canada, Census of Population, Market

Every five years (2021 & 2026), with data released within 18 months of data collection

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



Assumptions + Risks

Throughout the process of building your performance measurement plan, you will undoubtedly come across areas in which you need to make certain ASSUMPTIONS. Similarly, your team will naturally start discussing the RISKS associated with various approaches you may take.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Assumptions + Risks

Assumptions are typically external conditions essential to the achievement of expected results – it is "assumed" certain conditions or factors will be in place for the project to be a success

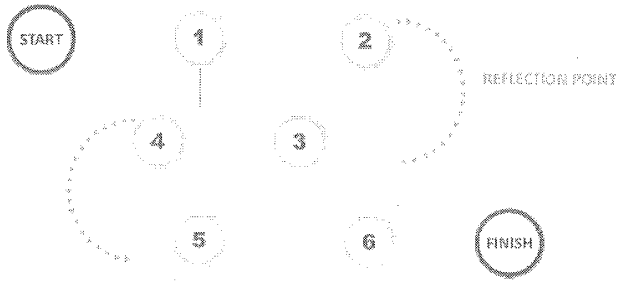
Risks can be viewed as external factors that can negatively affect the achievement of expected results – these are factors which can jeopardize the success of a project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Assumptions + Risks

BEST PRACTICE ADVICE
Consider asking the following questions ...

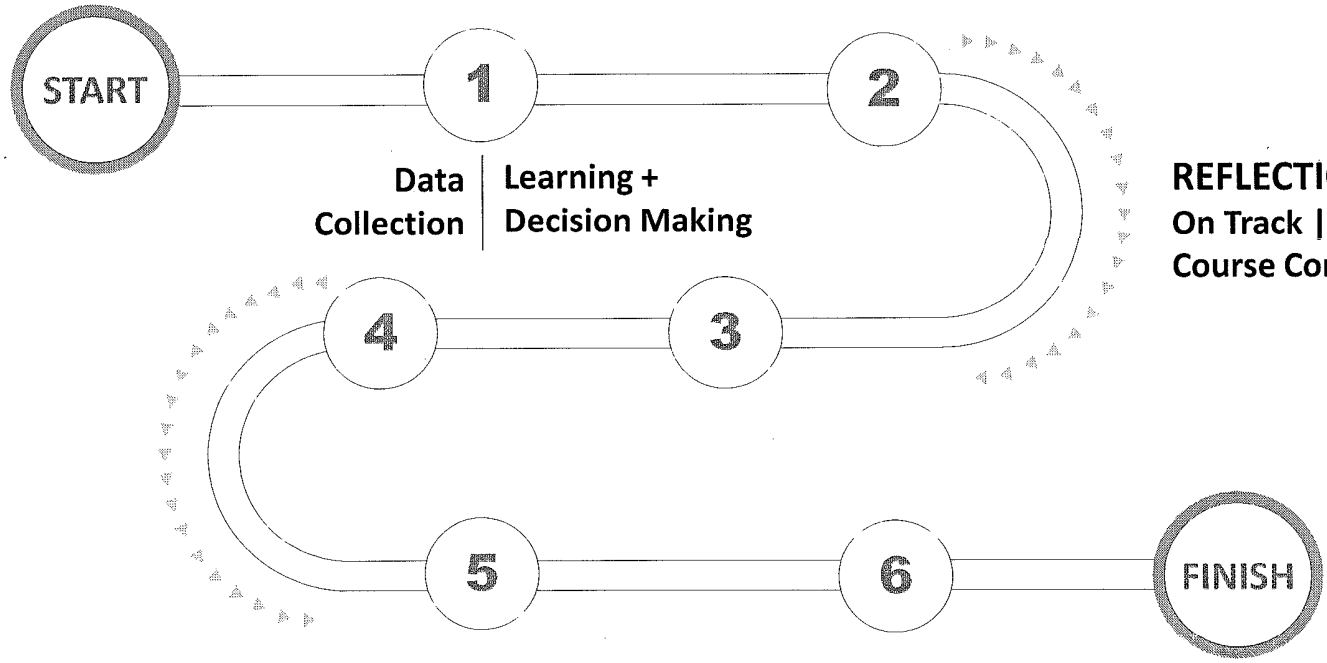
1. What are we **assuming** will happen or be in place in order to achieve our results?



2. Is there any **risk** that certain key conditions could change or not be in place? | How serious is this risk? (high-medium-low?) | How probable is the risk? (high-medium-low?) | How can we mitigate these risks?

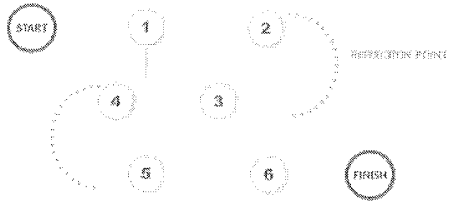
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Monitoring + Evaluation



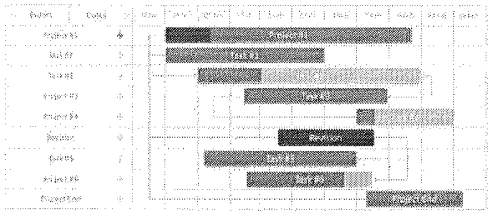
BEST PRACTICE ADVICE

Once you have developed data collection methods, and associated timing and frequency elements, you can now combine these into a monitoring and evaluation section to map out how all of these activities will be sequenced over the life of the project



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Monitoring + Evaluation



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Monitoring + Evaluation

+

QUESTIONS FOR YOUR CONSIDERATION:

Are you able to map high level project timelines, deliverables and milestones against the sequence and timing of data collection activities?

At what point in the project do you anticipate being able to assess the expected achievement of immediate, intermediate and long term outcomes?

Do you have opportunities built into the project to make course corrections or move through iterations if progress toward results is not as successful as you originally anticipated?

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Payment Schedule

A FINAL THOUGHT …

Think strategically about how you want to develop a payment schedule which links payments to outcomes

You have the freedom to be creative and innovative in how you develop your performance measurement plan and this in turn will set the foundation for a future contribution agreement

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Questions ?

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CONTRIBUTION AGREEMENT

- What is an outcomes-based contribution agreement?
- How will the final proposal components fit into a an outcomes-based contribution agreement?
- Considerations

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Communications touch-base

Instructions

Dear Smart Cities Challenge Jury member,
You have been tasked with evaluating the 20 Finalist proposals of the Smart Cities Challenge Competition 1, with a priority assignement to 5 proposals.

This Excel tool is meant to assist you in documenting your assessments.

If you have any questions or issues regarding the tool, please contact Kathleen Bouchard at kathleen.bouchard@canada.ca or at (613) 790-1838.

Using the Evaluation Grid

The colored tabs in this workbook contain an Evaluation Sheet for each Finalists. You can access them by scrolling left or right at the bottom of the workbook, or by selecting the name of the Finalist in the Table of Contents.

The chapters, criteria and weight of each are provided in each sheet.
When evaluating a criteria, select the cell under the "Jury Score" column and a drop-down button should appear to the right. Select the score that you believe is appropriate.
A legend of the "Jury Score" is available at the top of each sheet for your reference.

Thank you for your participation!

Plan is detailed, complete, feasible, and well-suited to achievement of outcomes	10 pts.	
Plan supports the implementation of projects	10 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0
Chapter 4: Technology (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, feasible, and well-suited to achievement of outcomes	10 pts.	
Plan supports the implementation of projects	10 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0
Chapter 5: Governance (20 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, feasible, and well-suited to achievement of outcomes	10 pts.	
Plan, including partnerships, supports the implementation of projects	5 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0
Chapter 6: Engagement (30 pts. Total)	**Weight**	**Jury Score**
Engagement to date and plans to engage residents and other stakeholders in the implementation phase are detailed, complete, inclusive, meaningful, and well-suited to achieve the outcomes	10 pts.	
Plan supports the implementation of projects	5 pts.	
Diversity and inclusion are reflected in project design, and facilitate the implementation of projects	10 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0
Chapter 7: Data and privacy (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, high quality, and well-suited to achievement of outcomes	10 pts.	
Plan supports the implementation of projects	5 pts.	
Open and big data strategies are employed to the extent possible and facilitate transferability and replicability of technologies and projects	5 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0
Chapter 8: Financial (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, high quality, and well-suited to achievement of outcomes	10 pts.	
Plan supports the implementation of projects	5 pts.	
Report on the use of the finalist grant is detailed, complete, and demonstrates a rational and effective use for the development of the final proposal and sound management of project funding	5 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0
Chapter 9: Implementation phase requirements (10 pts. Total)	**Weight**	**Jury Score**
Plans for meeting relevant municipal, provincial, and federal reporting and legislative requirements are provided and serve as sufficient groundwork for the implementation phase should the finalist be selected as a winner	5 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.

$10 Million CITY OF RICHMOND

Legend (based on criteria weight of 5 or 10 points)
(0/5 or 0/10) No demonstration
(1/5 or 2/10) Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
(2/5 or 4/10) Some good aspects, some questionable/weak demonstrations that need to be addressed
(3/5 or 6/10) Reasonably good demonstration on most aspects with some weaknesses that need addressing
(4/5 or 8/10) Very good demonstration on virtually all aspects some weaknesses of modest consequence
(5/5 or 10/10) Exemplary demonstration with no weaknesses

Chapter 1: Vision (15 pts. Total)	**Weight**	**Jury Score**
Final proposal is driven by the Challenge Statement and carries through the vision laid out in the application	5 pts.	
Final proposal is transformative, scalable, and replicable within the community and to other communities in Canada	10 pts.	
		0

Chapter 2: Performance measurement (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, feasible, and well-suited to achieve the outcomes	10 pts.	
Plan forms a solid basis for development of outcomes-based contribution agreement	10 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0

Chapter 3: Project management (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, feasible, and well-suited to achievement of outcomes	10 pts.	
Plan supports the implementation of projects	10 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0

Chapter 4: Technology (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, feasible, and well-suited to achievement of outcomes	10 pts.	
Plan supports the implementation of projects	10 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0

Chapter 5: Governance (20 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, feasible, and well-suited to achievement of outcomes	10 pts.	
Plan, including partnerships, supports the implementation of projects	5 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0

Chapter 6: Engagement (30 pts. Total)	**Weight**	**Jury Score**
Engagement to date and plans to engage residents and other stakeholders in the implementation phase are detailed, complete, inclusive, meaningful, and well-suited to achieve the outcomes	10 pts.	
Plan supports the implementation of projects	5 pts.	
Diversity and inclusion are reflected in project design, and facilitate the implementation of projects	10 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0

Chapter 7: Data and privacy (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, high quality, and well-suited to achievement of outcomes:	10 pts.	
Plan supports the implementation of projects:	5 pts.	
Open and big data strategies are employed to the extent possible and facilitate transferability and replicability of technologies and projects:	5 pts.	
Risk strategy is thorough and adequately addresses key risks:	5 pts.	
		0

Chapter 8: Financial (25 pts. Total)	**Weight**	**Jury Score**
Plan is detailed, complete, high quality, and well-suited to achievement of outcomes	10 pts.	
Plan supports the implementation of projects	5 pts.	
Report on the use of the finalist grant is detailed, complete, and demonstrates a rational and effective use for the development of the final proposal and sound management of project funding	5 pts.	
Risk strategy is thorough and adequately addresses key risks	5 pts.	
		0

Chapter 9: Implementation phase requirements (10 pts. Total)	**Weight**	**Jury Score**
Plans for meeting relevant municipal, provincial, and federal reporting and legislative requirements are provided and serve as sufficient groundwork for the implementation phase should the finalist be selected as a winner	5 pts.

COMPLETE CHECK FOR FINAL PROPOSAL

FINALIST:				
ASSESSED BY:				
VALIDATED BY:				
APPROVAL BY: *select one: Jenny Tremblay / Eric Poirier*				
DATE OF COMPLETION: *enter date when all completed boxes are checked*				
REQUIREMENTS	**COMPLETED**	**IF NOT COMPLETED, NOTE REASON**	**GUIDING PRINCIPLES**	**ACTIONS**
		SUBMISSION		
Submitted to infc.sc-vi.infc@canada.ca by 23:59 PST on March 5, 2019	☐		• No extensions will be granted • No exceptions will be made for lateness or technical problems (finalist must be able to show evidence of submission)	• # to contact finalist • If not resolved, # to flag to DG for decision
Final proposal is submitted	☐		• No extensions will be granted • There is flexibility on the finalist video until the end of the week	• Assessor to save everything in designated folders • # to contact finalist if anything is missing • If not resolved, # to flag to DG for decision
Finalist video is submitted	☐		• There is flexibility on the finalist video until the end of the week	• Assessor to save everything in designated folders • # to contact finalist if anything is missing • If not resolved, # to flag to DG for decision
Preliminary Privacy Impact Assessment or Preliminary Rationale Analysis	☐		• No extensions will be granted	• Assessor to save everything in designated folders • # to contact finalist if anything is missing • If not resolved, # to flag to DG for decision
		FINAL PROPOSAL		
Written in one of Canada's official languages	☐		• If the final proposal is submitted in a language other than English or French, a companion version in English or French is required from the finalist	• # to extract the executive summary from the final proposal and send it to translation (if a French final proposal, send the entire document to translation)
Generally readable (e.g. picture is not covering text, text are not overlapping)	☐		• If there are serious formatting issues that hinders readability, the finalist may need to resubmit	• # to do a scan of the final proposal and verify that all text and tables, graph, etc. could be read
Text-based and in either MS Word (.doc or .docx) or a fully readable, searchable, and selectable PDF (.pdf) format	☐		• Finalist may adjust the format for INFC posting purposes after the deadline	• # to verify with Comms if format is suitable for posting, given INFC web accessibility standards • If not suitable, # to contact finalist
No longer than 75 pages* (Financial chapter exempted) and in 12 point font	☐		• Finalist cannot adjust content after the deadline • If the text overall is smaller than 12 point font, INFC will adjust and evaluate within the new page count	• # to notify finalist if final proposal is over 75 pages • # to notify finalist if INFC had to adjust the font and page count

Contains an executive summary	☐			• # to QC and save translated version into the designated folder
Organized by these distinct chapters (not limited to these; not necessarily in the same order): • Vision • Performance measurement • Project management • Technology • Governance • Engagement • Data and privacy • Financial • Implementation phase requirements	☐	*List any other chapters if necessary*	• Finalist must have these chapters • Finalist can have more chapters • Finalist can change the order of the chapters	• If the chapters are not clearly labeled, # to do a light analysis of where the content may be and make a note for the Jury
FINALIST VIDEO				
No longer than five minutes	☐		• Finalist may cut down the time for INFC posting purposes after the deadline	• # to notify finalist if video is longer than five minutes and needs cutting down
Submitted as a file or in a downloadable format	☐		• Finalist may adjust the format for INFC posting purposes after the deadline	• # to verify with Comms if format is suitable for posting, given INFC web accessibility standards • If not suitable, # to contact finalist
CONFIDENTIAL ANNEX (OPTIONAL)				
Submitted if and only if required	☐			• # to flag with DG if confidential annex is lengthy

Stand-Up Meeting

Date March 5th

Subject: Final Proposal: Intake Completeness Check

Bonjour Team,

Thank you for providing me with the results of your completeness check analysis and for conducting the additional verifications requested.

There are a few follow-ups to be done as noted on some of the completeness checklists but those have no bearing on the content to be sent to our external expert reviewers at Raymond Chabot Grant Thornton or for the package to the Jury. Please prepare those packages for distribution and I will ok the sending on review in person with you.

Otherwise, please prepare the appropriate emails for sending to each of the finalists for my review and approval.

Merci encore pour tout le bon travail.

ATIA - 19(1)

Note to File – Decision on Completeness Check Approach and Follow-up

In undertaking the completeness check of final proposals submitted on March 5, 2019, it was determined that all proposals were "complete" and ready for assessment. The following issues were identified during this check with recommended actions:

- There were six proposals that exceeded the 75-page limit. However, the amount was determined to be within a reasonable variance (e.g. 1-2 pages) and was the result of omitting the cover and/or table of contents from the 75-page count.
- There were a few proposals that had a significant number and/or length of appendices. As guidance was provided to finalists that there would be no guarantee that any content (excluding the PPIA, letters of support, confidential annex, financial information) beyond the 75-page limit would be assessed by the Jury, but no limit on the number of appendices a finalist could include, it has been decided to include all submitted appendices as part of the proposal packages to the assessors and Jury

ATIA - 21(1)(b)

March 7, 2019

Process and Calendar of Key Dates

March 07 Jury receives all 20 Finalist Proposals (due to file sizes and proper handling of confidential information, Central Collab will be the file repository for download)

- ✓ Jury members begin their review of the 20 final proposals, prioritizing files assigned to their working groups.
- ✓ City of Montreal and City of Quebec originals will be in French

March 18 Montreal and Quebec City English translations will be provided to the jury (exact date, TBD)

Mar. 7 - Mar 22

- ✓ Jury members review, preliminarily score and comment on their 5 priority proposals.
- ✓ Jury members have a sound understanding and are familiar with their 5 assigned priority proposals.
- ✓ Working groups connect to discuss/compare results/calibrate criteria rating. INFC will host a teleconference group discussion with each of the 4 groups.
- ✓ A working group representative will be designated to present the final proposal to the full Jury during the first deliberation.
- ✓ Jury members should continue review & preliminarily score all proposals [redacted]

April 9 INFC receives expert reviews

April 10 INFC provides a support package to Jury members, including expert reviews for download via Central Collab

- ✓ Jury members review the support package and continue their assessments.

April 10- 16 Jury members send questions or requests for clarification (if any) on the expert reviews

- ✓ INFC will collect questions from Jury members to forward to experts and seek responses prior to April 23
- ✓ As needed, experts can be available during the first deliberation

April 22 Travel to Ottawa for Session 1- Discussion and Deliberation

April 23-24 Session 1- Discussion and Deliberation

- ✓ Presentations of each final proposal
- ✓ Discuss proposal
- ✓ Calibration discussion on criteria rating, based on assessments to date
- ✓ Draft and send follow up questions to finalist for written response (500 words) and/or further questions to experts by May 1
- ✓ Draft output (tbd, e.g. preliminary consensus grid or select scores for each finalists)

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

For consideration and further discussion: What is the output you would like to see out of the first deliberation? What tools would you want (e.g. voting tech, analysis of preliminary scores submitted in advance, live group scoring)?

BY May 1 INFC to consolidate finalist and expert responses to jury questions

May 2-3 Session 2- Consensus and Recommendation

- ✓ Consider finalist and experts answers
- ✓ Build the jury consensus scoring grid for each finalist
- ✓ Recommend 4 winners

For consideration and further discussion: what tools / activities would best support you in achieving this output?

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Subject: re' Annexes

Hi David, thank you for the early heads up on your assessement of the file and scope of work. After consulting with the team, I would advise as follows: RCGT should base their assessment on the content of the Chapters and the main body of the approx. 75 page proposals plus the financial information. The finalists are aware that they would be assessed on the 75 page proposals plus the financial information. (not the annexes).

Annexes:
The annexes should be treated as supplementary sources of information. If appropriate and useful, your SMEs may avail themselves of the information contained therein but should not feel the need to review the full annex. For example, the PPIA are not to be "assessed" but considered globally as part of the approach to Data and Privacy. The requirement was for finalists to produce one.

Please let me know if this is clear and if you have any other questions or concerns.
The earlier we address these things, the better.

Thanks again,

Kathleen

Subject: Final Smart Cities Challenge proposals available for download

Dear Smart Cities Jury Members,

As the Secretary to the Jury, it is my pleasure and privilege to let you know that the Smart Cites Challenge Finalist Proposals and tools for your evaluation are now accessible on Central Collab. As we mentioned on the call last week, the sharing platform now allows you to download all materials at once rather than individually. Instructions on accessing Central Collab and a description of the content available follow at the end of this message.

A few reminders:

- **Confidential info:** Please be mindful of the sensitive nature of some of the content. We tagged confidential components with "CONF" to denote their careful treatment due to privacy analyses, confidential commercial or other sensitive information entrusted to us by finalists and/or partners.
- **Discretion:** A respectful reminder of the need to be discrete and secretive about your notes, views, comments, etc., other than with your Jury colleagues and the INFC Secretariat supporting you.
- **Fairness:** While documents from finalists proposals are starting to be posted by finalists, please only evaluate the versions provided by INFC in case finalists make modifications or add information for the benefit of their residents.
- **Support:** The team will be reaching out to you in the next week to start finding time for working group discussions that may work for you.
- **Travel:** please do not hesitate to contact Vicki McKenzie on our team to help you book deliberation travel. The sooner booked, the better travel choices will be available to you.
- **Information to come:** Translations of two final proposals are expected by March 18. We will also circulate by email the links to the finalist videos once they are all on the finalists' websites.

I look forward to continuing to support you in your important task,

Jenny Tremblay

****

HOW TO ACCESS

Step 1: Accessing the proposals:

- Sign in to Central Collab
- If you don't remember your login info click on FORGOT YOUR PASSWORD OR USERNAME
- If you have any issues, contact Kathleen Bouchard through email or at (613)790-1838.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Step 2: Downloading the files

[redacted]

ATIA - 16(2)

Step 3: Unzipping the Final Proposals

- Once saved onto your computer, you may have to unzip the folder to access the files.
  - MacOS: The file should automatically be unzipped into the same folder when you open it.
  - Microsoft Windows 10: Select the zipped folder and the "Compressed Folder Tools" should appear above. Select "Extract all" to unzip the files.

  - Microsoft Windows 7/8: Right-click the zipped folder and select "Extract All..." to unzip the files.
  -
  - If you are not running on the above operating systems, you may need to download an appropriate software, such as WinZIP.

Content:

20 Finalist sub-folders, each containing files specific to a finalist. You will notice that not all finalists have items under #2 and #4, these were not a requirement.

1. Finalist Proposal
2. Letters of support
3. Privacy Impact Assessments
4. Confidential Annex

- Jury Evaluation Grid.xslx for early scoring and comments (instruction and assignments in tabs)
- Process and Calendar
- Priority Assignment List
- Finalist Guide (English and French)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Subject: Smart Cities finalist videos

Hi colleagues!

As you may know, the 20 Smart Cities Challenge finalist proposals came in to INFC on March 5. Finalists have each produced videos describing/summarizing their projects, and most finalists have posted these online [redacted] If you are interested, you may want to take a look through some of these – they give a good flavour of what finalists plan to implement, if they become one of the four big prize winners.

BRIEFING NOTE TO THE MINISTER

SMART CITIES CHALLENGE FINAL PROPOSALS AND NEXT STEPS

(For Information)

PURPOSE

To provide a status update and next steps on the Smart Cities Challenge following receipt of the twenty final proposals.

HIGHLIGHTS/KEY CONSIDERATIONS

- **All final proposals were received.** The twenty Smart Cities Challenge final proposals and finalist videos were submitted on Tuesday, March 5, 2019. Finalists also submitted a Preliminary Privacy Impact Assessment and some also submitted an optional confidential annex, both containing sensitive information. For your information, please find attached a USB key (**Annex A**) containing:
    - Twenty finalist files with the final proposals and associated annexes. Confidential components are identified as "CONF" in the file title to denote the need for their careful treatment due to privacy analyses, confidential commercial or other sensitive information entrusted to us by finalists and their partners.
    - A document listing links to finalist videos on their respective websites (**Annex B**).
- **Final proposals will be posted online but the means have changed.** The department is currently in the process of translating the executive summaries for each of the twenty proposals for posting on the Infrastructure Canada website, along with links to the full final proposals (except for confidential information) available on the finalists' websites. While the department had originally intended to post the entire proposals on the INFC website, logistical issues (e.g. translation time and cost due to page volume) limit timely online posting. As of the date of this note, almost all finalist proposals have been posted online.
- **The expert review and evaluation process has started.** The period of March 6, 2019 to early May 2019 will be dedicated to the expert review and the Jury evaluation of the final proposals.
    - The final proposals and associated annexes have been provided to the Smart Cities Challenge Jury as well as to the expert review contractor (Raymond Chabot Grant Thornton, selected following a solutions-based Request for Proposal procurement process).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- The Jury can immediately start familiarising themselves with the proposals and evaluate the final proposals against the criteria.
- Expert reviews will also be prepared by departmental officials (and other federal departments and agencies, as required) on certain components of the final proposals.
- A Jury Support Package will be provided containing all expert reviews as input to the Jury's ongoing evaluation.
- The Jury will meet in person in Ottawa on two occasions for deliberations--on April 23-24 and on May 2-3.

- **Your decision will be sought in May.** On May 3, the department will prepare a decision note to present the Jury's recommended slate of four winners for your consideration and approval. A quick decision will be required for the planned announcement of winners on May 14, 2019 at the National Arts Centre.

NEXT STEPS

- As soon as possible after May 3, 2019, you will receive the Jury's recommendation of winners for each of the Smart Cities Challenge prizes: one $50 million, two $10 million and one $5 million.

Kelly Gillis
Deputy Minister
Infrastructure and Communities

Subject: Fwd: re' Annexes

Hi David, from our perspective, the tool can remain as is. The jury will consult the Expert advice on a section by section basis as needed (not so much in a linear chapter order). They too will be using an excel scoring sheet that uses the suggested chapter order from the finalist guide but will adapt to the order of the proposals.

While the tool associates chapter numbers to topics, you could simply remove the word "Chapter" and evaluate the topics in a consistent order regardless of the actual order of the proposal.

Hope this works, we'd be happy to meet tomorrow or anytime this week to look at how this impacts the work and better understand your issue so we can find a simple solution.

Hi Kathleen,

Thanks for the feedback.

What I intended to note about the model, was that, for example, Chapter 2 in the tool is Performance Measurement, while Chapter 2 for [redacted] is Community Engagement and Chapter 5 is Performance Measurement. Would you like us to rename the links and worksheets related to Chapter 2 in tool (i.e. The first evaluation chapter in our tool) to be Chapter 5, so that Performance Measurement remains in the same place in all models and Summary Sheets) or move Performance Measurement to the place in the model where Chapter 5 (I.e. Governance) current exists? I think both could create some confusion when it comes to reviewing the summary pages, but the former would be easiest for comparison sake.

Kindest Regards,

David

Are you comfortable with us leaving the evaluation tool and report structure in the order prescribed by the Finalist Guide (with perhaps a cross reference to the actual section numbers and names from the proposals) or are you proposing that we create a custom tool and report structure for each proposal, that doesn't already align with the Finalist Guide, based on how they elected to present their sections? The later would require additional time and effort and I also believe it would lead to confusion when comparing evaluation results against each other.

Hi David, please see our responses in red included in the body of the email below.
Hope this covers any questions, let me know if you need anything else.

Kathleen Bouchard

Senior Analyst, Smart Cities Challenge
Infrastructure Canada / Government of Canada
kathleen.bouchard@canada.ca / Tel: 613-790-1838

The Project Team and the SMEs met this morning to go over the summaries of the proposals and would like to confirm a couple things with you:

1. We will not be referring to, or considering, the Annexes in our evaluation (w/the exception of Chapter 8: Financials (if included as an Annex) and the PIA/PRA). We do not feel that looking at some and not all of the annexes would lend itself to a fair and/or equitable evaluation and potentially opening the door to challenges from communities that abided by the instructions provided in the Finalist Guide: ***"As concise as possible; no longer than 75***

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

pages in 12 point font (no page limit on the Financial chapter outlined in Section 5.9)". Based on our conversation yesterday, it is my understanding that INFC has already informed the applicants that the Annexes would not be considered in the evaluation process.

- We support this approach. We would ask that you provide an overarching statement that points to this in your review documents. *"(...) in the spirit of fairness and based on the criteria in the Finalist Guide... RCGT will not be referring to, or considering, the Annexes in our evaluation (w/the exception of Chapter 8: Financials (if included as an Annex) and the PIA/PRA) (...)"*

2. Based upon the following criteria presented in the Finalist Guide:

   "As concise as possible; no longer than 75 pages in 12 point font (no page limit on the Financial chapter outlined in Section 5.9)".

   How would you like us to treat the proposals that exceeded 75 pages in the body of the proposals? For example:

   - [redacted] Body of Proposal excluding Chapter 8 (Financials) totals 76 pages.

- Following a completeness check, we have deemed that all the proposals were eligible and within an acceptable page range (overage includes covers, graphics and table of contents...) Our intention is not to ignore or disqualify

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

proposals for minor derogations from the page limit.

3. Based upon the following criteria from the Finalist Guide:

> ***"Following an executive summary, there are nine chapters that are required for your final proposal:***
> ***1.Vision***
> ***2.Performance measurement***
> ***3.Project management***
> ***4.Technology***
> ***5.Governance***
> ***6.Engagement***
> ***7.Data and privacy***
> ***8.Financial***
> ***9.Implementation phase requirements"***

How would you like us to consider the respondents whose Chapters/Sections do no align with the Chapters specified in the Finalist Guide? The Chapters should be evaluated based on their topics (order is not so important). Finalists were allowed to organize the flow of information in the way that works best for them. In our completeness check we validated that the program chapters were there albeit in a different order than that suggested. In one instance the title of the Chapter was slightly reworded, let us know if you require support identifying the chapters.

For Example:

- [redacted]

Proposal has Chapters 8

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

and 9 reversed (i.e. Chapter 8 is the Implementation Plan and Chapter 9 is the Financials section. Would you like us to evaluate them Chapter 9 as their response to the requirements for Chapter 8?

- [redacted] Proposal does not correctly align their responses to the appropriate Chapters (Chapter 2 is Community Engagement, should be Performance Measurement, Chapter 3 is Technology, should be Project Management, Chapter 4 is Project Management, should be Technology, Chapter 5 is Performance Measurement, should be Governance, Chapter 6 is Governance, should be Engagement, Chapter 9 is Risk Management (should not be a Chapter on its own), should be Implementation Phase Requirements. Finalists exercised discretion to add a well identified Risk Chapter which you should cross-reference and use

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

to evaluate risks for the associated topics: Engagement – Technology – Program Management – Performance measurement – Governance – Data and Privacy – Finance – Implementation

- [redacted] Proposal does not name their sections by chapter and they are not in the order specified in the Finalist Guide. (The table of Content shows the order and content)
- [redacted] Proposal does not correctly align Chapters to those specified in the Finalist Guide
  The Financial annex at the end should be considered as the Financial Chapter
- [redacted] Proposal does not correctly align Chapters to those specified in the Finalist Guide
- [redacted] Proposal does not correctly align Chapters to those specified in the Finalist Guide
  The Risk Strategy from pages 60 – 67 should be used to evaluate risks for the associated topics

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Kindest Regards,

Subject: re' Annexes

Hi David, thank you for the early heads up on your assessement of the file and scope of work. After consulting with the team, I would advise as follows: RCGT should base their assessment on the content of the Chapters and the main body of the approx. 75 page proposals plus the financial information. The finalists are aware that they would be assessed on the 75 page proposals plus the financial information. (not the annexes).

Annexes:
The annexes should be treated as supplementary sources of information. If appropriate and useful, your SMEs may avail themselves of the information contained therein but should not feel the need to review the full annex. For example, the PPIA are not to be "assessed" but considered globally as part of the approach to Data

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

and Privacy. The requirement was for finalists to produce one.

Please let me know if this is clear and if you have any other questions or concerns.
The earlier we address these things, the better.

Thanks again,

Kathleen

ATTACHED GUIDANCE DOCUMENT AND GRID

Hi gang,
As mentioned this morning at the huddle, Kathleen and I will lead a short information/Q&A session Tuesday afternoon to go over the review guidelines for the three chapters (Vision, Engagement and Implementation Phase Requirements). We will send out the guidance document in advance of the meeting.
Thanks!
Amanda

Evaluation Grid for 1-6-9.xlsx...

SCCD Internal Review Approac...

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

MARCH 11, 2019

INTERNAL REVIEW OF VISION, ENGAGEMENT AND IMPLEMENTATION PHASE REQUIREMENTS CHAPTERS OF FINAL PROPOSALS – APPROACH AND GUIDELINES

Objective

To ensure that the best possible support to the Jury and, ultimately, to the Minister for their deliberations, recommendations and choice of winners, Smart Cities Challenge Directorate (SCCD) is coordinating reviews of the twenty final proposals. Separately, in-depth technical reviews will be undertaken by a contracted external firm (Raymond Chabot Grant Thornton (RCGT)) for six chapters of the final proposals, and three chapters will be reviewed by the Smart Cities Challenge team in consultation with other government departments (OGDs), if required. These reviews will result in the creation of support packages for the Jury.

This document details the approach to the internal reviews undertaken by SCCD. It includes the scope of work, timelines, dedicated resources, and information about assessment guidelines, rubrics and tools.

Scope of Work

SCCD will produce and provide preliminary assessments for the following chapters of the final proposals:

- Vision
- Engagement
- Implementation Phase Requirements

These assessments will be packaged with the external expert assessments delivered by RCGT and shared with the Jury.

Dedicated Resources

To undertake this review in a consistent, timely and proficient manner, SCCD's Program team will commit seven staff members over a period of six weeks (March 5 - April 18) to complete the reviews and provide support packages to the Jury.

Implicated staff are expected to conduct a reorganization of priorities in order to ensure that this work is completed in addition to core regular duties. In the event that supplementary hours are necessary, they should be flagged and approved by management in advance.

The following Review Teams will be established:

Prize Category	Staff
$5 million	Matt Baird and Josie Sirna
$10 million	Susan Hwang and Alex Long
$50 million	Kathleen Bouchard and Amanda Aizlewood (includes French language proposals)

Reviewers will work both independently and in their Review Teams to ensure consistency of approach and product. Reviewers will work together to draft single consolidated assessments for each proposal.

A Review Committee will be established to ensure consistency across reviewers. Membership will consist of all Review Team members and by other members of SCCD as deemed appropriate by management.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Work Plan and Timeline

Work will be undertaken from March 8-April 9 inclusively. This timeframe takes into account the need for coordinated support from additional subject area experts within SCCD, INFC, OGDs, and other resources as needed.

Work will proceed according to the following schedule:

Date	Tasks and Deliverables
March 8	Final Proposals assigned and distributed to SCCD reviewers/Review Teams Guidelines and assessment tools (template, criterial interpretation and evaluation grid) distributed to SCCD reviewers/Review Teams
March 8-22	Reviewers independently complete reviews of Vision, Engagement and Implementation Phase Requirements chapters, consulting additional internal and external subject matter experts as necessary Review Team members meet to produce consolidated reviews within prize categories Review Teams across prize categories consult regularly to compare consistency of tone and approach
March 23-29	Upon receipt of preliminary technical review reports from RCGT, Review Teams align their reports with respect to tone and presentation (where necessary/possible)
March 31 - April 5	Reviews are verified for consistency and accuracy by Review Committee
April 8-9	Final technical review reports received from RCGT Final reviews are revised as necessary Jury packages are produced and finalized for each Final Proposal and submitted to Review Committee for final approval Review Committee approves final Jury packages
April 10	Senior management approves final Jury package Review packages sent to Jury

Review Guidelines

The evaluation criteria used by SCCD reviewers are the same as those used by the Jury and by the external technical reviewers. This will ensure consistency and ease during the consolidating phase of the work plan.

The evaluation criteria and helpful rubrics can be found in Annex A to this document. Reviewers will use these criteria, as laid out in the Smart Cities Challenge Finalist Guide, and will provide preliminary quantitative summations and short qualitative rationale for each criterion. Reviewers will record their quantitative and qualitative assessments in the assessment template, found here (W:\Smart Cities\1. Secretariat\4. Dev. and Design\Competition 1 - Evaluation of Finalists\2. SCCD Evaluating Chapt. 1-6-9)\Evaluation Grid for 1-6-9). Qualitative rationale should identify and reference key elements, including strengths and weaknesses. These narratives should be no longer than a half page per chapter.

General Guidance

Evaluation considerations specific to each chapter are outlined below. In addition to these specific considerations, reviewers should take note of the following general guidance:

- *Purpose*. The purpose of the internal and external assessment/review process is not to fully evaluate or rank the merit of the Final Proposals. The purpose is to provide the Jury and ultimately

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the Minister with comprehensive and considered summaries of the key strengths and weaknesses of the submissions so that they may take this information into account during their deliberations.

- *Comprehensive Approach*. While reviews are produced on a chapter-by-chapter basis, reviews should be approached with a comprehensive vision of the entire proposal; reviewers are expected to read the majority (or entirety) of the final proposals to determine if the content of each chapter reflects and upholds the proposal's key points and intentions.

- *Risk-based Approach*. Since they are not subject matter experts, reviewers are expected to employ a rational and risk-based approach to these reviews. If there are doubts raised by the content, for instance if links between core elements seem tenuous, there are clear gaps in the proposal or if there are legal or regulatory elements which seem pertinent but are not considered or addressed, a risk-based approach can flag these and lead to further investigation. Reviewers are encouraged to note problem areas, to discuss them other reviewers and flag them to management as necessary.

Vision

The Vision chapter brings the proposal together. This chapter should coherently present the overall objectives of the proposal as well as the "journey" of each finalist from initial application to final proposal. This should include a comprehensive presentation of the vision and Challenge Statement, and a demonstration of how these continue to respond to community needs. It is expected that some evolution will have taken place between the initial application and the submission of the final proposal. You are expected to consider this evolution and assess whether any deviations are explainable and reasonable.

The vision and Challenge Statement should clearly map to outcomes. As such, a review of this chapter requires a thorough assessment of the flow and linkages between the desired result and outcomes in the Challenge Statement and the relevance of the approach to each merit criterion (vision, transformative, scalability, replicability). This will require a thorough reading of the entire proposal.

Reviewers may consult the opinions rendered by the external supplier or by the OGD experts that were engaged on the initial application as part of their review. For further information on OGD experts, see Kathleen.

Engagement

This chapter requires that finalists demonstrate their plan to continue the engagement of residents and stakeholders during the implementation phase of their project should they be selected as a winner. As such, this chapter should provide a clear and coherent plan for engagement during the implementation phase. It should detail the engagement strategy, lessons learned from the application and proposal development phases, and the types of tools used to encourage engagement. Finalists are also expected to consider diversity and inclusion in the development of their engagement plan and to reflect the risks and issues.

Detailed guidance related to diversity and inclusion can be found here: https://impact.canada.ca/en/challenges/smart-cities/finalist-guide#appendix1. Reviewers may also consult the webinar deck on this subject, saved here: W:\SMART CITIES\1. Secretariat\21. Finalists\Support Measures\2. Finalist Webinars\4. Engagement et Mobilisation (Nov.6).

As part of the consolidation process within Review Teams, reviewers may also consult the opinions rendered by the external technical reviewers once these are available, and as necessary.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Implementation Phase Requirements

This chapter requires a close look at relevant municipal, provincial, and federal reporting and legislative requirements that would be triggered should the proposal go forward as a winner. SCCD reviewers and other subject matter experts at INFC will determine which of the aforementioned requirements would be triggered and if the plans to address them are reasonable and suitable.

The following four requirements are identified in the Finalist Guide:

1. *Duty to Consult with Indigenous groups and Modern Treaty Obligations*

    - The common law *duty to consult* is based on judicial interpretation of the obligations of the Crown (federal, provincial and territorial governments) in relation to potential or established Aboriginal or Treaty rights of the Indigenous peoples of Canada, recognized and affirmed in section 35 of the Constitution Act, 1982. In Canada, the duty to consult with and accommodate with Indigenous peoples arises when the Crown contemplates actions or decisions that may affect an Indigenous person's Aboriginal or Treaty rights.
    - The Duty to Consult is a constitutional duty that invokes the Honour of the Crown and it must be met. The duty is triggered at a low threshold: all that is required is contemplated Crown conduct resulting in a potential adverse impact to a credible claim.
    - In addition to fulfilling legal obligations to engage with modern treaty holders and self-governing Indigenous groups, finalists may also consult on the basis of the Duty to Consult or as a good governance practice.

    - *Modern Treaties* (also called Land Claim Agreements) are a key component of Canadian nation-building. They advance the shared objective of reconciliation, promote strong and sustainable Indigenous communities, and advance national socio-economic objectives, to the benefit of all Canadians.
    - Treaties are legally binding and constitutionally protected agreements that set out specific rights, benefits and obligations for the signatories.
    - Treaty provisions will vary from treaty to treaty. Treaties and treaty rights also vary depending on the time and circumstances in which they were negotiated.

2. *Community Employment Benefit (CEB)*

    - The Investing in Canada plan (under which the Challenge is funded) encourages project planners and communities across the country to take advantage of their infrastructure projects to support the diversification of recruitment, training, and procurement practices.
    - Detailed CEB guidance can be found here.
    - For the Smart Cities Challenge, finalists are asked to plan and explain how their projects would bring Community Employment Benefits should they become a winner.

3. *Climate Lens Assessment (CLA)*

    - The CLA has been designed as a framework for assessment and reporting for any projects that either:
        (1) deal directly with greenhouse gas mitigation or climate change adaptation, and
        (2) are funded by the program in the amount of $10 million or above.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- The Investing in Canada plan encourages planners to consider the climate impacts of any project funded under the program. The Climate Lens Assessment (CLA) is intended to provide meaningful insight into the climate impacts of individual projects, and encourage improved choices by project planners consistent with shared federal, provincial, and territorial objectives articulated in the Pan-Canadian Framework for Clean Growth and Climate Change.
- Detailed CLA guidance can be found here.
- Just one finalist (Richmond) meets the requirement to undertake a climate lens assessment.
- If other finalists consider the CLA in their approach, these should be evaluated.
- If the Finalist clearly explains that they undertook the due diligence and concluded that it is not required to develop a Climate lens assessment, they would not be penalized.

4. Other applicable laws, regulations and policies, including any cases of changes or exemption to legislation and regulations that may apply to projects.
   - Finalists should demonstrate the extent to which they explored these possible requirements.
   - In general, the assessment of plans for meeting these requirements should not try to identify all applicable legal considerations. Rather, reviewers are asked to assess whether the proposal demonstrates that sufficient groundwork has been done to prepare for the implementation phase should the finalist be selected as a winner (e.g. has an environmental scan been completed of the project that identifies potential compliance issues and other legal considerations as well as a strategy for addressing them?).
   - This process require some light research on the part of the reviewers to explore whether the planned projects within proposals may be subject to other requirements must be addressed. A document to record other possible requirements has been created and is saved here (Other requirements - Implementation Phase.docx). Reviewers are asked to make note of other applicable requirements for the benefit of other reviewers and the Review Committee.
   - Assessment of this chapter will unfold in two steps:

     Step 1. In consultation with INFC subject matter experts (see below), reviewers should undertake a review of each of the four potential requirements outlined in this chapter and provide a short rationale on whether the proposed approach is relevant and appropriate to meet implementation requirements (~a very short paragraph for each potential requirement).
     - Should a reviewer determine that the proposal refers to or requires regulatory considerations outside of INFC's purview, SCCD may reach out to OGDs to seek clarity or opinions on how well they are addressed. Reviewers should consult with each other and with Eric Poirier in order to consolidate and optimize outreach to OGD experts.
     - If the requirement does not apply, reviewers should describe the requirement as "not applicable" as part of the qualitative rationale section of the evaluation grid.

     Step 2. Once each of the four implementation requirements have been assessed by the subject matter experts, reviewers will finalize their preliminary quantitative summations and finalize a summary short qualitative rationale for the chapter.

Subject Matter Experts. Reviewers are encouraged to seek out further guidance and advice as needed. The following resources are available:

- Duty to Consult and Modern Treaty Obligations:
  i. Eric Poirier
  ii. Matt Baird (SCCD)
  iii. Aboriginal Consultation and Environmental Services (INFC – Program Integration Branch)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Climate Lens Assessment (CLA) and Community Economic Benefits (CEB): Policy and Results Branch – Sectoral Policy) Legal Services: If a legal opinion is required, reviewers must first consult with Eric Poirier.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ANNEX A – ASSESSMENT CRITERIA

Chapter 1: Vision (15 points TOTAL)

Requirements

Finalists were asked to present their smart cities journey, including:

- *How the final proposal carries through the vision laid out in your Challenge Statement and the outcomes in the application, and provides reasonable justification of any variations*
- *How outcomes continue to be:*
  - *reflective of the true needs of the community, as demonstrated through a compelling body of data and evidence and extensive resident engagement*
  - *ambitious and achievable*
  - *meaningful for the community and its residents*
  - *well-suited to a smart cities approach*
  - *measurable*
- *Progress towards outcomes that may have been achieved during the finalist phase*
- *Reasons to be selected as a winner*

Evaluation criteria

Final proposal is driven by the Challenge Statement and carries through the vision laid out in the application: 5 points

5	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖

2	Some good aspects, some questionable/weak demonstrations that need to be addressed ❖ [redacted] ❖
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations ❖ [redacted] ❖
0	No demonstration ❖ [redacted] ❖

Final proposal is transformative, scalable, and replicable within the community and to other communities in Canada: 10 points

10	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖

4	Some good aspects, some questionable/weak demonstrations that need to be addressed ❖ [redacted] ❖
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations ❖ ❖ [redacted]
0	No demonstration ❖ [redacted] ❖

Chapter 6: Engagement - 30 points TOTAL

Requirements

Finalists were instructed to present an engagement plan for the implementation phase, including:

- *Approach to engaging with, gaining acceptance from, and onboarding residents and other stakeholders for projects that ensures ongoing alignment between the outcomes and their concerns and needs*
- *Insights gained through previous engagement processes with residents that shaped the final proposal in a significant way*
- *Tools used in past, planned, and ongoing engagement activities that are adapted to target different population groups and encourage ongoing, high participation*
- *Efforts made to be inclusive and consider the diversity of residents, including the ways in which certain population groups could be positively/negatively and intentionally/unintentionally affected by projects*
- *Experienced or expected reactions from residents and other stakeholders and approaches for managing potential issues*
- *Identification of risks and development of appropriate mitigation strategies*
- *Other details, as required*

Evaluation criteria

Engagement to date and plans to engage residents and other stakeholders in the implementation phase are detailed, complete, inclusive, meaningful, and well-suited to achieve the outcomes: 10 points

10	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖
4	Some good aspects, some questionable/weak demonstrations that need to be addressed ❖ [redacted] ❖
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations ❖ [redacted] ❖
0	No demonstration ❖ [redacted] ❖

Plan supports the implementation of projects: 5 points

5	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖
2	Some good aspects, some questionable/weak demonstrations that need to be addressed ❖ [redacted] ❖
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations ❖ [redacted] ❖
0	No demonstration ❖ [redacted] ❖

Diversity and inclusion are reflected in project design, and facilitate the implementation of projects: 10 points

10	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖
4	Some good aspects, some questionable/weak demonstrations that need to be addressed ❖ [redacted] ❖
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations ❖ [redacted] ❖
0	No demonstration ❖ [redacted] ❖

Risk strategy is thorough and adequately addresses key risks: 5 points

5	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖
2	Some good aspects, some questionable/weak demonstrations that need to be addressed ❖ [redacted] ❖
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations ❖ [redacted] ❖
0	No demonstration ❖ [redacted] ❖

Chapter 9: Implementation Phase Requirements - 10 points TOTAL

Requirements

This chapter requires finalists to identify and provide the plans for meeting applicable municipal, provincial, and federal reporting and legislative and policy requirements should you be selected as a

Evaluation criteria

Plans for meeting relevant municipal, provincial, and federal reporting and legislative requirements are provided and serve as sufficient groundwork for the implementation phase should the finalist be selected as a winner[1]: 5 points

5	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖
2	Some good aspects, some questionable/weak demonstrations that need to be addressed ❖ [redacted]

[1] Note that SCCD staff are not legal experts. As possible, and by employing a risk-based approach to the review process, SCCD will endeavour to identify applicable laws, regulations, etc. pertinent to the final proposals. However, given the breadth of subject matter contained in the proposals, it may not be possible to fully determine the applicability of all relevant elements.

	❖ [redacted]
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations ❖ [redacted] ❖
0	No demonstration ❖ [redacted] ❖

Risk strategy is thorough and adequately addresses key risks: 5 points

5	Exemplary demonstration with no weaknesses ❖ [redacted] ❖
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence ❖ [redacted] ❖
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing ❖ [redacted] ❖

Infrastructure Canada Weekly Status Report			
Project Name	Smart Cities Challenge - Finalist Proposals Evaluation		
Date	03/18/2019	**Reporting Period**	03/04/2019 to 03/15/2019

Distribution List:			
Project Authority	**Kathleen Bouchard** **Jenny Tremblay** **Matthew Baird**	**RCGT Project Lead**	**David Seto**

1. Overall Project Status

Scope	Completed adjustments to the Methodology and Project Plan, and Project Charter inclusive of the composition of project teams. Assessment Report #1 (D4A) for [redacted] is in progress. SME review of remaining 19 proposals ongoing.
Budget	See Appendix A of status report for budget details.
Schedule	Project on schedule.

2. Major Milestones/Deliverables Performance

Milestone / Deliverable	Planned Completion Date	Date Approved by Project Authority	Status (See Legend Below)
Introductory Meeting (D1A)	02/07/2019	02/07/2019	Completed
Preparatory Work (D1B)	03/06/2019	03/06/2019	Completed
Methodology and Project Plan (D2A)	03/01/2019	03/08/2019	Completed
As required: adjustments to the Methodology and Project Plan (D2B)	03/12/2019	03/12/2019	Completed
Assessment Report #1 (D4A)	03/22/2019		In progress
Assessment Reports #2 to #20 (D4B –D4T)	04/08/2019		In progress

- GREEN – On target to achieve Planned Delivery Date.
- AMBER – Planned Target Delivery Date is in danger of not being achieved but a managed solution capable of bringing forward the actual delivery date is being applied.
- RED – Planned Target Delivery Date is not going to be achieved or has already passed. No work rounds or solutions capable

2. Major Milestones/Deliverables Performance			
Milestone / Deliverable	**Planned Completion Date**	**Date Approved by Project Authority**	**Status (See Legend Below)**
of bringing forward the planned dates are available.			

3. Activities & Risks/Issue Monitoring	
Activity Description	**Date of Completion**
Key Activities Completed over the Reporting Period	
Review of Preparatory Work	03/06/2019
Delivery and Acceptance of Project Charter	03/08/2019
Delivery and acceptance of Project Plan	03/08/2019
Key Activities Planned for Next Reporting Period	
Draft Assessment Report #1 [redacted]	03/19/2019
Final Draft Assessment Report #1 [redacted]	03/22/2019
Assessment Report #2 - #20	Ongoing

Risks/Issue Management

No.	Risk/Issue Description	Mitigation Strategy	Date Approved by Project Authority
1	Resource availability	RCGT will engage an equally qualified resource from the pool of experts from our national network of resources	02/06/2019
2	Conflicts of Interest	RCGT has already completed Conflict Checks for each of the proposed team members. If additional resources are required, Conflict Checks will be completed prior to any participation in the project. Nationwide Conflict Check underway to identify any potential conflicts of interest between the 20 Finalists and any of our other offices.	02/06/2019

Appendix A

Budget reporting – work completed versus budget spent to date, as at 3/15/2019.

Total Fees (Budget)	Fees Incurred to Date	Travel
$280,500	[redacted]	$0

Hi Matt,

Some points of info from standing meeting thought you might find interesting:

- The Federal Budget it coming out tomorrow. [redacted]
- Chair of the Jury had good things to say in his call with Jenny this morning. He confirmed that they feel independent and are very happy with our team's support. [redacted]
- [redacted]
- [redacted] seeing as it is difficult to collect data on outcomes without help.
- Jury deliberations will be held at Novatel and Chateau Laurier.
- We received back the executive summaries that had to be translated.
- Start thinking about how finalists from round 1 can be 'ambassadors' for future rounds.
- Noting that perspectives from within the team will differ on the evaluations given several helped write the applicant guide and completed site visits and others did not. This suggests that the perspective of those who have not been part of those processes may have a similar perspective as the Jury.

Best,
Shantel

Subject: RE: INFC | Smart Cities Challenge Finalist Proposal Evaluation - [redacted]

Hi David,

Thank you for providing us with an example case of your preliminary assessment for our review of your general assessment approach and report design. We are providing the following feedback:

General – We really like the work performed and the approach. For the most part the assessment report's structure, length, depth and tone is appropriate and well-balanced. We particularly like the assessment summary table at the end which we feel will be a useful reference for the Jury to use during their evaluation process.

We do recommend a change to the layout of the document sections such that the sections containing the boiler plate wording (i.e. Section 1 limitations and Section 2 objective, scope and methodology etc.) be combined together into its own section. This section should appear either at the very front or the very end instead of in between the executive summary and proposal overview.

[redacted]

Please spell out all acronyms (e.g. ABC costing – Activity Based Costing) as not all jury members will be familiar with these technical terms. Also noted was an inconsistency in the use/non-use of contractions.

Proposal Overview - [redacted]

Performance Measurement - [redacted]

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

[redacted]

Data and Privacy - [redacted]

We expect that there will be a review of all of the assessments and recalibration in order to ensure that the assessment criteria were applied in a consistent fashion. [redacted]

Let me know if you wish to discuss. We would also like to hear from you whether you had any feedback from your team of assessors/SMEs with respect to the clarity of the assessment criteria.

SMART CITIES CHALLENGE

Finalist Webinar #2:

Implementation Phase Requirements

August 28, 2018

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

AGENDA

- Overview
- Community Employment Benefits (CEB)
- Climate Lens Assessment (CLA)
- Duty to Consult and Modern Treaty obligations
- Other applicable laws, regulations and policies
- Communications touch base
- Next steps

Community Employment Benefits (CEB)

COMMUNITY EMPLOYMENT BENEFIT (CEB)

- Encourage communities to diversify recruitment, training and procurement practices
- Gather data on best practices across Canada, highlighting opportunities and challenges faced by construction industry and related sectors
- Results will be reported annually over the course of the project

http://www.infrastructure.gc.ca/pub/other-autre/ceb-ace-eng.html

TARGETED GROUPS

- Groups targeted by the CEB initiative include:
    - Indigenous peoples
    - Women
    - Youth
    - People with disabilities
    - Veterans
    - Recent Immigrants
    - Apprentices
    - Small and Medium Enterprises
    - Social Enterprises

NEXT STEPS FOR FINALISTS

- If selected as a winner, what are your plans for:
  - Identifying target groups that would benefit from your projects as well as goals for each group
  - Reporting on the CEB, including submission timelines
  - Collecting, managing, and tracking the required data
- Remember to reflect these plans in relevant chapters of your final proposal (e.g. project management, engagement, data and privacy, financial)

Q&A

Submit questions using the chat function

Climate Lens Assessment (CLA)

ABOUT THE CLIMATE LENS

- Assess expected greenhouse gas (GHG) emissions and/or resilience to the impacts of climate change
- Applies to winners whose projects have a total value of more than $10 million and have either a climate change adaptation or mitigation focus

http://www.infrastructure.gc.ca/pub/other-autre/cl-occ-eng.html

GREENHOUSE GAS MITIGATION ASSESSMENT

- Measure a project's anticipated GHG emissions impact
- Scope includes direct and significant indirect effects (emissions and reductions)
- Timeline includes construction, operations, and maintenance over the asset's expected life
- [Project Emissions] – [Baseline Emissions] = [Overall Emissions]

CLIMATE CHANGE RESILIENCE ASSESSMENT

- Analysis of future climate conditions and risk treatment
- Plans to projects resilient to future climate conditions and impacts
- Attestation by qualified party

NEXT STEPS FOR FINALISTS

- *If the CLA pertains to you*, and if selected as a winner, what are your plans for:
  - Conducting the CLA, submission timelines, and who would complete/attest to it
  - How much it would cost
  - Collecting, managing, and tracking the required data
- Remember to reflect these plans in relevant chapters of your final proposal (e.g. project management, engagement, data and privacy, financial)
- *If the CLA does not pertain to you*, state that the total cost of projects with a primary focus on climate change adaptation, resilience, disaster mitigation, or a reduction in GHG emissions is less than $10 million

Q&A

Submit questions using the "chat" function

Other applicable laws, regulations and policies

Duty to Consult and Modern Treaty obligations

FINALIST CONSIDERATIONS

- The Finalist Guide lists the Duty to Consult and Modern Treaties as implementation requirements to consider
- These are listed in order to raise awareness and ensure that Finalists take the time to consider whether these may be triggered in the context of their proposal
- Regardless, in the spirit of Reconciliation, we encourage you to engage with any Indigenous peoples in your community
- Indigenous peoples will bring new perspectives, expertise, and interests to your project that you may not have considered

Q&A

Submit questions using the "chat" function

Communications touch-base

NEXT STEPS

- Next webinar: Sept 11, 12:30 p.m. EST
- Reminder: sign and return grant agreements
- Site visit: discuss with Primary Contact potential dates and activities
- Finalist Fall forum: early November (exact date TBD)

IMPLEMENTATION PHASE REQUIREMENTS

Our Smart Cities projects have been planned to address our various requirements and commitments to our residents and other stakeholders. This includes our commitments to meet applicable municipal, provincial, and federal reporting and legislative and policy requirements.

9.1 INDIGENOUS ENGAGEMENT

We recognize the importance of good faith engagement and understand the legal duty to consult for the Provincial and Federal Governments may be triggered by any Crown conduct that may adversely impact any potential or established Aboriginal or Treaty rights. We have established relationships with neighbouring First Nations. These include the Musqueam Indian Band, Tsawwassen First Nation, and Squamish First Nation.

Our engagement procedures support the federal and provincial guidelines, including the federal Aboriginal Consultation and Accommodation – updated Guidelines for Federal Officials to Fulfill the Duty to Consult (March 2011) and the provincial guidelines, Updated Procedures for Meeting Legal Obligations when Consulting with First Nations (May 2012).

The City of Richmond has a long-term relationship with the Musqueam Indian Band. Musqueam representatives have participated on the Advisory Committee for the Smart Cities Challenge. We intend to collaborate to develop technology solutions that can help the Musqueam people as they see fit. By their participation as a member of our Advisory Committee, we want to ensure that the needs and interests of their community are addressed as we move to the implementation phase of the Smart Cities projects.

We have reached out to all three First Nations to begin dialogue on our Smart Cities Challenge program.

9.2 COMMUNITY EMPLOYMENT BENEFIT (CEB)

Richmond is a vibrant, rapidly developing city with a strong economy that has attracted thousands of its residents from around the world. Our population has the highest proportion of immigrants of any city in Canada. 74% of our population originates from Asia-Pacific countries with at least 54% speaking a language other than English or French at home. The City recognizes the importance of reflecting this cultural diversity in our workforce in order to effectively serve the diverse needs of the community, through the award winning Human Resources program for people with disabilities.

To support our commitment to workplace diversity, the City of Richmond offers a variety of intercultural awareness training initiatives to increase the level of employee awareness and understanding within the workforce. We employ two full-time diversity coordinators and we are working to incorporate diversity and cultural awareness as part of our Respectful Workplace Policy. Richmond also provides a new immigrant welcome package, in multiple languages, to help new residents tap into the wide range of support services offered.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9.2 COMMUNITY EMPLOYMENT BENEFIT (CEB)

Promotion of diversity is demonstrated through:

- Applying different problem solving skills towards a common goal
- Building relationships with different community groups
- Embracing diverse perspectives and approaches that foster innovation
- Guiding decision making and planning through inclusion, cooperation, dynamism, integration, and equality
- Providing equal opportunity in all areas of our work
- Implementing systems and procedures that consider individual differences in all aspects of our service and planning delivery

We are committed to participate in Infrastructure Canada's Community Employment Benefits Initiative. We already have a strong commitment to workplace diversity and are dedicated to continue our diversity strategy with our Smart Cities Projects. We will continue to provide employment and/or procurement opportunities to the groups targeted by the CEB initiative including apprentices; Indigenous peoples; women; persons with disabilities; veterans; youth; recent immigrants; and small-sized, medium-sized and social enterprises. We will establish specific targets for our projects, allowing for flexibility to consider various factors such as complementing our existing employment initiatives and our local labour market dynamics.

9.3 REPORTING

We will provide Infrastructure Canada with our benefit targets for the federal target groups listed above. This will be completed as soon as possible after the Challenge award outcome. We will report annually on our progress against the targets for each project which will include the number of hours worked by a target population and/or the value of contracts provided to target groups. We will identify key successes as well as any challenges in attempting to meet the project targets. We have assigned a dedicated resource who will collect, manage and track the required data to report against our targets.

9.4 CLIMATE LENS ASSESSMENT

The City of Richmond has a strong commitment to addressing and mitigating climate change. The City has achieved carbon neutral status annually since 2013 and anticipates maintaining that status for the foreseeable future. From 2007 to 2015, the City reduced Greenhouse Gas emissions by 12%, despite a population growth of 12% in the same period.

We are committed to undertaking a comprehensive Climate Lens Assessment to provide meaningful insight into the climate impacts of individual projects and to ensure consistency with shared federal, provincial and territorial objectives articulated in the Pan-Canadian Framework for Clean Growth and Climate Change.

As our project has both climate change mitigation and climate change adaptation, resilience and disaster mitigation elements, we will conduct both requirements under the Climate Lens Assessment: the GHG Mitigation Assessment and the Climate Change Resilience Assessment.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9.4.1 GREENHOUSE GAS MITIGATION ASSESSMENT

We will procure a qualified assessor (i.e., a professional engineer or GHG Accounting Professional) to conduct the assessment who will provide an attestation confirming that the assessment conforms to the guidance provided by Infrastructure Canada and aligns with the relevant assessment standard. Our Mitigation Assessments will consider the same greenhouse gases tracked through Canada's National Inventory Report and will include all direct and all significant indirect emissions. We will assess each project across the construction and operations and maintenance phases, and will include estimates of a project's cumulative construction and operations and maintenance emissions over the useful lifespan of the infrastructure.

Our Assessment will include the following components:

- Baseline GHG Emissions Calculations
- Estimate GHG Emissions of Assets
- Net increase / reduction in GHG emissions
- Cost-per-tonne calculations
- Identification of GHG mitigation opportunities

9.4.2 CLIMATE CHANGE RESILIENCE ASSESSMENT

We will procure a qualified assessor (i.e., a professional engineer or GHG Accounting Professional) to conduct the assessment to identify, evaluate and manage risks, resulting in reducing the risk to an acceptable level by enhancing the resilience or adaptability of assets or systems to climate change impacts. They will provide an attestation confirming that the assessment conforms to Infrastructure Canada's Climate Lens Guidance.

The assessment will support more informed decision-making during an infrastructure project's planning and design stages and it will therefore consider the full range of project design choices being made (i.e., location, materials used, construction methods/standards etc.). It will also consider the climate risks during construction and planned operation and maintenance phases and will include asset-specific resilience solutions as well as identify potential upstream and downstream impacts of the proposed solutions within the broader environment. The timescale of our assessment will match the intended lifespan of the asset.

Our assessment will include identification and assessment of climate change risks. Risk will be assessed using the following order and naming convention:

- Climate change hazard
- Impact on asset
- Consequence of impact

9.4.3 ANALYSIS OF RISK, CONSEQUENCES, LIKELIHOOD, AND VULNERABILITY

After identifying and assessing each risk we will conduct an analysis to identify the magnitude of the consequence of an event and its likelihood of occurring. This will be considered in the context of the climate change scenarios being evaluated and the existing controls to manage the risk.

Please find a completed Climate Lens for GHG Change Resilience Assessment from a recent previous project in Appendix 9.1.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9.5 RESILIENCE MEASURES

We will identify which resilience measures have been analyzed and implemented, including the projected change in resilience as a result. We will also justify why particular risks are not being mitigated against and identify any anticipated residual risk flowing mitigation measures (if any). Where possible we will calculate the return on investment of the projects through a Loss Estimation Analysis and a Return on Mitigation Investment calculation.

9.6 OTHER APPLICABLE LAWS, REGULATIONS, AND POLICIES

We have completed a full review of any applicable laws, regulations and policies and have dedicated resources to ensure that our Smart Cities projects meet all requirements under them. We have identified the following applicable laws, regulations and policies:

- Freedom of Information and Protection of Privacy Act
- Local Government Act
- Fire Safety Act (Bill 4)
- Occupational Health and Safety Regulation
- Safety Authority Act
- Safety Standards Act
- Workers Compensation Act
- Environmental Assessment Act
- Information Management Regulation

9.7 RISKS AND MITIGATION

Table 9.7 Implementation Phase Risks and Mitigation

RISK	DESCRIPTION	MITIGATION
Requirements and commitments are not well understood	Projects proceed without knowledge or understanding of commitments and requirements.	Project plans incorporate legislative requirements and other commitments that inform planning, tracking, reporting and implementation impacts.
Non-compliance to commitments made and requirements	As project activities progress, commitments and legislative requirements are missed.	Strong project governance processes that include a compliance log and reporting that specifically track progress against commitments and requirements.
Lack of baseline data and data collection	Baseline data is incomplete or inaccurate and/or data collection against baseline is insufficient or flawed.	Baseline data is approved through the project governance structure and data collection processes are identified, checked and included in project plans and execution documents.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

BRIEFING NOTE TO THE DEPUTY MINISTER

SMART CITIES CHALLENGE FINAL PROPOSAL EVALUATION/REVIEW PROCESS

(For Information)

PURPOSE

- This note provides an overview of the evaluation/review process for the Smart Cities Challenge final proposals (**Annexes A and B**), and outlines considerations and next steps as we move toward the selection of winners and their announcement on May 14, 2019.

HIGHLIGHTS/KEY CONSIDERATIONS

- All final proposals (20) were received on March 5, 2019. To ensure appropriate support to the Smart Cities Challenge Jury, the Smart Cities Challenge Directorate is coordinating technical reviews of these proposals. On parallel tracks, in-depth technical reviews are being undertaken by a contracted external firm (Raymond Chabot Grant Thornton) as well as by the Smart Cities Challenge Directorate in consultation with experts within Infrastructure Canada (INFC) and from other government departments, as required.

- These reviews will result in the creation of support packages for the independent Jury, who will meet to deliberate on two occasions (April 23-24 and May 2-3, 2019) to produce, through consensus, a recommended slate of winners for consideration by the Minister. The purpose of INFC's internal and external review process is not to fully evaluate or rank the merit of the final proposals. The purpose is to provide the Jury and ultimately the Minister with comprehensive and considered summaries of the key strengths and weaknesses of the submissions so that they may take this information into account during their deliberations.

- It is hoped that the Minister could meet with the Jury during one of these deliberation days to thank the members for their service and present them each with an acknowledgement gift.

- The Jury's task is to consider each final proposal against the evaluation criteria published in the Finalist Guide (**Annex C**). At the end of the process, the Jury will reach a consensus score for each of the final proposals. Each finalist will be provided their score in private.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Following the delivery of the recommended slate of winners by the Jury (expected on or shortly after May 3), the department will seek the decision of the Minister through a decision note. Given the timing of the announcement event (May 14, 2019), a quick decision will be required. [redacted]

NEXT STEPS

- The Smart Cities Challenge Directorate's internal and external review process, as well as overall planning and support for the Jury and its deliberations will continue until early May.

- Planning continues for the May 14 finalist showcase and announcement event to be held at the National Arts Centre.

[redacted]

MAR 2 2 2019

Gerard Peets
Assistant Deputy Minister

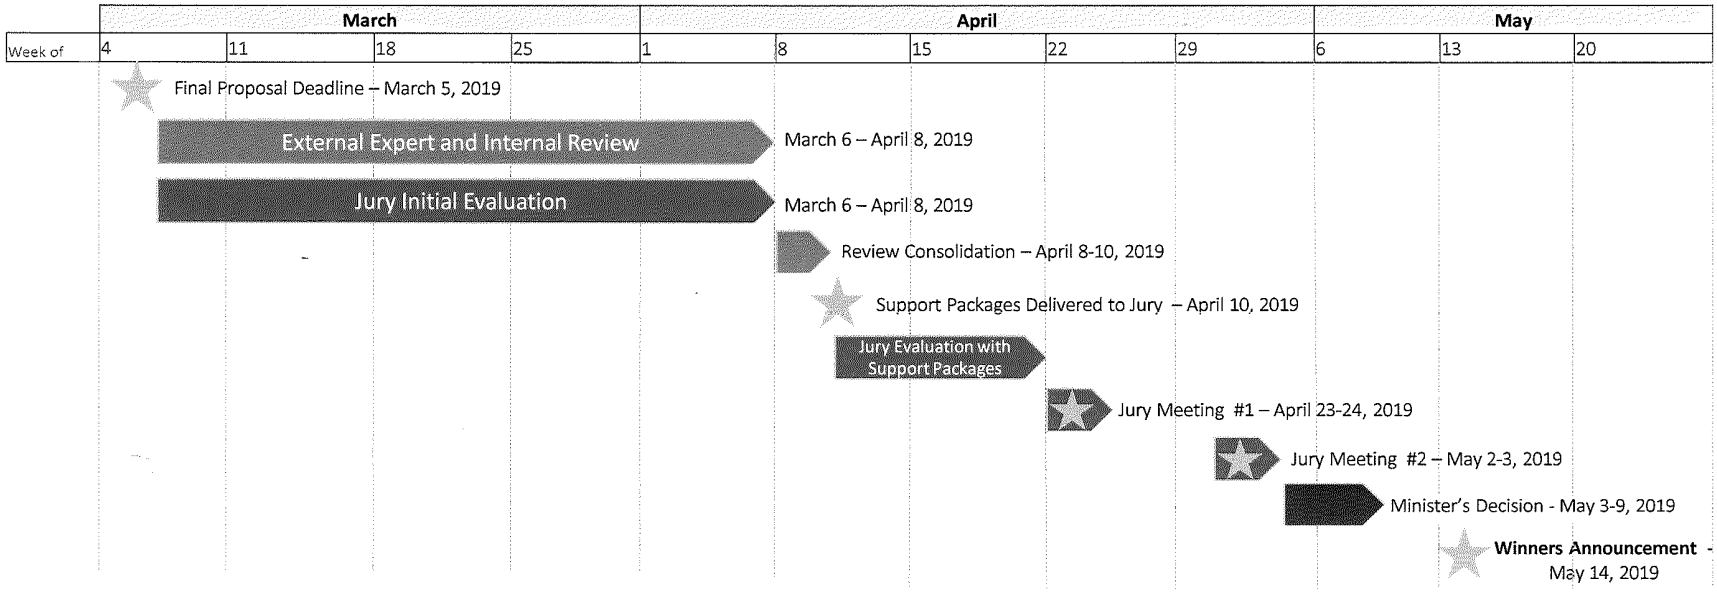
Annex A: Final Proposals Review and Evaluation Process at a Glance
Annex B: Timeline
Annex C: Consolidated Evaluation Criteria (Finalist Guide)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information



Steps	**Key Activities**	**Dates**	**Resources**
The Smart Cities Challenge email/file sharing system application intake closed on March 5th at 11:59 p.m. PST.			
Completeness Screening	***The Smart Cities team conducts a completeness screen, confirming that finalists have submitted all required components of the final proposal*** 1. Completeness checks completed for each final proposal	▪ March 6: Completeness checks completed ▪ March 6: French-language applications sent to translation	▪ INFC Smart Cities team
Preparation for Expert Review and Web Posting	***Final proposals are prepared for internal/external expert review as well as content for posting on the INFC website via the IICP and Smart Cities Challenge online interactive maps*** 1. French-language submissions sent for English translation 2. English-language executive summaries sent for French translation 3. Executive Summaries posted to interactive online maps in both official languages with links to full final proposals and video on finalist website	▪ March 6-8: processing and sending for translation ▪ March 22: target for finalised translations ▪ As soon as possible thereafter: Executive Summaries posted to interactive online maps in both official languages and links	▪ INFC Smart Cities team ▪ INFC IM/IT team ▪ INFC Communications ▪ Translation services
Internal and External Expert Review	***On parallel tracks, reviews of final proposals are undertaken by internal and external experts to create support packages for the Jury:*** • External review: Expert technical reviews are prepared by contracted external firm (Raymond Chabot Grant Thornton (RCGT)) for *Performance Measurement, Project Management, Technology, Governance, Data and Privacy* and *Financial* chapters of the final proposals. • Internal review: *Vision, Engagement* and *Implementation Phase Requirements* chapters are reviewed by the INFC Smart Cities team in consultation with INFC subject matter experts and other government departments (OGDs), if required. 1. Reviews of final proposals are consolidated to produce Jury support packages 2. INFC Smart Cities Review Committee and senior management approve final Jury packages 3. Jury support packages are delivered to the Jury	▪ March 8-April 8: Internal review process ▪ March 6-April 8: External expert review process o March 23: External experts submit interim report and preliminary reviews o April 8: Final report and final reviews received from external experts ▪ April 8-10: Reviews are consolidated and approved ▪ April 10: Review packages provided to Jury	▪ Review Teams from INFC Smart Cities team ($5M, $10 and $50M categories) ▪ Review Committee from INFC Smart Cities staff and management ▪ INFC experts in subject matter domains ▪ Subject matter experts from other government departments ▪ External experts (RCGT)
Jury Evaluation and Deliberation	***The independent Jury evaluates final proposals and deliberates to recommend four winners to the Minister of Infrastructure and Communities*** 1. Jury members evaluate all final proposals using evaluation grids (criteria) 2. Jury members have the opportunity to work collaboratively in assigned working groups prior to in-person deliberations 3. Jury members meet in personon two occasions to deliberate and finalize a potential slate of winners	▪ March 6: Jury receives access to all final proposals ▪ April 10: Jury receives Jury support packages ▪ April 23-24: Jury meets in Ottawa to deliberate ▪ May 2-3: Jury meets in Ottawa to deliberate and recommend slate of winners	▪ Jury Members including Jury Chair ▪ Support INFC Smart Cities team on meeting logistics and coordination
Recommendation and consideration by Minister	***Jury members recommend a slate of potential winners to the Minister of Infrastructure and Communities for approval*** 1. Minister of Infrastructure reviews slate of winners 2. [redacted] 3. Minister approves slate of winners	▪ May 3: Minister receives slate of winners ▪ May 3-8: Minister's consideration [redacted] ▪ May 9: Minister approves slate of winners	▪ Jury Chair ▪ Jury Secretariat ▪ Deputy Minister ▪ Minister's Office ▪ Minister

TIMELINE

REVIEW AND EVALUATION OF SMART CITIES CHALLENGE FINAL PROPOSALS – COMPETITION 1

DRAFT for DISCUSSION

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

APPENDIX 4: CONSOLIDATED REQUIREMENTS & EVALUATION CRITERIA

EXECUTIVE SUMMARY

REQUIREMENTS

Provide an executive summary of your final proposal, including:

- Reiteration of the Challenge Statement
- Overview of the upcoming nine chapters

EVALUATION CRITERIA

N/A

RUBRIC

N/A

CHAPTER 1: VISION

✓ **15 POINTS TOTAL**

REQUIREMENTS

Present your smart cities journey, including:

- How your final proposal carries through the vision laid out in your Challenge Statement and the outcomes in your application, and provides reasonable justification of any variations
- How your outcomes continue to be:
  - reflective of the true needs of the community, as demonstrated through a compelling body of data and evidence and extensive resident engagement
  - ambitious and achievable
  - meaningful for the community and its residents
  - well-suited to a smart cities approach
  - measurable
- Progress towards outcomes that may have been achieved during the finalist phase
- Reasons to be selected as a winner

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Final proposal is driven by the Challenge Statement and carries through the vision laid out in the application:

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Final proposal is transformative, scalable, and replicable within the community and to other communities in Canada:

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 2: PERFORMANCE MEASUREMENT

✓ 25 POINTS TOTAL

REQUIREMENTS

Provide an outcomes-based performance measurement plan for the implementation phase, including:

- Project activities and their links to outputs and outcomes
- Project timelines, deliverables, and milestones that are ambitious yet attainable
- Payment schedule with amounts that are reasonable and rational in the context of project timelines, deliverables, milestones, and prize category
- Qualitative and quantitative performance indicators and related data sources that are meaningful and can measure short, medium, and long-term progress towards outcomes
- Monitoring, reporting, and evaluation strategies and checkpoints for contingencies and course corrections, if necessary
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achieve the outcomes

✓ 10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Plan forms a solid basis for development of outcomes-based contribution agreement

✓ 10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Risk strategy is thorough and adequately addresses key risks

✓ 5 POINTS

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

CHAPTER 3: PROJECT MANAGEMENT

25 POINTS TOTAL

REQUIREMENTS

Provide a project management plan for the implementation phase, including:

- Project scope, scheduling, sequencing, and dependencies
- Resource assessment, including human, materiel, and financial (e.g. workforce capacity, infrastructure readiness, and related initiatives already underway) that are sufficient and appropriate to the achievement of outcomes
- Strategies for:
  - Risk identification and appropriate mitigation
  - Procurement, including alignment with technology and partnership requirements
  - Stakeholders, including analysis of impact and influence
  - Communications, including strategies that promote community involvement and transparency and tailor to diverse stakeholders and projects
- Monitoring, controlling, and reporting strategies and checkpoints for contingencies and course corrections, if necessary
- Approach to sustaining projects beyond the lifecycle of the Challenge, if appropriate
- Other details, as required

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achievement of outcomes

10 POINTS TOTAL

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Plan supports the implementation of projects

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Risk strategy is thorough and adequately addresses key risks

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 4: TECHNOLOGY

✓ 25 POINTS TOTAL

REQUIREMENTS

Provide a technology plan for the implementation phase, including:

- Details about the technologies, including relevant applications elsewhere and results of testing and/or piloting in finalist phase
- Approach to future-proofing the technologies (i.e. safeguards against vendor-generated proprietary constraints and obsolescence, workforce that is able to implement and operate the technologies and systems going forward)
- How the technologies comply with relevant legislative and regulatory requirements
- Adoption or development of standards, architectures, certifications, initiatives, and guidelines, including how these will enable:
  - interoperability between the technologies, other technologies, existing community systems and services, and infrastructure
  - replicability and scalability
- Roles and responsibilities of technology partners
- Accessibility and usability of the technologies to diverse users, residents, and other stakeholders that support their uptake and acceptance
- Identification of risks (e.g. privacy issues, cybersecurity breaches) and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achievement of outcomes

✓ 10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Plan supports the implementation of projects

✓ 10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risk strategy is thorough and adequately addresses key risks

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

CHAPTER 5: GOVERNANCE

✓ **20 POINTS TOTAL**

REQUIREMENTS

Provide a governance plan for the implementation phase, including:

- Governance frameworks and strategies to oversee and manage projects, project risks, funds, and partners that are rigorous, transparent, effective, and provide value for money
- Details about the partners and their role, capacity, and readiness
- Evidence (i.e. letters, agreements, other forms of written understandings) and details about the partnerships, including their nature, terms, accountability structure, and financial arrangements
- Approach to partnerships that retains community control over sensitive and personal data
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achievement of outcomes

10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Plan, including partnerships, supports the implementation of projects

5 POINTS

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risk strategy is thorough and adequately addresses key risks

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

CHAPTER 6: ENGAGEMENT

✓ **30 POINTS TOTAL**

REQUIREMENTS

- Provide an engagement plan for the implementation phase, including:
- Approach to engaging with, gaining acceptance from, and onboarding residents and other stakeholders for projects that ensures ongoing alignment between the outcomes and their concerns and needs
- Insights gained through previous engagement processes with residents that shaped the final proposal in a significant way
- Tools used in past, planned, and ongoing engagement activities that are adapted to target different population groups and encourage ongoing, high participation
- Efforts made to be inclusive and consider the diversity of residents, including the ways in which certain population groups could be positively/negatively and intentionally/unintentionally affected by projects
- Experienced or expected reactions from residents and other stakeholders and approaches for managing potential issues
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Engagement to date and plans to engage residents and other stakeholders in the implementation phase are detailed, complete, inclusive, meaningful, and well-suited to achieve the outcomes

✓ 10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Plan supports the implementation of projects

✓ 5 POINTS

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Diversity and inclusion are reflected in project design, and facilitate the implementation of projects

✓ 10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Risk strategy is thorough and adequately addresses key risks

✓ 5 POINTS

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 7: DATA AND PRIVACY

✓ 25 POINTS TOTAL

REQUIREMENTS

Provide a data management plan for the implementation phase, including:

- Preliminary Privacy Impact Assessment (PIA) or Preliminary Rationale Analysis (PRA) with evidence that relevant privacy authorities were consulted and their guidance was considered in its development
- The ways in which the data management plan complies with Personal Information Protection and Electronic Documents Act (PIPEDA) and other relevant municipal, provincial/territorial, or federal privacy regimes
- Types and methods of data collection, generation, analysis, storage, and transmission, and plans for re-use, re-distribution, derivative production, archiving, and preservation that reflects the entire data lifecycle in project design
- Efforts made to integrate security and privacy considerations into project design, particularly those that were raised by users, residents, and other stakeholders
- Efforts made to adhere to the following principles:
  - Governance: strong governance frameworks and meaningful resident engagement throughout the lifecycle of projects
  - Ownership and control: avoidance of private-sector ownership and control of publicly-sourced data and community-owned and controlled data approaches
  - Consent: respect for meaningful consent in data collection, use, and disclosure
  - Data minimization and de-identification: pursuit of less privacy-invasive alternatives wherever possible and de-identification of all personal information at the earliest opportunity and mitigation of potential for re-identification
  - Accessibility: accessible, interoperable, and open data approaches to drive community-based solutions
  - Security: secure storage and transmission of data and assurance of effective cybersecurity
- Open and big data strategies, including the ways in which they facilitate transferability and replicability of technologies and projects
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plan is detailed, complete, high quality, and well-suited to achievement of outcomes

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Plan supports the implementation of projects

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Open and big data strategies are employed to the extent possible and facilitate transferability and replicability of technologies and projects

✓ 5 POINTS

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Risk strategy is thorough and adequately addresses key risks

1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 8: FINANCIAL

✓ 25 POINTS

REQUIREMENTS

Provide a financial plan for the implementation phase, including:

- Comprehensive project budget with a detailed breakdown of projected revenues, if any, and expenses by year, source, and cost type (including identification of hard and soft as well as direct and indirect costs) that is reasonable, sufficient, and in line with the performance measurement plan
- Methods, sources, and assumptions that result in class B (substantive) estimates of revenues, if any, and expenses at a minimum
- Contributions (financial or in-kind) from other sources, and approach to leverage revenues, if any, and the prize money that amplifies the impact and reach of projects
- Financial tools and accounting methodologies that are appropriate for projects
- Identification of risks and development of appropriate mitigation strategies
- Report on the use of the finalist grant, including reasonable justification of any divergences from the plan laid out in the application
- Other details, as required

EVALUATION CRITERIA

Plan is detailed, complete, high quality, and well-suited to achievement of outcomes

✓ 10 POINTS

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Plan supports the implementation of projects

✓ 5 POINTS

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Report on the use of the finalist grant is detailed, complete, and demonstrates a rational and effective use for the development of the final proposal and sound management of project funding

CHAPTER 9: IMPLEMENTATION PHASE REQUIREMENTS

✓ 10 POINTS TOTAL

REQUIREMENTS

This chapter requires you to identify and provide the plans for meeting applicable municipal, provincial, and federal reporting and legislative and policy requirements should you be selected as a winner.

These requirements are:

- Duty to consult with Indigenous groups
- Modern Treaty obligations
- Community Employment Benefit (CEB)
- Climate Lens Assessment (CLA)
- Other applicable laws and regulations and policies, including any cases of change or exemption to legislation and regulations that may apply to projects

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plans for meeting relevant municipal, provincial, and federal reporting and legislative requirements are provided and serve as sufficient groundwork for the implementation phase should the finalist be selected as a winner

✓ 5 POINTS

Infrastructure Canada Weekly Status Report			
Project Name	Smart Cities Challenge - Finalist Proposals Evaluation		
Date	03/22/2019	**Reporting Period**	03/16/2019 to 03/22/2019

Distribution List:			
Project Authority	**Kathleen Bouchard** **Jenny Tremblay** **Matthew Baird**	**RCGT Project Lead**	**David Seto**

1. Overall Project Status

Scope	Completed adjustments to the Methodology and Project Plan, and Project Charter inclusive of the composition of project teams. Completed Assessment Report #1 (D4A) for [redacted] SME review of remaining 19 proposals ongoing.
Budget	See Appendix A of status report for budget details.
Schedule	Project on schedule.

2. Major Milestones/Deliverables Performance

Milestone / Deliverable	Planned Completion Date	Date Approved by Project Authority	Status (See Legend Below)
Introductory Meeting (D1A)	02/07/2019	02/07/2019	Completed
Preparatory Work (D1B)	03/06/2019	03/09/2019	Completed
Methodology and Project Plan (D2A)	03/01/2019	03/01/2019	Completed
As required: adjustments to the Methodology and Project Plan, inclusive of the composition of project teams, following review of finalist proposals (D2B)	03/12/2019	03/12/2019	Completed
Assessment Report #1 (D4A)	03/22/2019	03/22/2019	Completed
Assessment Reports #2 to #20 (D4B –D4T)	04/08/2019		

- GREEN – On target to achieve Planned Delivery Date.
- AMBER – Planned Target Delivery Date is in danger of not being achieved but a managed solution capable of bringing forward the actual delivery date is being applied.
- RED – Planned Target Delivery Date is not going to be achieved or has already passed. No work rounds or solutions capable

2. Major Milestones/Deliverables Performance			
Milestone / Deliverable	**Planned Completion Date**	**Date Approved by Project Authority**	**Status (See Legend Below)**
of bringing forward the planned dates are available.			

3. Activities & Risks/Issue Monitoring	
Activity Description	**Date of Completion**
Key Activities Completed over the Reporting Period	
Assessment Report #1 [redacted]	03/19/2019
Final Draft Assessment Report #1 [redacted]	03/22/2019
Assessment Report #2 - #20	Ongoing
Key Activities Planned for Next Reporting Period	
Assessment Report #2 - #20	Ongoing

Risks/Issue Management

No.	Risk/Issue Description	Mitigation Strategy	Date Approved by Project Authority
1	Resource availability	RCGT will engage an equally qualified resource from the pool of experts from our national network of resources	02/06/2019
2	Conflicts of Interest	RCGT has already completed Conflict Checks for each of the proposed team members. If additional resources are required, Conflict Checks will be completed prior to any participation in the project. Nationwide Conflict Check underway to identify any potential conflicts of interest between the 20 Finalists and any of our other offices.	02/06/2019

Appendix A

Budget reporting – work completed versus budget spent to date, as at 3/22/2019.

Total Fees (Budget)	Fees Incurred to Date	Travel
$280,500	[redacted]	$0

Poirier2, Eric (INFC)

From:	Poirier2, Eric (INFC)

To:	Williams, Tushara (INFC)
Cc:	Tremblay, Jenny (INFC); Courval, Manon (INFC); Long, Alexander (INFC); Fletcher-Kyle, Ashley (INFC)
Subject:	FOR CONSULTATION: Climate Lens Assessment Plans - Richmond Final Proposal
Attachments:	Smart Cities Challenge - Webinar Presentation - 28Aug2018 (EN).ppt; Richmond Final Proposal - Implementation Phase Requirements.pdf; Consolidated Evaluation Criteria (Finalist Guide).pdf

Bonjour Tushara,

As Jenny mentioned at a recent Branch management meeting, there may be a few Smart Cities Challenge final proposals that require the view of policy experts within INFC or beyond to assist in our review process in support of the Smart Cities Challenge Jury.

The Richmond project is within the scope of application of the Climate Lens Assesment process and they have identified in their final proposal their plans to meet their obligations in this regard. Could your CLA folks have a look and give us some feedback about how this lines up with INFC expectations on a CLA?

We have attached the following:

- Richmond Final Proposal section on CLA for review
- Webinar presentation used to explain obligations to finalists for reference (pages 8-12, specifically)
- Finalist Guide excerpt (criteria relevant to CLA are in Chapter 9) for reference
- The full final proposal is online

Any written views would be most welcome by noon on Friday (if at all possible). We would also be happy to meet with your folks to talk this through.

Au plaisir,
EP

Eric Poirier

Canada

SMART CITIES CHALLENGE

Finalist Webinar #2:

Implementation Phase Requirements

August 28, 2018

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

AGENDA

- Overview
- Community Employment Benefits (CEB)
- Climate Lens Assessment (CLA)
- Duty to Consult and Modern Treaty obligations
- Other applicable laws, regulations and policies
- Communications touch base
- Next steps

Community Employment Benefits (CEB)

COMMUNITY EMPLOYMENT BENEFIT (CEB)

- Encourage communities to diversify recruitment, training and procurement practices
- Gather data on best practices across Canada, highlighting opportunities and challenges faced by construction industry and related sectors
- Results will be reported annually over the course of the project

http://www.infrastructure.gc.ca/pub/other-autre/ceb-ace-eng.html

TARGETED GROUPS

- Groups targeted by the CEB initiative include:
    - Indigenous peoples
    - Women
    - Youth
    - People with disabilities
    - Veterans
    - Recent Immigrants
    - Apprentices
    - Small and Medium Enterprises
    - Social Enterprises

NEXT STEPS FOR FINALISTS

- If selected as a winner, what are your plans for:
  - Identifying target groups that would benefit from your projects as well as goals for each group
  - Reporting on the CEB, including submission timelines
  - Collecting, managing, and tracking the required data
- Remember to reflect these plans in relevant chapters of your final proposal (e.g. project management, engagement, data and privacy, financial)

Q&A

Submit questions using the chat function

Climate Lens Assessment (CLA)

ABOUT THE CLIMATE LENS

- Assess expected greenhouse gas (GHG) emissions and/or resilience to the impacts of climate change
- Applies to winners whose projects have a total value of more than $10 million and have either a climate change adaptation or mitigation focus

http://www.infrastructure.gc.ca/pub/other-autre/cl-occ-eng.html

GREENHOUSE GAS MITIGATION ASSESSMENT

- Measure a project's anticipated GHG emissions impact
- Scope includes direct and significant indirect effects (emissions and reductions)
- Timeline includes construction, operations, and maintenance over the asset's expected life
- [Project Emissions] – [Baseline Emissions] = [Overall Emissions]

CLIMATE CHANGE RESILIENCE ASSESSMENT

- Analysis of future climate conditions and risk treatment
- Plans to projects resilient to future climate conditions and impacts
- Attestation by qualified party

NEXT STEPS FOR FINALISTS

- *If the CLA pertains to you*, and if selected as a winner, what are your plans for:
  - Conducting the CLA, submission timelines, and who would complete/attest to it
  - How much it would cost
  - Collecting, managing, and tracking the required data
- Remember to reflect these plans in relevant chapters of your final proposal (e.g. project management, engagement, data and privacy, financial)
- *If the CLA does not pertain to you*, state that the total cost of projects with a primary focus on climate change adaptation, resilience, disaster mitigation, or a reduction in GHG emissions is less than $10 million

Q&A

Submit questions using the "chat" function

Other applicable laws, regulations and policies

Duty to Consult and Modern Treaty obligations

FINALIST CONSIDERATIONS

- The Finalist Guide lists the Duty to Consult and Modern Treaties as implementation requirements to consider
- These are listed in order to raise awareness and ensure that Finalists take the time to consider whether these may be triggered in the context of their proposal
- Regardless, in the spirit of Reconciliation, we encourage you to engage with any Indigenous peoples in your community
- Indigenous peoples will bring new perspectives, expertise, and interests to your project that you may not have considered

Q&A

Submit questions using the "chat" function

Communications touch-base

NEXT STEPS

- Next webinar: Sept 11, 12:30 p.m. EST
- Reminder: sign and return grant agreements
- Site visit: discuss with Primary Contact potential dates and activities
- Finalist Fall forum: early November (exact date TBD)

IMPLEMENTATION PHASE REQUIREMENTS

Our Smart Cities projects have been planned to address our various requirements and commitments to our residents and other stakeholders. This includes our commitments to meet applicable municipal, provincial, and federal reporting and legislative and policy requirements.

9.1 INDIGENOUS ENGAGEMENT

We recognize the importance of good faith engagement and understand the legal duty to consult for the Provincial and Federal Governments may be triggered by any Crown conduct that may adversely impact any potential or established Aboriginal or Treaty rights. We have established relationships with neighbouring First Nations. These include the Musqueam Indian Band, Tsawwassen First Nation, and Squamish First Nation.

Our engagement procedures support the federal and provincial guidelines, including the federal Aboriginal Consultation and Accommodation – updated Guidelines for Federal Officials to Fulfill the Duty to Consult (March 2011) and the provincial guidelines, Updated Procedures for Meeting Legal Obligations when Consulting with First Nations (May 2012).

The City of Richmond has a long-term relationship with the Musqueam Indian Band. Musqueam representatives have participated on the Advisory Committee for the Smart Cities Challenge. We intend to collaborate to develop technology solutions that can help the Musqueam people as they see fit. By their participation as a member of our Advisory Committee, we want to ensure that the needs and interests of their community are addressed as we move to the implementation phase of the Smart Cities projects.

We have reached out to all three First Nations to begin dialogue on our Smart Cities Challenge program.

9.2 COMMUNITY EMPLOYMENT BENEFIT (CEB)

Richmond is a vibrant, rapidly developing city with a strong economy that has attracted thousands of its residents from around the world. Our population has the highest proportion of immigrants of any city in Canada. 74% of our population originates from Asia-Pacific countries with at least 54% speaking a language other than English or French at home. The City recognizes the importance of reflecting this cultural diversity in our workforce in order to effectively serve the diverse needs of the community, through the award winning Human Resources program for people with disabilities.

To support our commitment to workplace diversity, the City of Richmond offers a variety of intercultural awareness training initiatives to increase the level of employee awareness and understanding within the workforce. We employ two full-time diversity coordinators and we are working to incorporate diversity and cultural awareness as part of our Respectful Workplace Policy. Richmond also provides a new immigrant welcome package, in multiple languages, to help new residents tap into the wide range of support services offered.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9.2 COMMUNITY EMPLOYMENT BENEFIT (CEB)

Promotion of diversity is demonstrated through:

- Applying different problem solving skills towards a common goal
- Building relationships with different community groups
- Embracing diverse perspectives and approaches that foster innovation
- Guiding decision making and planning through inclusion, cooperation, dynamism, integration, and equality
- Providing equal opportunity in all areas of our work
- Implementing systems and procedures that consider individual differences in all aspects of our service and planning delivery

We are committed to participate in Infrastructure Canada's Community Employment Benefits Initiative. We already have a strong commitment to workplace diversity and are dedicated to continue our diversity strategy with our Smart Cities Projects. We will continue to provide employment and/or procurement opportunities to the groups targeted by the CEB initiative including apprentices; Indigenous peoples; women; persons with disabilities; veterans; youth; recent immigrants; and small-sized, medium-sized and social enterprises. We will establish specific targets for our projects, allowing for flexibility to consider various factors such as complementing our existing employment initiatives and our local labour market dynamics.

9.3 REPORTING

We will provide Infrastructure Canada with our benefit targets for the federal target groups listed above. This will be completed as soon as possible after the Challenge award outcome. We will report annually on our progress against the targets for each project which will include the number of hours worked by a target population and/or the value of contracts provided to target groups. We will identify key successes as well as any challenges in attempting to meet the project targets. We have assigned a dedicated resource who will collect, manage and track the required data to report against our targets.

9.4 CLIMATE LENS ASSESSMENT

The City of Richmond has a strong commitment to addressing and mitigating climate change. The City has achieved carbon neutral status annually since 2013 and anticipates maintaining that status for the foreseeable future. From 2007 to 2015, the City reduced Greenhouse Gas emissions by 12%, despite a population growth of 12% in the same period.

We are committed to undertaking a comprehensive Climate Lens Assessment to provide meaningful insight into the climate impacts of individual projects and to ensure consistency with shared federal, provincial and territorial objectives articulated in the Pan-Canadian Framework for Clean Growth and Climate Change.

As our project has both climate change mitigation and climate change adaptation, resilience and disaster mitigation elements, we will conduct both requirements under the Climate Lens Assessment: the GHG Mitigation Assessment and the Climate Change Resilience Assessment.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9.4.1 GREENHOUSE GAS MITIGATION ASSESSMENT

We will procure a qualified assessor (i.e., a professional engineer or GHG Accounting Professional) to conduct the assessment who will provide an attestation confirming that the assessment conforms to the guidance provided by Infrastructure Canada and aligns with the relevant assessment standard. Our Mitigation Assessments will consider the same greenhouse gases tracked through Canada's National Inventory Report and will include all direct and all significant indirect emissions. We will assess each project across the construction and operations and maintenance phases, and will include estimates of a project's cumulative construction and operations and maintenance emissions over the useful lifespan of the infrastructure.

Our Assessment will include the following components:

- Baseline GHG Emissions Calculations
- Estimate GHG Emissions of Assets
- Net increase / reduction in GHG emissions
- Cost-per-tonne calculations
- Identification of GHG mitigation opportunities

9.4.2 CLIMATE CHANGE RESILIENCE ASSESSMENT

We will procure a qualified assessor (i.e., a professional engineer or GHG Accounting Professional) to conduct the assessment to identify, evaluate and manage risks, resulting in reducing the risk to an acceptable level by enhancing the resilience or adaptability of assets or systems to climate change impacts. They will provide an attestation confirming that the assessment conforms to Infrastructure Canada's Climate Lens Guidance.

The assessment will support more informed decision-making during an infrastructure project's planning and design stages and it will therefore consider the full range of project design choices being made (i.e., location, materials used, construction methods/standards etc.). It will also consider the climate risks during construction and planned operation and maintenance phases and will include asset-specific resilience solutions as well as identify potential upstream and downstream impacts of the proposed solutions within the broader environment. The timescale of our assessment will match the intended lifespan of the asset.

Our assessment will include identification and assessment of climate change risks. Risk will be assessed using the following order and naming convention:

- Climate change hazard
- Impact on asset
- Consequence of impact

9.4.3 ANALYSIS OF RISK, CONSEQUENCES, LIKELIHOOD, AND VULNERABILITY

After identifying and assessing each risk we will conduct an analysis to identify the magnitude of the consequence of an event and its likelihood of occurring. This will be considered in the context of the climate change scenarios being evaluated and the existing controls to manage the risk.

Please find a completed Climate Lens for GHG Change Resilience Assessment from a recent previous project in Appendix 9.1.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

9.5 RESILIENCE MEASURES

We will identify which resilience measures have been analyzed and implemented, including the projected change in resilience as a result. We will also justify why particular risks are not being mitigated against and identify any anticipated residual risk flowing mitigation measures (if any). Where possible we will calculate the return on investment of the projects through a Loss Estimation Analysis and a Return on Mitigation Investment calculation.

9.6 OTHER APPLICABLE LAWS, REGULATIONS, AND POLICIES

We have completed a full review of any applicable laws, regulations and policies and have dedicated resources to ensure that our Smart Cities projects meet all requirements under them. We have identified the following applicable laws, regulations and policies:

- Freedom of Information and Protection of Privacy Act
- Local Government Act
- Fire Safety Act (Bill 4)
- Occupational Health and Safety Regulation
- Safety Authority Act
- Safety Standards Act
- Workers Compensation Act
- Environmental Assessment Act
- Information Management Regulation

9.7 RISKS AND MITIGATION

Table 9.7 Implementation Phase Risks and Mitigation

RISK	DESCRIPTION	MITIGATION
Requirements and commitments are not well understood	Projects proceed without knowledge or understanding of commitments and requirements.	Project plans incorporate legislative requirements and other commitments that inform planning, tracking, reporting and implementation impacts.
Non-compliance to commitments made and requirements	As project activities progress, commitments and legislative requirements are missed.	Strong project governance processes that include a compliance log and reporting that specifically track progress against commitments and requirements.
Lack of baseline data and data collection	Baseline data is incomplete or inaccurate and/or data collection against baseline is insufficient or flawed.	Baseline data is approved through the project governance structure and data collection processes are identified, checked and included in project plans and execution documents.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

APPENDIX 4: CONSOLIDATED REQUIREMENTS & EVALUATION CRITERIA

EXECUTIVE SUMMARY

REQUIREMENTS

Provide an executive summary of your final proposal, including:

- Reiteration of the Challenge Statement
- Overview of the upcoming nine chapters

EVALUATION CRITERIA

N/A

RUBRIC

N/A

CHAPTER 1: VISION

✓ **15 POINTS TOTAL**

REQUIREMENTS

Present your smart cities journey, including:

- How your final proposal carries through the vision laid out in your Challenge Statement and the outcomes in your application, and provides reasonable justification of any variations
- How your outcomes continue to be:
  - reflective of the true needs of the community, as demonstrated through a compelling body of data and evidence and extensive resident engagement
  - ambitious and achievable
  - meaningful for the community and its residents
  - well-suited to a smart cities approach
  - measurable
- Progress towards outcomes that may have been achieved during the finalist phase
- Reasons to be selected as a winner

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Final proposal is driven by the Challenge Statement and carries through the vision laid out in the application:

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Final proposal is transformative, scalable, and replicable within the community and to other communities in Canada:

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 2: PERFORMANCE MEASUREMENT

✓ **25 POINTS TOTAL**

REQUIREMENTS

Provide an outcomes-based performance measurement plan for the implementation phase, including:

- Project activities and their links to outputs and outcomes
- Project timelines, deliverables, and milestones that are ambitious yet attainable
- Payment schedule with amounts that are reasonable and rational in the context of project timelines, deliverables, milestones, and prize category
- Qualitative and quantitative performance indicators and related data sources that are meaningful and can measure short, medium, and long-term progress towards outcomes
- Monitoring, reporting, and evaluation strategies and checkpoints for contingencies and course corrections, if necessary
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achieve the outcomes

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Plan forms a solid basis for development of outcomes-based contribution agreement

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Risk strategy is thorough and adequately addresses key risks

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 3: PROJECT MANAGEMENT

25 POINTS TOTAL

REQUIREMENTS

Provide a project management plan for the implementation phase, including:

- Project scope, scheduling, sequencing, and dependencies
- Resource assessment, including human, materiel, and financial (e.g. workforce capacity, infrastructure readiness, and related initiatives already underway) that are sufficient and appropriate to the achievement of outcomes
- Strategies for:
  - Risk identification and appropriate mitigation
  - Procurement, including alignment with technology and partnership requirements
  - Stakeholders, including analysis of impact and influence
  - Communications, including strategies that promote community involvement and transparency and tailor to diverse stakeholders and projects
- Monitoring, controlling, and reporting strategies and checkpoints for contingencies and course corrections, if necessary
- Approach to sustaining projects beyond the lifecycle of the Challenge, if appropriate
- Other details, as required

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achievement of outcomes

10 POINTS TOTAL

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Plan supports the implementation of projects

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Risk strategy is thorough and adequately addresses key risks

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 4: TECHNOLOGY

25 POINTS TOTAL

REQUIREMENTS

Provide a technology plan for the implementation phase, including:

- Details about the technologies, including relevant applications elsewhere and results of testing and/or piloting in finalist phase
- Approach to future-proofing the technologies (i.e. safeguards against vendor-generated proprietary constraints and obsolescence, workforce that is able to implement and operate the technologies and systems going forward)
- How the technologies comply with relevant legislative and regulatory requirements
- Adoption or development of standards, architectures, certifications, initiatives, and guidelines, including how these will enable:
  - interoperability between the technologies, other technologies, existing community systems and services, and infrastructure
  - replicability and scalability
- Roles and responsibilities of technology partners
- Accessibility and usability of the technologies to diverse users, residents, and other stakeholders that support their uptake and acceptance
- Identification of risks (e.g. privacy issues, cybersecurity breaches) and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achievement of outcomes

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Plan supports the implementation of projects

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risk strategy is thorough and adequately addresses key risks

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

CHAPTER 5: GOVERNANCE

✓ **20 POINTS TOTAL**

REQUIREMENTS

Provide a governance plan for the implementation phase, including:

- Governance frameworks and strategies to oversee and manage projects, project risks, funds, and partners that are rigorous, transparent, effective, and provide value for money
- Details about the partners and their role, capacity, and readiness
- Evidence (i.e. letters, agreements, other forms of written understandings) and details about the partnerships, including their nature, terms, accountability structure, and financial arrangements
- Approach to partnerships that retains community control over sensitive and personal data
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plan is detailed, complete, feasible, and well-suited to achievement of outcomes

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Plan, including partnerships, supports the implementation of projects

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risk strategy is thorough and adequately addresses key risks

- **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses

3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

CHAPTER 6: ENGAGEMENT

- **30 POINTS TOTAL**

REQUIREMENTS

- Provide an engagement plan for the implementation phase, including:
- Approach to engaging with, gaining acceptance from, and onboarding residents and other stakeholders for projects that ensures ongoing alignment between the outcomes and their concerns and needs
- Insights gained through previous engagement processes with residents that shaped the final proposal in a significant way
- Tools used in past, planned, and ongoing engagement activities that are adapted to target different population groups and encourage ongoing, high participation
- Efforts made to be inclusive and consider the diversity of residents, including the ways in which certain population groups could be positively/negatively and intentionally/unintentionally affected by projects
- Experienced or expected reactions from residents and other stakeholders and approaches for managing potential issues
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Engagement to date and plans to engage residents and other stakeholders in the implementation phase are detailed, complete, inclusive, meaningful, and well-suited to achieve the outcomes

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Plan supports the implementation of projects

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing
2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Diversity and inclusion are reflected in project design, and facilitate the implementation of projects

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Risk strategy is thorough and adequately addresses key risks

2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 7: DATA AND PRIVACY

✓ **25 POINTS TOTAL**

REQUIREMENTS

Provide a data management plan for the implementation phase, including:

- Preliminary Privacy Impact Assessment (PIA) or Preliminary Rationale Analysis (PRA) with evidence that relevant privacy authorities were consulted and their guidance was considered in its development
- The ways in which the data management plan complies with Personal Information Protection and Electronic Documents Act (PIPEDA) and other relevant municipal, provincial/territorial, or federal privacy regimes
- Types and methods of data collection, generation, analysis, storage, and transmission, and plans for re-use, re-distribution, derivative production, archiving, and preservation that reflects the entire data lifecycle in project design
- Efforts made to integrate security and privacy considerations into project design, particularly those that were raised by users, residents, and other stakeholders
- Efforts made to adhere to the following principles:
  - Governance: strong governance frameworks and meaningful resident engagement throughout the lifecycle of projects
  - Ownership and control: avoidance of private-sector ownership and control of publicly-sourced data and community-owned and controlled data approaches
  - Consent: respect for meaningful consent in data collection, use, and disclosure
  - Data minimization and de-identification: pursuit of less privacy-invasive alternatives wherever possible and de-identification of all personal information at the earliest opportunity and mitigation of potential for re-identification
  - Accessibility: accessible, interoperable, and open data approaches to drive community-based solutions
  - Security: secure storage and transmission of data and assurance of effective cybersecurity
- Open and big data strategies, including the ways in which they facilitate transferability and replicability of technologies and projects
- Identification of risks and development of appropriate mitigation strategies
- Other details, as required

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plan is detailed, complete, high quality, and well-suited to achievement of outcomes

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed

1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 8: FINANCIAL

✓ **25 POINTS**

REQUIREMENTS

Provide a financial plan for the implementation phase, including:

- Comprehensive project budget with a detailed breakdown of projected revenues, if any, and expenses by year, source, and cost type (including identification of hard and soft as well as direct and indirect costs) that is reasonable, sufficient, and in line with the performance measurement plan
- Methods, sources, and assumptions that result in class B (substantive) estimates of revenues, if any, and expenses at a minimum
- Contributions (financial or in-kind) from other sources, and approach to leverage revenues, if any, and the prize money that amplifies the impact and reach of projects
- Financial tools and accounting methodologies that are appropriate for projects
- Identification of risks and development of appropriate mitigation strategies
- Report on the use of the finalist grant, including reasonable justification of any divergences from the plan laid out in the application
- Other details, as required

EVALUATION CRITERIA

Plan is detailed, complete, high quality, and well-suited to achievement of outcomes

✓ **10 POINTS**

RUBRIC	
10	Exemplary demonstration with no weaknesses
8	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
6	Reasonably good demonstration on most aspects with some weaknesses that need addressing
4	Some good aspects, some questionable/weak demonstrations that need to be addressed
2	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Plan supports the implementation of projects

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses

2	Some good aspects, some questionable/weak demonstrations that need to be addressed
1	Several serious weaknesses on crucial aspects and some unsatisfactory demonstrations
0	No demonstration

CHAPTER 9: IMPLEMENTATION PHASE REQUIREMENTS

✓ **10 POINTS TOTAL**

REQUIREMENTS

This chapter requires you to identify and provide the plans for meeting applicable municipal, provincial, and federal reporting and legislative and policy requirements should you be selected as a winner.

These requirements are:

- Duty to consult with Indigenous groups
- Modern Treaty obligations
- Community Employment Benefit (CEB)
- Climate Lens Assessment (CLA)
- Other applicable laws and regulations and policies, including any cases of change or exemption to legislation and regulations that may apply to projects

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EVALUATION CRITERIA

Plans for meeting relevant municipal, provincial, and federal reporting and legislative requirements are provided and serve as sufficient groundwork for the implementation phase should the finalist be selected as a winner

✓ **5 POINTS**

RUBRIC	
5	Exemplary demonstration with no weaknesses
4	Very good demonstration on virtually all aspects, some weaknesses of modest consequence
3	Reasonably good demonstration on most aspects with some weaknesses that need addressing

Hi Meredith, thanks for following up. We would certainly be interested in any findings your team will come across in your reviews.
While in the short term we are focussed on supporting the jury in their evaluation, we are certainly interested in learning what industry experts such as yourselves are finding.

Let's stay in touch!
Kathleen

Kathleen,

Many apologies on the disconnect and the delay in responding. I was under the assumption that comments had been requested from you.

Thanks so much for forwarding the links. We will do a review of the proposals regardless of a formal request. As we have discussed previously, 'smart cities' touches on a number of files our branch works on including: connected and automated vehicles, zero-emission vehicles, cybersecurity, 5G, artificial intelligence, and shared mobility.

Should we have any comments of note, do you want us to forward these to you as a courtesy?

Meredith

Subject: Smart Cities Final Proposals

Hi Meredith, all the applications can be found online as the finalists posted them on their websites (as well as short videos).

At this time Infrastructure Canada is not seeking revisions or assessments from other departments so we don't have any timelines to provide on that side. Attached, you will find our consolidation of weblinks that will take you to each of the 20 final proposals for you own interest ☺

Feel free to give me a ring if you have any questions.

Subject: FW: sommaire des finalistes

Kathleen,

I have been asked by my Director General to review the Smart Cities Challenge Fund applications from an automotive perspective and to provide comments. I was told that the best source of information on the applications was look at the applicant websites. Is there a more formalized process for locating the applicant information. I know previously there was a portal that we were provided access too as part of the initial review process.

Any help you could provide along with applicable deadlines would be sincerely appreciated.

Meredith

Subject: FW: sommaire des finalistes

Bonjour Claude, merci beaucoup de partagé votre analyse révélatrice avec nous. Ce sera très intéressant de voir comment les communautés iront de l'avant pour faire avancer leurs projets.
Les prochains mois dévoileront sans doutes d'autres informations intéressante en lien avec la mise en œuvre de projets innovateurs entre autres le fonctionnement de la gouvernance et l'application ententes de contribution basés sur la performance etc...

En ce qui a trait à la prochaine étape des évaluations, compte tenu de la quantité de détails et l'ampleur des propositions finales, nous avons fait appel à une firme externe pour aider avec les analyses. (Raymond Chabot Grant Thornton).

En passant... l'annonce des gagnants aura lieu lors d'un évènement, le 14 mai au Centre National des arts. Notre sous-ministre communiquera sous peu avec les autres départements pour les invitations ☺ Je te tiens au courant.

Subject: sommaire des finalistes

Bonjour Kathleen,

Je te fais suivre à titre d'intérêt, une copie du sommaire (pour notre utilisation interne) des technologies et des partenaires qui ont été soulevés dans les propositions finales des participants du Défi des villes intelligentes. J'observe que la majorité des technologies citées par les participants sont celles reliées à L'internet des choses (IoT), l'intelligence artificielle (AI) et le « big data ». Étonnamment, il y a peu d'entreprises canadiennes œuvrant dans ces domaines qui sont identifiés comme partenaires!

Aussi, comptez-vous avoir recours des évaluateurs externes pour les prochaines étapes?

Salutations,

Claude

Bonjour Tushara,

As Jenny mentioned at a recent Branch management meeting, there may be a few Smart Cities Challenge final proposals that require the view of policy experts within INFC or beyond to assist in our review process in support of the Smart Cities Challenge Jury.

The Richmond project is within the scope of application of the Climate Lens Assesment process and they have identified in their final proposal their plans to meet their obligations in this regard. Could your CLA folks have a look and give us some feedback about how this lines up with INFC expectations on a CLA?

We have attached the following:

- Richmond Final Proposal section on CLA for review
- Webinar presentation used to explain obligations to finalists for reference (pages 8-12, specifically)
- Finalist Guide excerpt (criteria relevant to CLA are in Chapter 9) for reference
- The full final proposal is online

Any written views would be most welcome by noon on Friday (if at all possible). We would also be happy to meet with your folks to talk this through.

Subject: FOR CONSULTATION: Climate Lens Assessment Plans - Richmond Final Proposal

Bonjour Tushara,

As Jenny mentioned at a recent Branch management meeting, there may be a few Smart Cities Challenge final proposals that require the view of policy experts within INFC or beyond to assist in our review process in support of the Smart Cities Challenge Jury.

The Richmond project is within the scope of application of the Climate Lens Assesment process and they have identified in their final proposal their plans to meet their obligations in this regard. Could your CLA folks have a look and give us some feedback about how this lines up with INFC expectations on a CLA?

We have attached the following:

- Richmond Final Proposal section on CLA for review
- Webinar presentation used to explain obligations to finalists for reference (pages 8-12, specifically)
- Finalist Guide excerpt (criteria relevant to CLA are in Chapter 9) for reference
- The full final proposal is online

Any written views would be most welcome by noon on Friday (if at all possible). We would also be happy to meet with your folks to talk this through.

Au plaisir,
EP

Hi Chad,

Thanks for your assessment of Richmond's plans re climate lens assessment. Unfortunately the online version does not contain the appendices. I've attached the CLA referenced in the proposal and contained in the appendix. This would address your second point and perhaps your third. Could you take a quick look and let me know if you see any concerns and/or gaps in the assessment?

Thanks – and have a great weekend!

Alex

Bonjour ADMO colleagues,

Please see the answer below to the Deputy's question.

Cheers,

Jenny
****

The points-based criteria and guide used by the Smart Cities Challenge Jury to evaluate the final proposals are public and can be found in Appendix 4 (pg. 34-53) of the Finalist Guide (please see https://impact.canada.ca/en/challenges/smart-cities/finalist-guide).

While a dedicated document that explains the step-by-step stages of the evaluation process is not public, a description of the core approach is publicly available. The Impact Canada website (please see https://impact.canada.ca/en/challenges/smart-cities/process) explains that final proposals will be reviewed by experts and then evaluated by the Smart Cities Challenge Jury. Evaluations will focus on project feasibility, strength of the business case, and clear links to the outcomes established in the Challenge Statement, with the Jury helping to select winners by Spring 2019.

The Finalists were provided with more detailed information via the final finalist FAQ communication prior to the deadline. This included information on the external expert reviews (Raymond Chabot Grant Thornton contract), the process/timing for the Jury to ask questions to finalists, the individual work of Jury members as well as the fact that there would be two in-person Jury deliberations.

PROTECTED A

BRIEFING NOTE TO THE DEPUTY MINISTER

SMART CITIES CHALLENGE FINAL PROPOSAL EVALUATION/REVIEW PROCESS

(For Information)

good work to the process + evaluation guide public =)

PURPOSE

- This note provides an overview of the evaluation/review process for the Smart Cities Challenge final proposals (**Annexes A and B**), and outlines considerations and next steps as we move toward the selection of winners and their announcement on May 14, 2019.

HIGHLIGHTS/KEY CONSIDERATIONS

- All final proposals (20) were received on March 5, 2019. To ensure appropriate support to the Smart Cities Challenge Jury, the Smart Cities Challenge Directorate is coordinating technical reviews of these proposals. On parallel tracks, in-depth technical reviews are being undertaken by a contracted external firm (Raymond Chabot Grant Thornton) as well as by the Smart Cities Challenge Directorate in consultation with experts within Infrastructure Canada (INFC) and from other government departments, as required.

- These reviews will result in the creation of support packages for the independent Jury, who will meet to deliberate on two occasions (April 23-24 and May 2-3, 2019) to produce, through consensus, a recommended slate of winners for consideration by the Minister. The purpose of INFC's internal and external review process is not to fully evaluate or rank the merit of the final proposals. The purpose is to provide the Jury and ultimately the Minister with comprehensive and considered summaries of the key strengths and weaknesses of the submissions so that they may take this information into account during their deliberations.

- It is hoped that the Minister could meet with the Jury during one of these deliberation days to thank the members for their service and present them each with an acknowledgement gift.

- The Jury's task is to consider each final proposal against the evaluation criteria published in the Finalist Guide (**Annex C**). At the end of the process, the Jury will reach a consensus score for each of the final proposals. Each finalist will be provided their score in private.

Hi Eric,

At this point, as we discussed at our last meeting, it might make sense for each assessment team to do a final review of their assessments (e.g. neutral language, not using superlatives), and then have a different team with fresh eyes do a high-level review and suggest any changes/revisions. Depending on people's bandwidth, Susan and I could probably get the $10M review done by Thursday for another team to review by early next week. Would be good to know others' ability to do the final review of their own proposals and make time to review another set of proposals.

Subject: Finalist Proposal Assessment – Update and Logistics

Dear Jury Members:

As we've in the midst of our internal and third party expert assessment of the final proposals, I wanted to make sure that you're able to access the final proposals on Central Collab. If you haven't yet had a chance to view the proposals, the instructions for accessing them can be found in my e-mail of March 7 (attached). And if you're having any difficulties in accessing the proposals, please let me know and my team will get back to you to resolve any issues.

Otherwise, my team will be contacting you shortly on a few matters:

- Working with you to look for convenient dates/times for your smaller working group conference call(s).

- Booking travel! Our colleague Vicki McKenzie (vicki.mckenzie@canada.ca) will reach out to arrange your travel. It would greatly help us at Infrastructure Canada if we could make as many bookings as possible before March 31, 2019.

- Updating your online profiles to reflect any required changes. Alex Long (alexander.long@canada.ca) is your contact for this.

As always, let me know if you have any questions or concerns.

Regards,
Jenny

Subject: Final Smart Cities Challenge proposals available for download

Dear Smart Cities Jury Members,

As the Secretary to the Jury, it is my pleasure and privilege to let you know that the Smart Cites Challenge Finalist Proposals and tools for your evaluation are now accessible on Central Collab. As we mentioned on the call last week, the sharing platform now allows you to download all materials at once rather than individually. Instructions on accessing Central Collab and a description of the content available follow at the end of this message.

A few reminders:

- **Confidential info:** Please be mindful of the sensitive nature of some of the content. We tagged confidential components with "CONF" to denote their careful treatment due to privacy analyses, confidential commercial or other sensitive information entrusted to us by finalists and/or partners.
- **Discretion:** A respectful reminder of the need to be discrete and secretive about your notes, views, comments, etc., other than with your Jury colleagues and the INFC Secretariat supporting you.
- **Fairness:** While documents from finalists proposals are starting to be posted by finalists, please only evaluate the versions provided by INFC in case finalists make modifications or add information for the benefit of their residents.
- **Support:** The team will be reaching out to you in the next week to start finding time for working group discussions that may work for you.
- **Travel:** please do not hesitate to contact Vicki McKenzie on our team to help you book deliberation travel. The sooner booked, the better travel choices will be available to you.
- **Information to come:** Translations of two final proposals are expected by March 18. We will also circulate by email the links to the finalist videos once they are all on the finalists' websites.

I look forward to continuing to support you in your important task,

Jenny Tremblay

****

HOW TO ACCESS

Step 1: Accessing the proposals:

- Sign in to Central Collab
- If you don't remember your login info click on FORGOT YOUR PASSWORD OR USERNAME
- If you have any issues, contact Kathleen Bouchard through email or at (613)790-1838.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Step 2: Downloading the files

[redacted]

ATIA - 16(2)

Step 3: Unzipping the Final Proposals

- Once saved onto your computer, you may have to unzip the folder to access the files.
  - MacOS: The file should automatically be unzipped into the same folder when you open it.
  - Microsoft Windows 10: Select the zipped folder and the "Compressed Folder Tools" should appear above. Select "Extract all" to unzip the files.

  - Microsoft Windows 7/8: Right-click the zipped folder and select "Extract All..." to unzip the files.
  -
  - If you are not running on the above operating systems, you may need to download an appropriate software, such as WinZIP.

Content:

20 Finalist sub-folders, each containing files specific to a finalist. You will notice that not all finalists have items under #2 and #4, these were not a requirement.

1. Finalist Proposal
2. Letters of support
3. Privacy Impact Assessments
4. Confidential Annex

- Jury Evaluation Grid.xslx for early scoring and comments (instruction and assignments in tabs)
- Process and Calendar
- Priority Assignment List
- Finalist Guide (English and French)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Subject: Re: Nunavut Proposal Follow-up

Hi Alex,

[redacted]

Just wondering if this summary was ok for your purposes? Do you need it any other format?
I have incorporated it into the full proposal and attached it here, in case you wanted a revised copy for public use. I also fixed some formatting errors and a typo or two. This attachment does not contain letters of support, so it wouldn't be appropriate for the jury (and I know that we are not allowed to add or edit anything for their purposes), but this would be a neater document for public display, and it is the one on our website now. You do not need to use it if you don't want to/against protocol - but let me know if there are any issues in us having this one on our website?

Thanks.

Subject: Late Letter of Support

Hi Alex,
We are still missing one letter of support that was promised to us by last week but that we still haven't received – it's been held up within the partner organization, though we've been assured that we will be receiving it. Would it be possible to deliver that missing letter to SCC when we receive it later this week? Our only alternative is to remove all references to it in our application.
Thanks,
Leon

- **Katinnganiq: Commuity, Connectivty, and Digital Access for Life Promotion in Nunavut**

1) Description of the Initiative: Provide a summary of the program, project activity or system, describe its purposes, goals and objectives. Explain the need for the new program, project or system and its benefits.

The *Katinnganiq: Community, Connectivity, and Digital Access for Life Promotion in Nunavut* is a proposal being submitted to the Smart Cities Challenge competition by the Nunavut Association of Municipalities (in collaboration with Pinnguaq Association, Embrace Life Council, and Qaujigiartiit Health Research Centre) on behalf of the 25 municipalities of Nunavut. The goal of the proposal is to implement protective and preventative measures to reduce the risk of suicide in Nunavut, which is ten times the national average, and increase the amount and accessibility of peer support networks, educational resources and creative outlets that promote positive Mental Health to all Nunavummiut.

Our goal to promote life and positive mental health for young Nunavummiut is sought by increasing protective factors and contributing to social equity through community makerspaces that nurture wellbeing while addressing the digital divide in the North. As articulated in our challenge statement, we seek to increase the availability and accessibility of life promoting activities, resources and support systems like peer networks, educational initiatives and creative outlets to all Nunavummiut in the expanded field of data and technology.

The purpose of the Makerspaces initiative is to build youth resilience to embrace the future with confidence, armed with new coping skills and tools, and supported by positive relationships. The central focus of Makerspaces is on 'protective factors', where youth will build a personal sense of belonging, meaning, purpose and hope through their participation in activities. This initiative will provide safe, nurturing, welcoming social hubs for Nunavummiut that:

- **Provide imaginative and engaging programs:** including recreational, extra-curricular learning and skills acquisition (leadership, technology, interpersonal), the arts (performance, visual, music), traditional cultural/ language activities, peer mentoring, Elder mentoring, and coaching.

- **Leverage digital connectivity** where youth have opportunities to connect within communities and across Nunavut's 25 hamlets, share knowledge with each other and express themselves through access to digital tools and technological know-how utilizing new telecommunications technology. Specifically, this concerns development of a digital platform for the Katinnganiq Makerspace Network (KMN) to support social connections and supportive peer networks

- **Integrate community support**, including wellness services, where youth can access social/community services delivered on a 'whole person' basis in Makerspaces. We expect each Makerspace to be a connection to local mental health resources through staff trained in ASIST (Applied Suicide Intervention Skills Training) and Trauma informed practice - as well as a direct connection to other resources offered by the Embrace Life Council and local counselling services.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2) **Scope of this PIA:** Explain what part or phase of the initiative the PIA covers and what it does not cover.

This is a preliminary PIA that outlines where we see potential privacy implications and how we will address them throughout this initiative. Feedback from the Privacy Commissioner of Nunavut will be sought and considered. If selected as winners, we will continue to work with the office of the Privacy Commissioner of Nunavut to develop a fully fleshed out PIA.

3) **Elements of Information or Data**: List the personal information data elements involved in the initiative. This could include citizen's name, age, address,educational history, work status, health information, financial information, photos, comments on a blog, license numbers or hiring data.

- Name
- Age
- E-mail address (and other contact information like telephone numbers)
- Name of parent or guardian
- Phone number of parent or guardian
- Food allergy information (Allergies? Anaphylactic? Symptoms, Warning signs)
- Network username
- Individuals own art/work
- User-generated data on a closed online forum (text-based messages, photos, code, art projects)
- Opinions and thoughts given through consultation and evaluation efforts (includes surveys, one-on-one interviews, sharing circles, journaling, voice recordings, videos, participants observation, descriptive reports), as well as personal demographic information such as age, race, gender and ethnicity) that relate to the KPI's outlined in chapter 3: performance measurement.

4) **Description of Information Flow (include text and diagram)**: Attach an information flow diagram showing how information will be collected and disclosed as a result of the initiative.

The collection, use, and disclosure of personal information for this initiative will be contained to four main areas and will be sought, as much as possible, though written and informed consent. The four main areas are:

- Makerspace Registration:

To participate in a makerspace, an individual will be requested to register by providing personal information (their name and age) to sign a liability waver and allergy form. Individuals will be asked to read the code of conduct and waiver form for use of the space – and provide their name, age, and signature, (or if a minor, the name and signature of their parent or guardian). Since a makerspace may on occasion serve snacks and food, Individuals or their parents/guardians will also be asked to fill out an allergy form, disclosing any known food allergies and instructions to inform staff on emergency procedures and emergency contact information. This information will be stored in hard-copies at the location, and kept on file for 12 months after the individuals last attendance. The allergy form may be updated at any given time by an individual or their parent or

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

guardian (if they are a minor).

- Katinnganiq Makerspace Network Digital Platform:

When in the makerspace, an individual will be able to access and use makerspace computers, software, e-learning content, hard-drive storage space (not cloud) and a user forum through a Single-Sign-On security platform – which will require an individual to create an account with a username and password associated to an email address. Individuals may also access the network through a temporary/single use username and password.

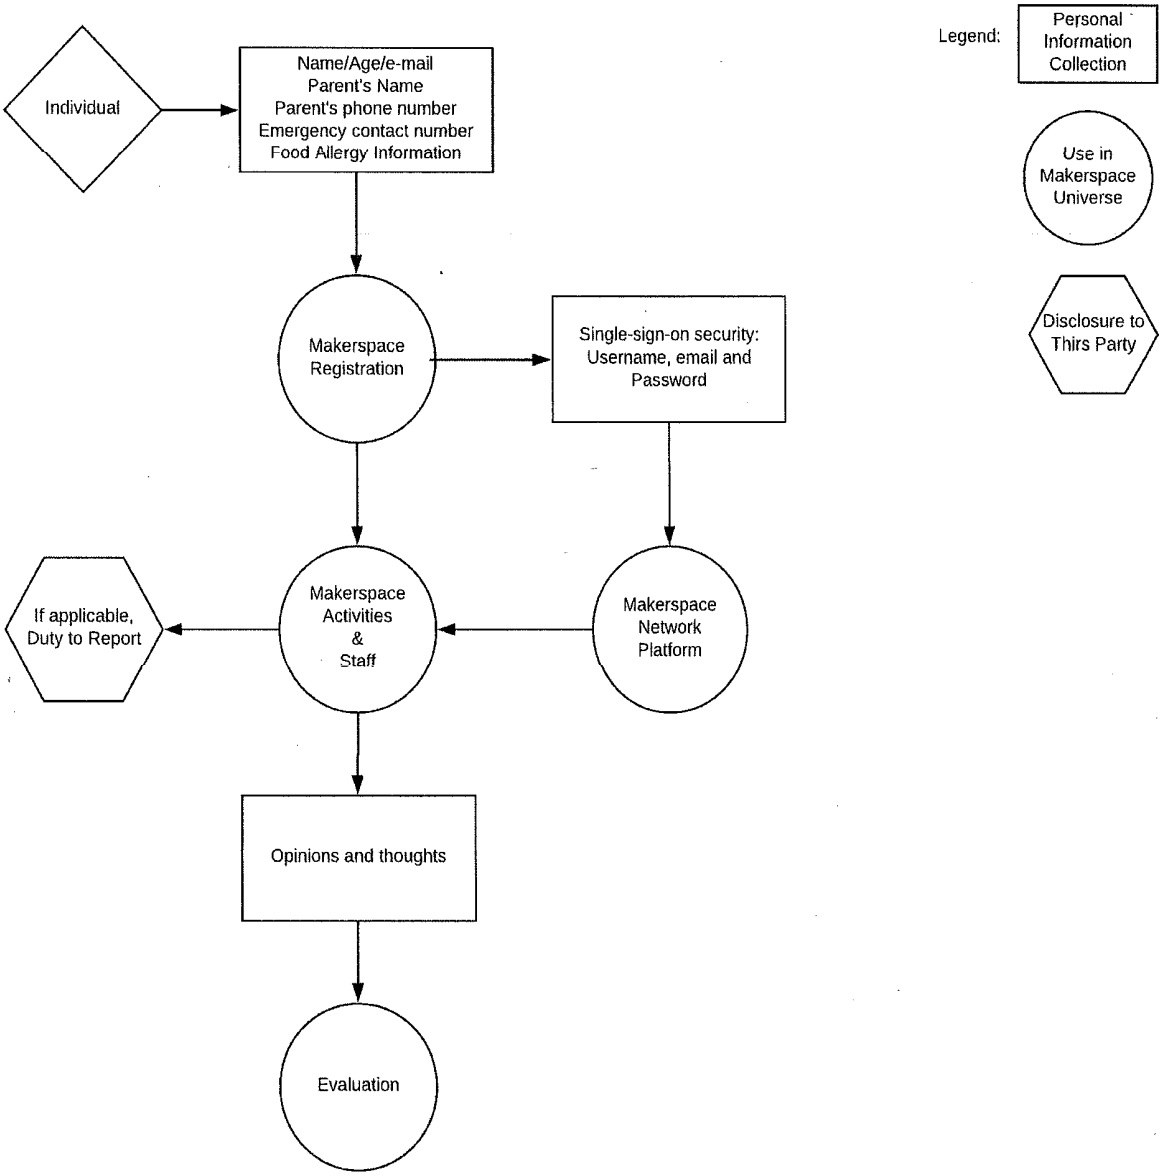
On the user forum, individuals may generate and share personal information (in the form of messages, photos, ideas, opinions, for example) with others on the same network. Individuals will have the right to delete this information at any point in time.

- ASIST Certified Staff and Trauma Informed Practice

At the makerspace, staff will be trained in ASIST (Applied Suicide Intervention Skills Training), and Trauma-informed practice, coordinated by the Embrace Life Council. ASIST is a best practice training developed by LivingWorks which provides people with skills to help prevent the immediate risk of suicide. Trauma Informed Practice is a half-day training designed to increase individual success and well-being in Nunavut. It helps participants understand how to better support individuals who have experienced trauma, whether first-hand, historically, or intergenerationally.

An ASIST certified staff person will act in accordance with their training and continuously disclose that they are ASIST Certified (The makerspace will have ASIST stickers displayed to indicate that one or more staff are ASIST certified). ASIST trained staff will have the capacity to provide guidance and first aid to a person at risk in ways that meet their individual safety and privacy needs. In other words, Staff be trained to spot risky behaviors and mental health experts will be asked to intervene. In no way will Makerspaces staff attempt to provide professional/clinical care.

A staff person will act on their duty to report a child needing protection only to report any indications of immediate risk of self-harm, or suspected cases of child abuse or neglect, as required by the Nunavut's Child and Family Services Act.



- Evaluation:

When conducting evaluation for Makerspaces, individuals will be asked for their written and informed consent to provide, use and disclose their opinions in relation to the KPI's outlined in Chapter 3: Performance Measurement regarding the makerspace and its programs. Anonymous demographic information such as age, race, gender and ethnicity will also be collected if voluntarily provided. Individuals will be asked for this information mostly through surveys, as well as through one on one conversations, sharing circles, interviews. They may choose not to provide any information. If they do, the information they provide will be collected anonymously and with care to be non-identifiable, and will be used for evaluation purposes only, such as informing decision-making and improving programs. Evaluation data will be published in public reports.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

C. Collection, Use and Disclosure of Personal Information

5) **Limiting Collection, Use and Disclosure:** Privacy is a fundamental right of citizens and so any limitation on the privacy of citizens should be carefully analyzed to ensure such limitation is warranted. If your project involves highly sensitive personal information, a broad collection of personal information or a serious impingement on privacy[4] answer the following four questions before proceeding: what questions ?

- Makerspace Registration:

The collection of the personal information identified for registration and participation in makerspace activities is necessary for makerspace staff and instructors to know who, and how old the participants are; to make sure that they have parental or guardian authorization to be there; to know that each individual (and/or their parent/guardian) has read and agreed to the code of conduct and signed the liability form; and because a makerspace might on occasion serve snacks and food, there is a need for staff to be able to take necessary precautions in the event of a food allergy, and have an appropriate emergency action plan and contact information should an allergy/medical emergency occur.

This information will be limited in use - accessed only by Makerspace staff, and not to be disclosed to any third party. We believe that having this information will support makerspace staff to adjust language and activities to suit participants varying age range, and to be able to communicate with them and with parents about programs being offered, schedules, and other related notices. In the case of food allergies, having the knowledge of what foods to avoid as well as what protocols to follow can be life-saving in case of emergencies. The information we collect will be the minimal to provide effective services – though at the moment no less privacy invasive methods have been tried.

- KMN Digital Platform:

Because each makerspace will have a series of shared computers available to the public, it will be necessary to protect user's personal information that is generated through their use. For that reason, we will request each user to set up an account to access the software, resources and user forum that will be available. The account set-up will request an email address, a username, and a password for a single-sign-on (SSO) authentication (like Kerberos) to the KMN Digital Platform – which enables each user to access the platform in a secure and private way – allowing for one's personal use of the resources while providing a storage space for individual work. The SSO use of an email address/username and password will reduce the amount of sign-in's to individual products, therefore reducing the amount of personal information collected as well as the security threat to that information. Therefore, the SSO provides the most amount of security combined with a minimum requirement of personal information. A user account will be deleted after 12 months of inactivity. Storage for each account and computer will be synchronized through a Network Attached Storage Solution (NAS) – which is a system that connects a storage device to a network, allowing storage retrieval of data from a centralized location for authorized network users. Files saved in the local Lab and network attached server will be encrypted while synchronized through cloud services through a RAID management system like Synology.

- ASIST Certified Staff and Trauma Informed Practice

One of the goals of this initiative is to provide a space where users can connect to culturally safe wellness resources. The Trauma-informed practice training, along with the ASIST Training delivered by the Embrace Life Council are important resources for front-line workers to better support Inuit youth. With this training Makerspace staff will have the skills, not to provide counselling, but to provide

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

guidance and mental health first aid to a person at risk in ways that meet their individual safety needs. This measure presents itself as an effective way that feeds into the overall role of Makerspaces in promoting life and improving pathways to mental wellness by connecting to culturally safe wellness resources. There will be no collection and use of personal information recorded by the Makerspace – with conversations occurring only between individuals at a personal level. The only instance in which personal information will be disclosed, is through mutual agreement between Staff and individual as part of a safety plan – or when a staff person sees the need to act on their duty to report a child needing protection in relation to immediate risks of self-harm, or suspected cases of child abuse or neglect, as required by the Nunavut's Child and Family Services Act. In this case, the disclosure of personal information to the relevant authorities is proportional to the need.

- Evaluation:

In terms of evaluation, we will be collecting personal information in the form of thoughts and opinions, as well as personal demographic information of users which are necessary and effective to inform decision making and improve services. This information will be collected anonymously and with care to be non-identifiable. It will be used only by the staff authorized to collect and analyze the information. Evaluation results will be publicly published without any attachment to the individuals (anonymously).

6) **Legal Authority for the Collection, Use and Disclosure of Personal Information:** For each of the collection, use and disclosures identified, evaluate your public body's legal authority and complete the following table

Personal Information Authorities Summary			
7)	**Personal Information Description/Purpose**	**Type**	**Authority**
1.	Name, Age, Name of Parents, Signature, Use of space, liability waiver, allergy forms for Registration	Collection, Use	ATIPP Part 2, Division A: 40-42, Division B 43-46 PIPEDA schedule 1 6.1
2.	Email address, username, password for KMN Digital Platform Access	Collection, Use	ATIPP Part 2, Division A: 40-42, Division B 43-46 PIPEDA schedule 1 6.1
3.	Thoughts and opinions submitted as part of evaluation and/or consultation	Collection	ATIPP Part 2, Division A: 40-42 PIPEDA schedule 1 6.1
4.	Thoughts and opinion processed by Makerspace Org to inform decision making and improved services	Use	ATIPP Part 2, Division B 43-46 PIPEDA schedule 1
5.	Published evaluation results	Disclosure	ATIPP Part 2, Division C 47-49 PIPEDA schedule 1

Compliance with Personal Information International Disclosure Protection Act ("PIIDPA"):
PIIDPA requires that personal information in the custody or control of a public body shall not be stored or accessed outside of Canada, subject to limited exceptions (s.5(1)). Set out here whether or not there will be any proposed storage or access outside of Canada and if so, describe what *PIIDPA* exceptions apply. See **Appendix D** for a summary of the *PIIDPA* exceptions.

Answer: The personal information collected, used, and disclosed as part of this initiative will be stored only within Canada.

D. Correction, Accuracy and Retention of Personal Information

1) How is an individual's information updated or corrected?

An individual may update their personal information for registration personally with Staff at the makerspace or communicated it by email to staff. As per internationally accepted privacy principles and good information management practices, the name and contact information of a staff person will be provided to all individuals at the time of collection, and will be available publicly. Information used for the SSO to access the network can be updated through one's profile at Makerspace computer. For evaluation information that has already been disclosed in published reports or to third parties (previously identified for and consented to) in the 12 months before a request for correction of that information is received – then the KMN will notify the third party of correction, and/or issue a correction/rectification.

2) If information is not updated or corrected (for physical, procedural or other reasons) please explain how it will be annotated?

If one wishes to submit additional evaluation information to update the thoughts and opinions provided, they can contact Makerspace staff to submit additional information.

3) If personal information will be disclosed to others, how will the public body notify them of the update, correction or annotation? (See s. 25 of *FOIPOP* for further information on correction and accuracy obligations).

No information will be disclosed to third parties other than evaluation information which will be published and collected anonymously. Additional evaluation information that is provided will be included as best as possible before publishing, and if after publishing, it will be included in the next annual report.

4) Does your initiative use personal information to make decisions that directly affect an individual? If yes, please explain.

Yes. Our initiative will collect personal information for evaluation in order to make decisions to better improve services for the individuals who use those services and provided their feedback. This will include what kinds of programming are available and how that programming is delivered.

5) Do you have a records retention and/or disposition schedule that will ensure that personal information is kept for at least one year after it is used in making a decision directly affecting an individual?

The personal information collected for evaluation informing decision making will be kept on file in the Makerspace office for at least a year it so that the individual has a reasonable opportunity of obtaining access to it. After that time, and when the use of that personal information is expired or no

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

longer viable, we will proves to delete it securely either by shredding or electronic erasure.

E. Security of Personal Information

1) **Reasonable security: Administrative safeguards** – Describe administrative safeguards (such as policies, training, contract provisions, consent forms etc.).

Administratively, we will develop policies that protect individual's privacy and that comply both with ATIPP, PIPEDA and internationally recognized privacy and information management practices. Staff will be trained with regard to privacy issues and contracts will be in place to limit the collection, use and disclosure of personal information without written and informed consent. The request for consent will be clearly described and articulated in each administrative form that requires the input of personal information – as will be the parameters for the use and disclosure of such information.

2) **Technical Safeguards** – Describe technical safeguards (such as passwords and user ID, authentication, encryption, firewalls and intrusion detection, secure transmission, disaster recovery).

The technical safeguards include the Single-Sign-On authentication for makerspace computers to prevent unauthorized access to individual accounts. We will be using the Kerberos authentication technology, most commonly used by Microsoft Windows and which uses symmetric key cryptography and requires trusted third-party authorization to verify user identities. Additionally, each computer available in a Makerspace will contain anti-virus and firewall software.

3) **Physical Safeguards** – Describe physical safeguards (such as secure access, laptops secured to desk, alarm systems).

The hard copy files and computers containing personal information will be securely stored in a separate room/closet in the Makerspace, which will be restricted to Makerspace staff and will be kept locked during out of office hours. The Makerspace building/room will be locked when not open to the public, and where possible secured with a building alarm system.

4) **Auditing** – Describe auditing capability and strategies (audit logs, records of user activity, proactive and focused audit capacity).

At this point, we anticipate that the Makerspace Manager and IT manager will have the capacity to conduct audits and will be able to view the records of activity for different users in the digital network. Whether or not they will have access to saved user work is yet to be determined.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5) **Access Matrix** Access to personal information must be limited to those employees whose job responsibilities require that they access the personal information. Attach a copy of the user access matrix. A user access matrix will list all of the position types (eg. clerical, manager of investigations, finance director) across one axis and all of the personal information types (or file types or data modules) across the other. The matrix will identify by position which individuals will have access to the identified data.

	Registrant Information	User Data in Digital Network	Evaluation Data	ASIST related information
KMN Executive Director			✓	
Local Makerspace Manager	✓	✓	✓	✓
Makerspace Staff/Instructors	✓	✓	✓	✓
IT Manager	✓	✓		

F. Risk Mitigation

1) Assess the impact on privacy, confidentiality and security of personal information as a result of the new program or service or change and make recommendations for mitigation of privacy risks. See **Appendix F** for examples of risks and mitigation strategies.

Risk Mitigation Table

	Risk	Mitigation Strategy	Likelihood	Impact
1	Authorized user views record for personal reasons	Log all read only and change activity Oath of employment and confidentiality agreements Training	Likelihood increases with more users and more staff	More sensitive data results in higher impact More data exposed by incident results in higher impact

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2	IT Manager fails to report privacy breach to Makerspace body	Define Contractual terms: Require reporting within 24 hours to Makerspace Manager Impose penalties for failure to report and late reporting	Severity of consequences for IT Manager may lower the likelihood	Same considerations as above
3	Users breach privacy of other users	Provide code of conduct training that includes specific policies on privacy and consent Implement adequate administrative, technical, and physical safeguards	Likelihood increases with more users Severity of consequences for users privacy breach may lower the likelihood	Same considerations as above

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

SASKATOON

Office of the
Saskatchewan Information
and Privacy Commissioner

March 20th, 2019

Wenda Atkinson
Access and Privacy Officer
City of Saskatoon
222 3rd Avenue North, Saskatoon, SK S7K 0J5

Dear Ms. Atkinson:

Re: Preliminary Privacy Impact Assessment - ConnectYXE Program

This letter is in response to the Preliminary Privacy Impact Assessment (PPIA) for the Connect YXE Program, which was received by our office on February 15, 2019. An amended version of the PPIA was later received on February 27, 2019, following a telephone conversation between our office and the City of Saskatoon (City). The PPIA forms part of the City's final proposal for their participation in the Government of Canada's Smart Cities Challenge.

BACKGROUND

In November 2017, the Government of Canada launched the Smart Cities Challenge (Challenge) which challenged communities across Canada to develop projects to improve the lives of citizens using data and connected technology. The Government of Canada received and assessed over 200 applications and of those, twenty finalists were chosen including the City of Saskatoon. The Challenge offers finalists an opportunity to win prize money in the amount $5 million, $ 10 million or $ 50 million dollars to develop and implement their proposed projects. The City is competing in the $ 10 million dollar prize category.

In April 2018, Canada's federal, provincial and territorial privacy protection authorities, including our office, wrote to the Minister of Infrastructure and Communities to urge the Government of Canada to take proactive steps to ensure that privacy and security of personal information are considered in the selection, design and implementation of the winning proposals.

In this regard, in August 2018, Infrastructure Canada issued a finalist guide requiring all finalists to engage with the privacy protection authority in their jurisdiction and to submit a final proposal that contains, among other elements, a chapter on data and privacy. The guide also requires that the final proposal include a PPIA that would also be provided to the privacy protection authority in their jurisdiction, if the proposed project will involve personal information. If the project will not involve personal information, a

/2

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Preliminary Rationale Analysis would be required instead. The purpose of the Preliminary Rationale Analysis is to document how the finalist determined that personal information would not be involved in their project.

Our office wrote to the City on June 12, 2018 to congratulate the City on becoming a finalist and encouraged the City to consult with our office to provide details regarding the City's proposed project. Telephone calls between our offices took place on February 11, 2019 and February 25, 2019 to discuss the City's project in general terms and to clarify our office's expectation regarding the PPIA to be submitted. On February 15, 2019 and February 27, 2019, our office received copies of the City's:

- Finalist proposal
- ConnectYXE PPIA
- Digital Information Technology Security Policy
- Privacy and Confidentiality Policy
- Data Management Plan
- Privacy Breach Protocol

As stated in the finalist proposal, ConnectYXE will combine technology to connect indigenous youth, and their families and supporters, with existing service provider organizations in Saskatoon, to reduce indigenous youth incarceration. At a basic level, ConnectYXE has two components: the front-end which offers various methods for users to interact with ConnectYXE, and the back-end which involves creating a large repository of data to provide content to ConnectYXE and which serves to identify trends, generate reports and evaluate services. ConnectYXE involves many third party service organizations in Saskatoon and a third party service provider who will provide and manage the technology for the back-end component of the program.

We would like to commend the City of Saskatoon for taking on such an important social issue and for the time and effort the City has devoted thus far to developing its innovative solution. Our comments below are focused primarily on the contents of the finalist proposal and the ConnectYXE PPIA. Given that the ConnectYXE program is in the early stages of development, with most of its components at the conceptual stage, our comments are high level and serve to identify potential areas that may need to be further examined via a Privacy Impact Assessment.

COMMENTS ON FINAL PROPOSAL AND PPIA

Does the ConnectYXE program involve personal information, or personal health information?

Based on the contents of the finalist proposal and the PPIA, it is unclear whether the City has appropriately assessed whether personal information or personal health information, is ,or will be, involved. The finalist proposal describes various components of the overall program that could collect personal information. For instance, on page 18 to 21, the proposal states that the front-end component of ConnectYXE will allow a user to interact with ConnectYXE using various methods such as: a smartphone app, a mobile device, a public or personal computer, a public touch screen (kiosk), telephone, chat and Facebook. The proposal does not elaborate on whether any personal information may be collected from users via these various

/3

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

methods, especially via social media, nor discuss how ConnectYXE will prevent certain personal information from being collected in the first place, if that is the goal.

Devices connected to the internet, with or without Wi-Fi, have the ability to connect and communicate a wide range of online and offline information that may include location, browsing history, IP addresses, device unique identifiers, media access control (MAC) address, among other information. Furthermore, mobile apps, if not developed in a privacy conscious way, may collect or have access to personal information stored on a user's mobile phone. Federal, provincial and territorial privacy protection authorities in Canada, and elsewhere, have already issued various investigation reports and guidance documents related to these issues, which we would encourage the City to consult should they win in their category and continue developing the ConnectYXE program.

In regards to the ability of users to interact with ConnectYXE by calling in to the system, or using a chat feature, it is unclear if there will be transcripts produced from these calls and chats and if these transcripts will be retained, even for a short period of time. Users who call and use the chat feature may inadvertently provide personal information, even if it is not requested. In these circumstances, the City cannot fully control what information a user provides.

Furthermore, the illustration use case provided on page 5 of the proposal states that if a youth connects to ConnectYXE and accepts an offer to receive a free transit pass to get to a shelter, ConnectYXE would need to communicate with the youth's phone to provide that free pass. The use case does not provide details of the personal information needed to provide the free pass as a token to a user's phone. Presumably, this would require the youth to provide identifying information such as their mobile phone number so they can receive the pass via text, or an email address to complete the transaction. Our office sees value in offering various communication methods to users of ConnectYXE but these methods should be developed and implemented with appropriate measures to protect personal information.

Additionally, page 6 of the final proposal indicates that measuring outcomes related to the use of ConnectYXE will involve outputs such as the number of users and repeat users. Collecting data about the number of users could involve collecting aggregate data; however, it is unclear how the City would know who is a repeat user without the ability to identify specific users and to know when they have interacted with ConnectYXE more than once. Such information could be personal information.

An earlier version of the final proposal provided to our office indicated that a future iteration of the ConnectYXE would allow users to authenticate to ConnectYXE and maintain a personal profile within the system. It is unclear why this information was removed from the subsequent version of the proposal provided to our office – whether because these features will no longer be offered at all, or if such features were considered to be too far into the future to be included in the proposal for the Smart Cities Challenge. If there are future plans for ConnectYXE to allow users to create profiles and be authenticated, our office would not be opposed to these features. However, our office would expect these features to comply with privacy legislation in the province and to have built-in privacy protections. Additionally, our office would expect the City to undertake appropriate security and privacy assessments to identify and mitigate any potential risks.

Based on the contents of the proposal, as it relates to users interacting with ConnectYXE, it is unclear how the City arrived at the conclusion in the PPIA that the ConnectYXE program will not require users to

/4

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

authenticate nor to provide personal information. As stated previously, although many components of the ConnectYXE are at the conceptual stage, our office expected that the City would map out the information flows for the various communication methods that will be offered to users, and to list all the information that may be collected, shared, used and retained for each method. This would provide an opportunity to identify potential collections of personal information, or personal health information, and to identify areas to be assessed later via a PIA. Our office communicated this expectation to the City on February 7, 2019 via email correspondence and also highlighted the importance of considering context in making the determination about whether or not personal information could be collected.

In regards to the back-end component of the ConnectYXE, the final proposal states that all partners, including community based organization, will transfer data to a large data repository managed by a third party service provider, ISM Canada. The concept for this large repository is based on the design of the Saskatchewan Social Innovation Hub (SSIH), also managed by ISM Canada. The proposal states that ConnectYXE will leverage the security and privacy elements of that design but does not provide details of those security or privacy elements. It is unclear whether the City has assessed, or intends to assess, those existing privacy and security elements to determine if they are appropriate for the ConnectYXE program, in line with current privacy legislation and whether any compensating privacy and security controls will be needed. There is also no indication in the PPIA whether any work has already been undertaken in this regard.

Additionally, the proposal states that all partners who will provide their data to the ConnectYXE program will complete a detailed assessment of their technological maturity and their data. This will allow them to identify whether their data contains any personal information or personal health information so that a PIA can be completed. At this stage, the processes by which any personal information or personal health information will be removed from the data will be identified. Elsewhere in the proposal, on page 59, it states that IT operations will monitor for data and privacy breaches by routinely examining data submitted from partners to identify personal data that may have been inadvertently transmitted to ConnectYXE. Based on this information, even after partners have completed PIAs and their data has been de-identified, there is still a risk that the ConnectYXE program will contain personal information. Again, it is unclear how the City concluded in the PPIA that the ConnectYXE program would not involve any personal information, or personal health information, based on the contents of the proposal.

The last statement in the PPIA states that ConnectYXE will conduct an extensive PIA should the City be a successful winner. It is unclear what the scope of such a PIA would be and why the City has stated it would be required at this stage – given the conclusions in the PPIA. Our office agrees that a more comprehensive PIA, that more accurately describes the personal information to be involved in the ConnectYXE program would be needed should the City be a successful winner. This PIA would need to elaborate on the points of data collection, processing and access and ensure that security assessments and risks are incorporated into the overall assessment of potential privacy risks and compliance with privacy legislation. Furthermore, the comprehensive PIA to be completed by the City should also incorporate the PIAs to be completed by its partners and include an assessment of ISM Canada's role in the program, which at present, is lacking in detail in the proposal and the PPIA

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Legislative Authority

The proposal and the PPIA do not currently state the legislative authority for the ConnectYXE program as proposed, though the City did provide this information to our office via email correspondence on March 1, 2019. The City indicated that *The Cities Act* provides the authority for the project. Should the City be selected a winner, our office expects that documents related to the ConnectYXE program will identify all applicable privacy legislation and identify the regulatory and legal framework for the project. For example, we would expect a PIA related to the ConnectYXE program to clearly identify the sections of *The Cities Act* and any other applicable law(s) or policy(ies), authorizing the City to collect information from indigenous youth and their families. In addition, the PIA should clearly list all the data elements that would be collected, explain the purpose for the collection of each data element and refer to the specific section of the legislation or regulation that permits the collection of each data element.

if personal data is collected

Providing this level of detail would allow the City to comply with applicable legal and policy requirements and ensure only the minimum amount of personal information is collected. It would also allow the City to demonstrate how it meets the legal requirements of PART IV Protection of Privacy of *The Local Authority Freedom of Information and Protection of Privacy Act* (LA FOIP), which requires that personal information is only collected, used and disclosed for a purpose that relates to an existing or proposed program or activity.

Integrating security and privacy assessments to appropriately identify and mitigate risks

As stated in the joint letter to the Minister of Infrastructure and Communities, effective safeguards are especially complex to implement in the smart cities context given the divers forms of technology deployed. For this reason, it is critical that a there be appropriate security assessments undertaken, that complement privacy assessments. The ConnectYXE depends on various technologies and yet the information provided in the proposal and the PPIA related to these technologies was quite limited. There were no copies of existing technical documents, or details of when and how security assessments will be undertaken later. As mentioned in the preceding section of this letter, the ConnectYXE program will be based on the design of the SSIH, which according to the proposal has been audited and approved by the IT Division of the Government of Saskatchewan. The findings and recommendations from those audits were not included in the proposal or the PPIA.

According to the proposal, the ConnectYXE program will also leverage other existing services like the Homeless Individual and Families Information System (HIFIS). HIFIS data are available to the ConnectYXE by an application layer interface that has already been developed though the proposal and the PPIA do not elaborate on the security assessments that may have also already been undertaken in this regard.

PPIA assessment missing our partners

Furthermore, the use of Microsoft's cloud solutions to host the environment required for ConnectYXE is involved though again, there are no technical details regarding the use of cloud storage. All connections to systems must be considered in the overall assessment of security and privacy risks and detailed in future security and privacy assessments. Should the City be a winner in the Smart Cities Challenge, we recommend that a future PIA to be developed contain more emphasis on the complex safeguards that will be incorporated into the ConnectYXE program and that the PIA contain evidence in the form of copies of security assessments and other documents to demonstrate the selection and implementation of safeguards.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Given the complexity of the ConnectYXE program and the various technological components involved, it may be more efficient to have a more modular approach for assessing privacy risks by completing one overarching PIA with multiple, more narrowly scoped PIAs to assess individual components. The proposal identifies ISM Canada as the "data custodian" in the ConnectYXE program, which implies ISM Canada will be responsible for the security of data. As such, the City should consider how it will work with ISM Canada to ensure ISM Canada is also conducting appropriate PIAs that will form part of the overarching PIA that the City will complete. The City in this case is ultimately accountable for all aspects of the ConnectYXE program. ISM Canada is the Information Management Service Provider and so should be identified as such in the program documentation. We would encourage the City to contact our office for guidance on how to develop a modular PIA approach for the ConnectYXE program, should the City be selected as one of the winners.

Other considerations

The proposal lists a number of main stakeholder groups that will continue to be engaged as part of the ConnectYXE program but does not currently list any stakeholder groups that could provide guidance or expertise related to privacy – whether that is in-house privacy resources or our office. Should the City be selected as a winner, we would expect the City to continue to engage with our office and keep our office informed of developments related to the ConnectYXE program. A plan for how the City will engage with our office should be developed and included in any PIA(s) to be conducted in the future.

Page 17 of the proposal provides details of communications plan to be used to create awareness about the ConnectYXE program and used to educate and train partners involved. These plans do not appear to include a privacy component which would be important to ensure full transparency of the information practices that will effect users of the ConnectYXE program. The implementation of free WiFi in targeted areas and communities is a component of the program that may raise concerns from individuals living in those communities about the type of information collected and potentially used about their community and the individuals using the free WiFi. Our office recommends that the City ensure communications plans and any outreach with communities include a discussion on privacy.

It is unclear whether the ConnectYXE program would receive information from partners about individuals who follow through with services requested via the program. For instance, taking the use case on page 5 of the proposal, if a user requests shelter and a meal, it is unclear if the organization(s) providing the shelter and meal will report back to the City about whether or not the user actually followed through with the requests. It would seem useful for the City to know whether the ConnectYXE program is having an impact, though it may involve identifying users and reporting back on those users. This is an area that would need to be further elaborated on in any future PIA(s).

CONCLUSION

As indicated in the preceding paragraphs, the proposal contains information to indicate that there is likely personal information, or personal health information, involved in the ConnectYXE program, although the PPIA concludes that no personal information is involved. Having such conflicting views and conclusions in documents related to the same program makes it difficult for our office to make specific comments about the proposed privacy protections or privacy practices.

/7

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Also, since there were few technical details provided at this stage regarding a program that is almost entirely dependent on technologies, it is also difficult for our office to offer more specific comments regarding the potential security and privacy risks related to those technologies.

Should the City be selected as a winner, our office recommends that the City resolve the contradicting information in the ConnectYXE program proposal and PPIA so that a more accurate description and thorough analysis of potential security and privacy risks is included in these documents. We also recommend that the City consider the areas outlined in this letter that may need to be further examined via a more comprehensive PIA. Finally, we would like to request that the City continue to engage with our office on developments related to the ConenctYXE program. Our office is always available to offer guidance on PIAs, assessing security and privacy risks and on the requirements of LA FOIP.

We would like to congratulate the City again for being selected a finalist in the Smart Cities Challenge and for the work it has completed to date on the ConnectYXE program.

Yours truly,

Marjorie Platero
Analyst

11 Appendices

11.1 Appendix One: Preliminary Privacy Impact Assessment

1. General

Name of Department/Division	Strategy and Transformation/Information Technology
Project Lead(s)	Jazz Pabla
Title	ConnectYXE

2. Description of the project including the purpose and objectives:

In response to the Federal Government's (Infrastructure Canada's) Smart Cities Challenge, the City has proposed a program that, should the City be selected as a winner, will execute over the course of the next 5 years. We have branded this program "ConnectYXE".

The mission statement of this program is "To be the city that breaks the cycle of Indigenous youth incarceration by creating a new cycle focused on building purpose, belonging, security and identity."

The technical solution proposed is to establish an independent board (incorporated or not) to provide governance over the engagement with community-based organizations (CBOs) and institutional partners, and to connect the services provided by those partners so that they are available to Indigenous youth, their families and to their "allies" – those who support and help them.

Users of the system – Indigenous youth, their families and allies – will not be required to authenticate, nor to provide personal information about themselves.

what are they considering as personal info?

A dimension of the program is to improve access to the internet in areas of highest concentration of Indigenous youth and families by providing free Wi-Fi in strategically selected neighbourhoods and kiosks in locations where youth "hang out". Access to the free Wi-Fi will not collect IP Addresses. Rather, raw data regarding how many individuals use the free Wi-Fi will be collected.

how can they identify if the same individual used it 2+ times?

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3. What type of information is involved in the project?

All information that will be contained by the ConnectYXE system will be data provided by CBOs and institutional partners. CBOs will remove any PI/PHI prior to disclosing any information to ConnectYXE. This data is encrypted as transmitted and at rest, and will be securely segregated within the ConnectYXE system, accessible only by the CBO who disclosed the data, and by the information management service provider, ISM Canada.

Departments of City of Saskatoon, Saskatoon Transit, and Saskatoon Recreation and Community Development will provide data that is available to the public and does not contain any PI.

As a part of the ConnectYXE program, we will provide free public Wi-Fi to a neighbourhood of Saskatoon. ConnectYXE will ensure appropriate network protocols are in place so that only internet data ("HTTP" or "HTTPS") is transmitted, which will limit access to devices onto the LAN side. DHCP will be set to provide IP addresses with a lease of 8 hours, so that IP addresses will not be associated with a specific LAN. Host names will not be exposed. Free public Wi-Fi may be contracted to an Internet Service Provider such as Shaw or Sasktel; this provider would provide additional network data protection services.

End users will connect to ConnectYXE by phone or by an internet connection. Users will not be required to identify themselves. Depending on the nature of the interaction, the user may be asked to provide their age (not their date of birth), and their gender. If the interaction is such that the individual's location is required, this may be requested. If the interaction results in a requirement to send a transit ticket, the user's phone number may be requested so as to send an electronic ticket. This data will used for the purposes of the transaction. Phone number and information that identifies the device (such as IP address) will not retained; other data will be stored as aggregated data only. This data cannot be used to identify a specific individual, and so is not considered PI.

4. How will the information be used?

The Information Management Service Provider, ISM Data Lab, uses Artificial Intelligence tools that mine the CBO data and extracts services provided by CBOs. Following processing, all source data extracted and analyzed by the Data Lab will be destroyed: only the aggregated results – the list of services available and other data surrounding and supporting these services – will be preserved.

5. Questions:

1 - Does the project involve any type of confidential information? (i.e. personal, sensitive third party or other confidential information)

No. No. CBOs will remove any PI/PHI prior to disclosing any information to ConnectYXE. As CBOs are onboarded,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

the ConnectYXE Council will conduct a pre - privacy impact assessment and a data sharing agreement with each CBO. This assessment will determine if the CBO data contains any PI/PHI. If it does, we will work with the CBO to develop a process whereby that data is removed before transmission.

We will subsequently monitor the data that is submitted to look for any PI/PHI; if found, it will be removed, and treated according to the protocols for a data and privacy breach.

2 - Is this a new program or service?

Yes. ConnectYXE is a proposal for the national Smart Cities Challenge. If it is a successful winner it will be a new service that connects youth, families and allies to additional CBOs.

3 - Are you making significant changes to an existing program or service?

No. This is a new service, that is modelled after the provincial Social Innovation Hub.

4 - If this project relates to an existing project was a full PIA completed? If so what is the project's name?

This does not relate to any existing project of the City of Saskatoon.

5 - Will you be data linking with other information within the City?

Yes. Yes, there will be aggregation of data provided from multiple CBOs and institutional partners. No linked data will contain PI/PHI because ConnectYXE does not have any.

6 - Will the project contract out any function?

Yes. ISM is our technology partner in this program. Upon being awarded the Smart City Challenge, the City of Saskatoon will form a governing body (the ConnectYXE Council) which will enter into an agreement with ISM Canada and will formalize the Information Management Service Provider service agreement.

7 - Will there be a collection of any personal, third party, or other confidential information via web-based technology?

No. If they have any, CBOs will remove PI/PHI prior to disclosing any information to ConnectYXE.

8 - Are you using personal information to determine eligibility for a program or service or for enforcement?

No. ConnectYXE provides a list of services available for end users. No personal information will be used to determine eligibility for a program or service, nor for enforcement.

9 - Will the personal information be shared outside the organization?

No. No PI/PHI from the City of Saskatoon will be disclosed.

10 - Will the personal information be stored outside the organization?

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

No. Data from respective CBO will be stored in ConnectYXE, which "resides" in the Microsoft Azure Cloud. This data is partitioned and not accessible to anyone except the CBO providing the data, and by the ISM Data Lab. ISM is an Information Management Service Provider (IMSP) as defined by LAFOIP. CBOs will disclose only data that does not include PI/PHI into the system.

City of Saskatoon will not disclose any PI to ConnectYXE.

11 - Will the personal information be used for other purposes, including research and statistical purposes?

No. No identifiable PI/PHI will be collected, disclosed or used for any other purpose.

12 - Will the public be likely to have any privacy concerns regarding the project or the service that is being offered by the City?

Yes. During the engagement consultations with Indigenous groups there were expressions of privacy concerns. We will provide communications and notice of the IMSP agreement as evidence the data is not PI or PHI and is encrypted in transit, at rest, that the data are segregated and not accessible by others.

13 - Are you introducing changes to the business systems or infrastructure architecture that:

- **Affects the physical or logical separation of personal information.**

No. CBOs will remove any PI/PHI prior to disclosing any information to ConnectYXE.

- **Changes the security mechanism used to manage and control access to personal information?**

No. The system will introduce a net new system that will store data segregated by CBO, including a security mechanism used to access these data (by the CBO and by the ISM Data lab). CBOs will remove any PI/PHI prior to disclosing any information to ConnectYXE.

14 - Are there any other or additional reason for undertaking a PIA? If yes please explain.

Inasmuch we are importing data from CBOs, the process of onboarding those parties would each entail a PPIA. ConnectYXE will provide solutions regarding how the CBOs will ensure PI/PHI is not disclosed to ConnectYXE.

6. Legislative Authority of ConnectYXE Proposal

Principle:

The City of Saskatoon is a local authority as defined by section 2(f) of The Local Authority Freedom of Information and Protection of Privacy Act (LAFOIP). ConnectYXE will be a program of the City and will, therefore, be subject to the provisions of LAFOIP.

ConnectYXE will not be collecting PI or PHI; therefore, the data that will be disclosed by CBOs or institutional partners

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

will be restricted to data fields that do not include PI/PHI or from which one can infer identifiable PI/PHI. It will be the CBOs that ensure the data fields disclosed to ConnectYXE do not include PI/PHI. ConnectYXE will monitor collected data, looking for incidental PI/PHI. If such incidental disclosure occurs, the City will undertake a privacy breach investigation following the City's Privacy Breach Protocol Guidelines.

ConnectYXE will conduct an extensive privacy impact assessment should they be the successful winner of the Smart Cities Challenge.

Response from the Office of the Saskatchewan Information and Privacy Commissioner

The following response was provided to the City of Saskatoon Data and Privacy Office on Monday, March 4th, indicating the engagement of the team with the OIPC.

..., this email is to confirm that our offices have engaged in telephone calls on February 11 and 25, 2019, and that we receive various documents, including a copy of the City's finalist proposal and PPIA, on February 15 and 27, 2019.

We are currently drafting our response letter to the City which will include comments on the City's final proposal and PPIA. We hope to have this draft sent to you sometime this week. A final version of our letter will be prepared after you have read our draft. The final letter will be provided to you, with a c.c. to Infrastructure Canada before the April 9, 2019 deadline.

If you have any questions or need any information, please do not hesitate to contact me. Thank you,

Marjorie Platero

Part 1: Summary of Program or Activity

Who?

Name of project
The Tri-Council Region Smart Cities Challenge

These are the Entities that have Co-operated in The Tri-Council Region Smart Cities Challenge
Opaskwayak Cree Nation, The Town of The Pas, and The Rural Municipality of Kelsey

Name(s) of project representatives
Rose Neufeld, Derek Neufeld, Glen Ross, Jim Berscheid, and Chad Zolinski

Other entities that may be involved

- Northern Regional Health Authority
- Opaskwayak Vertical Smart Farm
- Tri-Council Not-for-Profit Management Corporation (will be activated if the Challenge is won by the Tri-Council and be responsible for the financial administration as well as overseeing the progress and evaluation of the project)

What?

Summary of the new program, service, software, or change: *Provide an explanation of the new program, service or change and include an explanation of the current state.*

Our project is directed at improving the health of community members through the provision of direct to door food distribution of locally grown food. Fruits and vegetables, produced at the local Vertical Smart Farm, can be ordered via a smart phone application and then delivered to the door via electric cars. Additionally, an evaluation of the impact of eating more fruits and vegetables as it pertains to the health of an individual, specifically biometrics related to diabetes, will be conducted. This will take the form of a volunteer study group with approximately 200 participants.

Currently the OCN Smart Farm has begun growing fruits and vegetables and local people have been enjoying the produce. However, with a diabetes rate of about 50% of the population, we wish to create a link between healthy eating and improved health amongst community members, using this information to create hope and opportunity for individuals to increase their understanding and control of their own health.

Purposes, goals and objectives: *Describe what you are trying to accomplish with the new program, service or change. For example: improving client services, improving efficiencies, improving privacy protection, streamlining processes.*

Our project aims to reduce the rate of diabetes in the community and to reduce the high glucose levels that current diabetics are living with daily. We believe that access to good food and knowledge of the impact of good food on health will change the health and lives of our community members and that

the study will inform and contribute to the knowledge base of our communities as well as those of all Canadians.

We also aim to reduce the amount of food imported to the community. Currently the imported food is expensive and of generally poorer quality which is related to the transport time required to get the food to our northern location. The cost and the quality are impacting health because of the ensuing reduced use by our community members.

Describe the type of application: *Identify and describe the types of applications, platforms and external entities involved in the information flow (collection, use and disclosure).*

Health care professionals working at the Health Canada accredited health clinics will have access to study participant health information via the electronic medical record (EMR) which will be utilized to enrol and follow the study participants. The EMR utilized in the region is Accuro, which is one of the EMRS approved for use by Manitoba eHealth.

All health care data is protected by the PHIA legislation that governs personal health information.

Two health clinics will be utilized for the purpose of working with and supporting individuals who wish to be participants in the study group. One health clinic, Beatrice Wilson Health Centre, is operated by Opaskwayak Health Authority. The other clinic, The Pas Primary Care Clinic, is located within The Pas Health Complex in The Town of The Pas and is operated by the provincial Northern Regional Health Region. Both clinics follow the PHIA legislation and all staff have received PHIA training and have signed agreements of confidentiality under this legislation. All patient data is stored on an electronic medical record, Accuro, and the data is shared between the two sites. **The Northern Regional Health Authority is the trustee of this data.** Opaskwayak Health Authority has signed a Privacy Impact Agreement with the Northern Regional Health Authority (NRHA) which includes a Privacy Impact Assessment compliance document that was jointly signed at the time that Accuro was first shared by the NRHA with Opaskwayak Health Authority. Each of the clinics has a privacy officer, responsible for maintaining confidentiality, auditing, and to whom individuals may go to regarding concerns or any real or perceived breaches of their confidentiality that they wish to discuss.

Why?

Explain why you are implementing the new program, service or change, and describe the benefits.

This new program is being implemented because currently, and historically, access to healthy food is very difficult for our community, located in northern Manitoba. The distance that food must travel to reach our community results in high costs, low quality and early spoilage rates. This makes it difficult for many of our community members to purchase fresh food to feed their families. This has resulted in many families including little or no fruits and vegetables in their daily diet. The program we are implementing will assist in making food available and the study we are proposing will create a base of knowledge and a core group of individuals that become aware of the link between physical biometrics such as blood glucose levels and consumed foods. Our goal is to reduce the rates of diabetes and provide our community members with options to attend to their health through accessibility to healthy foods.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

We are utilizing technology to help us address the problem of adequate food supply knowing that new and innovative measures are required as the current means of acquiring healthy food is not addressing the increasing poor health statistics in our community.

Where?

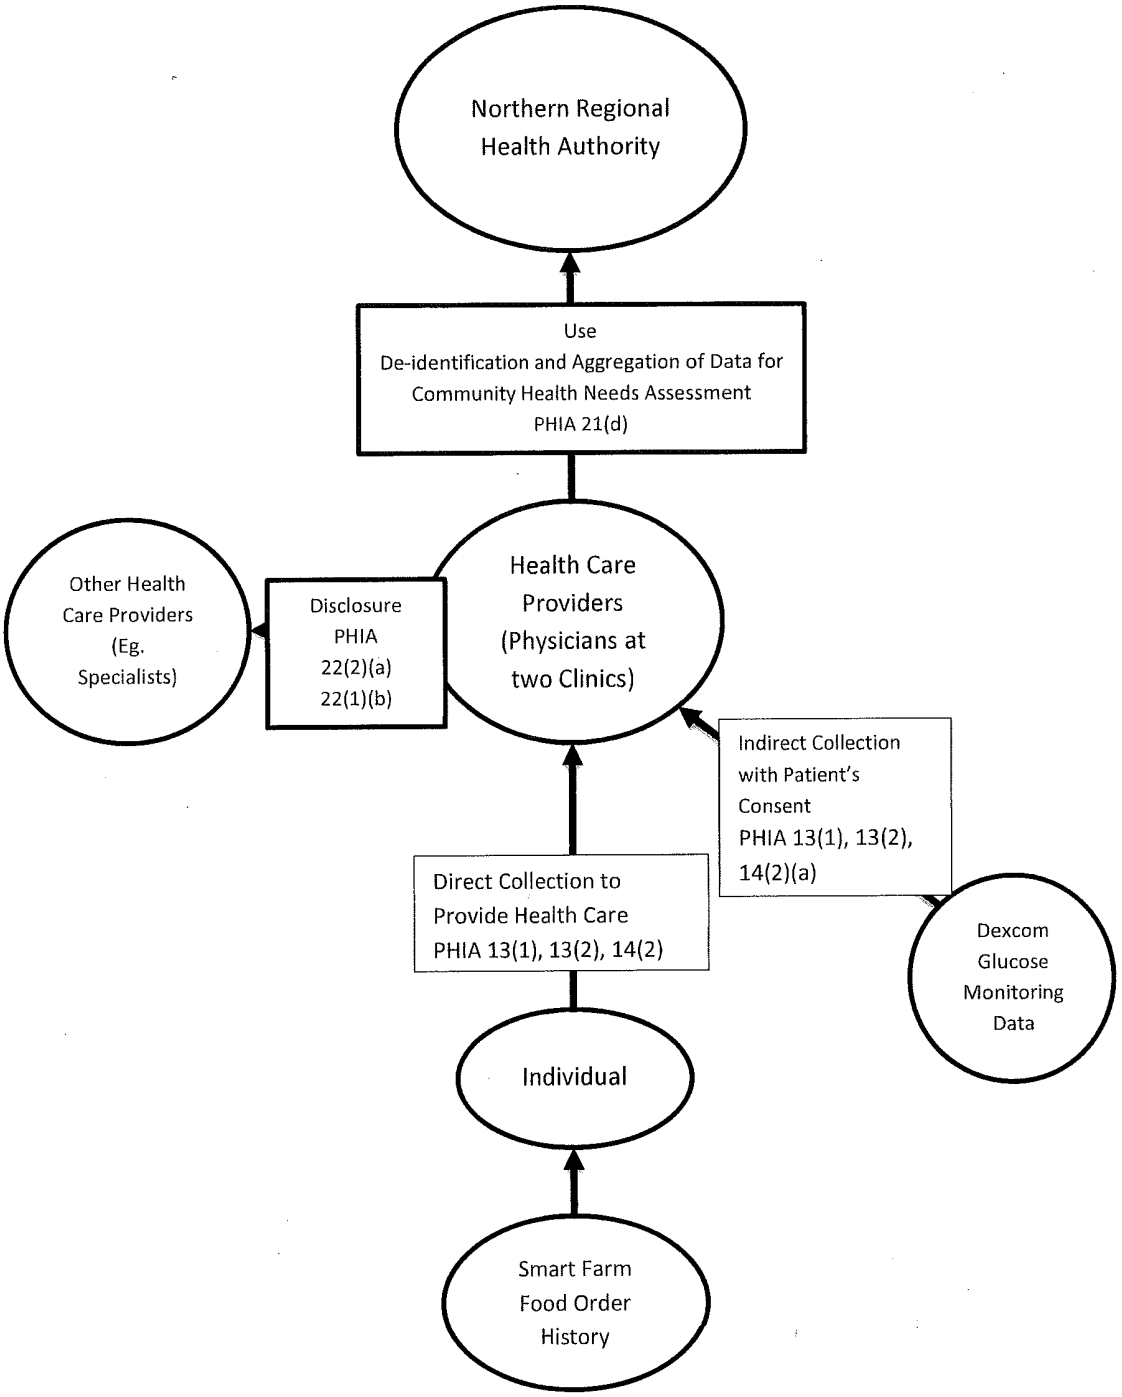
Where is the data flow taking place? Is it online, in person, paper-based, in Manitoba, in Canada or the United States?

This project is taking place in Manitoba, Canada. All servers will be in Canada and communication will take place through locally available wireless communication infrastructures. The wearable device from Dexcom has been approved by the federal government for use in Canada. The web-based Dexcom CLARITY® is a data management software application that allows the transfer of glucose data to remote servers for data management. They are a U.S. company, and they store all their data in Germany as this is the country which currently has the highest data security safeguards in the world.

When?

Outline any key dates such as project deadlines, key milestones, implementation timeframes, contract parameters, etc.

Our project will begin in the fall of 2019 or early 2020 depending on when funds become available as a result of our community successfully winning the Smart Cities Challenge; an innovative initiative of Infrastructure Canada. Should we not be successful, this may be initiated later as we will continue to work towards funding opportunities to support this project as it is vital to the health of our community members and access to healthy food is critical for our well being.



The first phase of the project will be development of required software and construction of the Plant Factory. This phase is anticipated to take roughly 9-12 months. The second phase of this project will seek community feedback as several different food products are grown and the customer base increases. Baseline health data from the study group will be collected prior to completion of the Plant Factory in order to gather biometric data prior to the introduction of Plant Factory products. This phase of the project will take approximately another 6-12 months. The third phase of the project is anticipated to see broad community consumption of Plant Factory products though the smartphone application along with a general decrease in community diabetes.

Part 2: Describe the Scope

1. **Describe the flow of personal (health) information** *Provide a description of how the information will flow within the organization, including any disclosures (information provided outside the organization). This section should include a brief description (written or visual) showing the flow of personal (health) information through the system from collection to use within the organization, and disclosures (sharing) outside the organization (if applicable).*

This information flow map outlines the collection, use and disclosure of personal or personal health information, with the corresponding legal authority for each information flow.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2. **Who manages, accesses and uses the system?** *Describe who manages the system. Outline who are the intended users of the system within the organization and their connection(s) to the new program, service or change.*

The study participant group will become patients of the health clinic and all information related to their personal health information will be monitored under the privacy legislations applicable there.

3. **Are there any linkages to other systems?** *Explain any linkages to other programs or services. Example: Will data be collected from other systems and/or will data be shared with other systems? Provide timelines and explanation if future linkages are planned but won't be implemented immediately.*

Every 5 years, the province government and Opaskwayak Cree Nation undertake a community health needs assessment which includes aggregated and anonymized data that provides information to health leadership and planners regarding necessary programs and services required by the population. Given that the study group information will be included in the Accuro data, this data will be included in this higher-level assessment, although it will not be identified that these individuals were part of a study group. Rather, their information will be general to all patient data stored in Accuro.

The next data collection for the community health assessment to be completed by the NRHA is in 2019. Data for most individuals living in the Town of The Pas and the RM of Kelsey are collected under the NRHA assessment. The next data collection of this nature for Opaskwayak Cree Nation, under the direction of the Opaskwayak Health Authority is in 2022, as OCN recently completed theirs.

4. **Do you anticipate any potential future enhancements to the system?** *Will the system expand to include more users? Is a series of upgrades part of the contract for a new service or system?*

This is a five-year plan and we do not currently foresee any changes to the plan. We anticipate, as a positive result of the project, that a larger number of people will become interested in attending to their health and following their biometrics. They will be followed at the clinic as any member of the general population can do.

5. **Are there any potential future uses of information?** *Are there any planned secondary uses for the personal (health) information in the system such as research or analysis? A secondary use of the information is any use that is different from the reason the information was collected in the first place.*

The research generated from the study participant group will be utilized for publishing purposes as we hope that this may be of value to Canadians as we seek to address the diabetes epidemic that is facing many Canadian citizens and their families. In this case, all information will be anonymized or excluded if there is any chance that an individual could be identified. We are partnering with the University of Manitoba and one of their researchers who is currently completing a study on nutrition in prenatal women and is thus familiar with the region and the population. By hiring a PhD prepared researcher, affiliated with the University, we will ensure that all research is done under the ethics and standards set by this institution.

Part 3: Collection, use and disclosure of personal (health) information

1. Categories of personal (health) information to be collected, used and/or disclosed

i. Describe the personal (health) information that will be collected and briefly explain the intended use and the potential disclosures of the information.

Information to be collected by the primary care clinics includes name, address, contact information, age, sex, allergies, medications, marital status, medical history, current health status, and all other information as per current best practice in health care delivery. Additionally, the patient will provide

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

data from their smart phone that has captured information from their wearable device and their ordering history and food consumption from the smart farm. The study participants will have certain biometrics measured. However, any person in the community can have this same care without being participants in the study group. The intended use of the study is to demonstrate the connection between food that is consumed and diabetes. It is our intention to respond to the growing diabetes epidemic in our community by demonstrating, using data, that we can impact our health in a positive way and then share our learnings with the nation.

ii. **Describe decisions and approval processes regarding collection, use and disclosure decisions**
Briefly describe the decision-making and approval process that governs the collection, use and disclosure of personal (health) information in the system. For example, how is management involved in the decision-making process?

Personal health information is collected and used for the individual's health as per PHIA and best practice standards of the nursing and medical professionals and their code of conduct within the primary care clinics.

2. Authority for the collection, use and disclosure of personal (health) information *Indicate the specific provision of the law, regulation or authorizing policy that allows you to collect, use and disclose personal (health) information. Such laws and regulations could include FIPPA, PHIA or the governing legislation for the organization.*

For participation in the study group, customers will become patients of one of two clinics and their information will be kept secure through PHIA and the information sharing agreement for the electronic medical record (EMR). The researcher will have everyone in the study group sign a consent form which includes risk, benefits, all data collected and storage of data.

Data collected from the continuous glucose monitoring device, manufactured by Dexcom, will be sharable with the healthcare provider through Dexcom's proprietary Clarity software. Dexcom provides secure, cloud based, storage of user data using AES-256 encryption and data transmission encryption using a minimum of TLS 1.1. Dexcom operates under the U.S. Health Insurance Portability and Accountability Act (HIPPA) of 1996. Further information about the data security management of Dexcom Clarity software is attached.

PHIA defines **"personal health information"** as recorded information about an identifiable individual that relates to

(a) the individual's health, or health care history, including genetic information about the individual,

(b) the provision of health care to the individual, or

(c) payment for health care provided to the individual, and includes

(d) the PHIN and any other identifying number, symbol or particular assigned to an individual, and

(e) any identifying information about the individual that is collected in the course of, and is incidental to, the provision of health care or payment for health care;

The project will involve personal health information (PHI), including:

- demographic information
- health information related to the provision of health care to the individual
- biometric data from diabetes glucose monitoring device
- order history of food from the smart farm

Trustee

Under PHIA **"trustee"** means a health professional, health care facility, public body, or health services agency that collects or maintains personal health information.

The Northern Health Region is identified as the trustee for the purposes of this project. The personal health information will be collected by physicians (health professional) at medical clinics (health care facility). The Pas Primary Care Clinic (health care facility) and the Northern Health Region (public body) are both trustees. The Pas Primary Care Clinic is operated by the Northern Health Region, and the Region would also be considered the "trustee" of the PHI collected at the Clinic as the Region would "maintain" the PHI. The physicians at Beatrice Wilson Health Centre, OCN (operated by the Opaskwayak Health Authority) are contracted by the Northern Health Region and may be considered employees of the Region:

Please indicate the authorization for:

Collection

Personal health information to be collected includes information about an individual's health status and diabetes management and information about their food order history and glucose monitoring information relating to management of diabetes. Collection of personal health information will be for the purpose of providing health care to the individuals. The following provisions of PHIA provide authority for the collection of personal health information in these circumstances:

> **Restrictions on collection**
> **13(1)** A trustee shall not collect personal health information about an individual unless
> (a) the information is collected for a lawful purpose connected with a function or activity of the trustee; and
> (b) the collection of the information is necessary for that purpose.
>
> **Limit on amount of information collected**
> **13(2)** A trustee shall collect only as much personal health information about an individual as is reasonably necessary to accomplish the purpose for which it is collected.

Use

Use of the personal health information by health care providers at the clinics will be for the purpose of providing health care to the individual including to monitor and manage the health and diabetes of the individual, which is the purpose for which it was collected (s. 21 of PHIA). Anonymized and aggregated

health information will be used by the Northern Health Region to conduct its community health needs assessment (project participants' health information will be included with all community members' health information) (s. 21(d) of PHIA). The following provision of PHIA provides authority for the use of PHI in these circumstances:

> **Restrictions on use of information**
>
> **21** A trustee may use personal health information only for the purpose for which it was collected or received, and shall not use it for any other purpose, unless
>
> (a) the other purpose is directly related to the purpose for which the personal health information was collected or received;
>
> (d) the trustee is a public body or a health care facility and the personal health information is used
>
> (i) to deliver, monitor or evaluate a program that relates to the provision of health care or payment for health care by the trustee, or
>
> (ii) for research and planning that relates to the provision of health care or payment for health care by the trustee;

> **Limit on amount of information used or disclosed**
>
> **20(2)** Every use and disclosure by a trustee of personal health information must be limited to the minimum amount of information necessary to accomplish the purpose for which it is used or disclosed.

Disclosure

Disclosure of the personal health information would be authorized for the following purposes:

- Disclosure for a health care purpose to a person who is or will be providing or has provided health care to the individual (s. 22(2)(a) of PHIA)
- Disclosure with the consent of the individual (s. 22(1)(b) of PHIA)
- Disclosure to a researcher at University of Manitoba to conduct research with de-identified health information (s. 22(2)(f) and 24 of PHIA)

The disclosure of personal health information in the circumstances as noted above is authorized under the following provisions of PHIA:

> **Individual's consent to disclosure**
>
> **22(1)** Except as permitted by subsection (2), a trustee may disclose personal health information only if
>
> (b) the individual the information is about has consented to the disclosure.

> **Disclosure without individual's consent**
>
> **22(2)** A trustee may disclose personal health information without the consent of the individual the information is about if the disclosure is
>
> (a) to a person who is or will be providing or has provided health care to the individual, to the extent necessary to provide health care to the individual, unless the individual has instructed the trustee not to make the disclosure;

(f) in accordance with subsection 22(2.2) (disclosure to another government), section 23 (disclosure to patient's family), section 23.1 (disclosure to religious organization), section 23.2 (disclosure for fundraising), section 24 or 24.1 (disclosure for health research) or section 25 (disclosure to an information manager);

Disclosure for health research

24(1) A trustee may disclose personal health information to a person conducting health research if the research has been approved under this section.

Who may give an approval?

24(2) An approval may be given by

(a) the health information privacy committee established under section 59, if the personal health information is maintained by the government or a government agency; and

(b) an institutional research review committee, if the personal health information is maintained by a trustee other than the government or a government agency.

Conditions for approval

24(3) An approval may be given under this section only if the health information privacy committee or the institutional research review committee, as the case may be, has determined that

(a) the research is of sufficient importance to outweigh the intrusion into privacy that would result from the disclosure of personal health information;

(b) the research purpose cannot reasonably be accomplished unless the personal health information is provided in a form that identifies or may identify individuals;

(c) it is unreasonable or impractical for the person proposing the research to obtain consent from the individuals the personal health information is about; and

(d) the research proposal contains

(i) reasonable safeguards to protect the confidentiality and security of the personal health information, and

(ii) procedures to destroy or remove, at the earliest opportunity consistent with the purposes of the research, any information that, either by itself or when combined with other information available to the holder, allows individuals to be readily identified.

Agreement required

24(4) An approval under this section is conditional on the person proposing the research project entering into an agreement with the trustee, in accordance with the regulations, in which the person agrees

(a) not to publish the personal health information requested in a form that could reasonably be expected to identify the individuals concerned;

(b) to use the personal health information requested solely for the purposes of the approved research project; and

(c) to ensure that the research project complies with the safeguards and procedures described in clause (3)(d).

3. **Source and accuracy of personal (health) information** *Briefly describe who is providing the personal (health) information to your program. For example, is it the individual or another source such as a government department or a family member? How do you ensure that the information received is accurate? How do you ensure the information remains accurate and can be updated?*

PHIA states:

Source of information

14(1) Whenever possible, a trustee shall collect personal health information directly from the individual the information is about.

Exceptions

14(2) Subsection (1) does not apply if

(a) the individual has authorized another method of collection;

For the purposes of our project, personal health information is obtained directly from the individual and not from a family member or another RHA or government department. Patients will provide their food order history data and their glucose monitoring information gathered by their wearable device that is stored on their smart phone to their health care provider (if glucose monitoring data is not collected directly from the patient, the collection from another source (Dexcom) may be authorized by the patient (s.14(2)(a) of PHIA).

4. **Notification statements** *Please provide a sample of your privacy notification statement(s) used to inform individuals about the collection, use and disclosure of their personal (health) information, your legal authority, and contact information for questions. Indicate if you think any changes need to be made or the statements updated.*

Notice of collection is required under s. 15(1) and (2) of PHIA:

Notice of collection practices

15(1) A trustee who collects personal health information directly from the individual the information is about shall, before it is collected or as soon as practicable afterwards, take reasonable steps to inform the individual

(a) of the purpose for which the information is being collected; and

(b) if the trustee is not a health professional, how to contact an officer or employee of the trustee who can answer the individual's questions about the collection.

Exception if information already provided

15(2) A trustee need not comply with subsection (1) if the trustee has recently provided the individual with the information referred to in that subsection about the collection of the same or similar personal health information for the same or a related purpose.

Personal Health Information Disclosure Statement: as per Northern Health Region (trustee):

As part of receiving or providing health care services at a site within the Northern Health Region; we only collect, use and disclose your personal information and personal health information as permitted by The Personal Health Information Act (PHIA) and The Freedom of

Information and Protection of Privacy Act (FIPPA). These Acts require Northern Health Region to protect the privacy of your information.

Part 4: Access rights for individuals

Under PHIA, individuals have a right to:

- request access to and obtain a copy of their personal (health) information held by a public body or trustee, and
- request a correction.

Ability to provide an individual access to their own personal (health) information held in either an electronic or hard copy system *Explain how you will provide individuals with access to their own personal (health) information, including how you will provide copies if requested. Describe how you will correct personal (health) information of an individual if required.*

The health centres have assigned a privacy officer who addresses all requests for information. All requests for information go through the privacy officer except for simple things like a print out of blood work results, an immunization record or other straight forward requests. In this case, the provider simply prints out the requested information and provides the info. It is the responsibility of the patient to communicate any changes related to contact information and personal identifiers that are stored in the clinical record. Broader requests for information are completed by the client who fills out an e-chart form and it is sent to MB e-chart to process. Access policy in the health centre is as follows:

Accessing Personal Health Information Policy

Request During an Appointment

If the client is attending the Health Centre for a healthcare appointment, they may ask the health care provider to show them the information on the screen or to print a copy of specific information **related to the visit** such as an immunization record - if they are there to receive an immunization. If client is requesting to view information not related to the visit, follow the process for eChart Manitoba Request (below).

Accuro Request

All information contained in Accuro is viewable through eChart Manitoba, therefore all requests to view information in Accuro will go through the eChart Manitoba request process.

eChart Manitoba Request

Step 1 – Request is Received
☐ **Client** requests access to personal health information
☐ **Health Care Provider** directs client to the **Privacy Officer**
Step 2 – Complete Request Form
☐ **Privacy Officer** provides **Request to Access Your Personal Health Information in eChart Manitoba** form (attached) & **Request to Access Your Personal Health Information Instructions** form (attached) to client
☐ **Privacy Officer** provides assistance to complete form, if required
☐ **Client** completes & signs form
☐ Completed form is reviewed by the **Privacy Officer** to ensure that it is fully completed & signed
☐ The **Privacy Officer** fulfills the request with 72 hours (3 days) if the information requests relates to health care currently being provided –
☐ If the information request relates to health care currently being provided & the Privacy Officer is not available, **Community Health Nurse 3** will fulfill the information request

Step 3 – Submit Request Form
☐ The **Privacy Officer** submits the form to eChart Manitoba if the information request does not relate to health care currently being provided
Step 4 – Information Request is Filled
☐ **eChart Manitoba** provides requested information directly to client
Step 5 – Explanation
☐ If the client requests an explanation of a medical term, code or abbreviation contained with the health record, assistance will be provided by a) the **original health care provider** or b) **Nurse Manager / Home Care Manager / Mental Health Manager / Community Health Nurse 3**, as appropriate

eChart MANITOBA

REQUEST TO ACCESS YOUR PERSONAL HEALTH INFORMATION IN ECHART MANITOBA

To receive a copy of your personal health information in eChart Manitoba, please:
- Fill in the appropriate fields in the form below and sign at the bottom
- Send the signed and completed form to the address or fax number on the bottom of this form
- OR submit the form directly to your health-care provider

PLEASE PRINT IN CAPITAL LETTERS: A B C 1 2 3

PART 1: ABOUT YOU

SECTION A: Please enter the following information about yourself or the individual for whom you are requesting information.

LAST NAME | FIRST NAME | MIDDLE INITIAL(S)

MAILING ADDRESS

APT / UNIT | STREET NUMBER | STREET NAME | POSTAL CODE

CITY/TOWN | PROVINCE | SEX (CHECK ONE) ☐ FEMALE ☐ MALE

DAYTIME TELEPHONE NUMBER | CELL PHONE NUMBER | BIRTHDATE (DD/MM/YYYY) | PERSONAL HEALTH IDENTIFICATION NUMBER (PHIN) (9-digit number on your Manitoba health card)

SECTION B: If you **do not** have a Manitoba Personal Health Identification Number, please fill in your health card number and issuing jurisdiction below.

HEALTH CARD NUMBER | PROVINCE, TERRITORY OR FEDERAL AUTHORITY

SECTION C: If you are **acting on behalf of another individual**, complete the following section with **your** information. If you are requesting the personal health information of a minor, both parents or guardians may be asked to provide consent. See page two, section C of this form.

LAST NAME | FIRST NAME | DAYTIME TELEPHONE NUMBER

MAILING ADDRESS (IF DIFFERENT FROM ABOVE)

APT / UNIT | STREET NUMBER | STREET NAME | POSTAL CODE

CITY/TOWN | PROVINCE

Why can you request this individual's information? (See page two for details)

PART 2: ABOUT YOUR REQUEST: Please select the type of medical information you are requesting from eChart Manitoba, as well as the dates from which you would like to receive information. EChart Manitoba Services may contact you for more information. **Please note:** You may be required to pay a fee per printed page.

	FROM (DD/MM/YYYY)	TO (DD/MM/YYYY)		FROM (DD/MM/YYYY)	TO (DD/MM/YYYY)
☐ Immunization information			☐ Diagnostic image reports		
☐ Medication history			☐ Encounters from St. Boniface Hospital		
☐ Laboratory information			☐ Visit reasons from St. Boniface Hospital		

NOTES (OPTIONAL)

FOR INTERNAL USE ONLY

DATE RECEIVED | DATE REQUEST EXAMINED

NAME OF RESPONDENT

SIGNATURE OF RESPONDENT

PART 3: SIGNATURE

Please sign and date this completed form and return it to the address or fax number below or directly to your health-care provider.

DATE SIGNED (DD/MM/YYYY)

Part 5: Privacy and Security Measures

The clinics used for this project will comply with the security requirements in PHIA (s. 18 and 19 of PHIA and requirements in the Personal Health Information Regulation under PHIA). These are as follows:

Duty to adopt security safeguards

18(1) In accordance with any requirements of the regulations, a trustee shall protect personal health information by adopting reasonable administrative, technical and physical safeguards that ensure the confidentiality, security, accuracy and integrity of the information.

Specific safeguards

18(2) Without limiting subsection (1), a trustee shall

(a) implement controls that limit the persons who may use personal health information maintained by the trustee to those specifically authorized by the trustee to do so;

(b) implement controls to ensure that personal health information maintained by the trustee cannot be used unless

(i) the identity of the person seeking to use the information is verified as a person the trustee has authorized to use it, and

(ii) the proposed use is verified as being authorized under this Act;

(c) if the trustee uses electronic means to request disclosure of personal health information or to respond to requests for disclosure, implement procedures to prevent the interception of the information by unauthorized persons; and

(d) when responding to requests for disclosure of personal health information, ensure that the request contains sufficient detail to uniquely identify the individual the information is about.

Additional safeguards for information in electronic form

18(3) A trustee who maintains personal health information in electronic form shall implement any additional safeguards for such information required by the regulations.

Safeguards for sensitive information

19 In determining the reasonableness of security safeguards required under section 18, a trustee shall take into account the degree of sensitivity of the personal health information to be protected.

1. Security safeguards

i. Administrative safeguards

All staff working at the Northern Primary Care Clinic or the Beatrice Wilson Health Centre, the two clinics involved in the patient research portion of our project, receive PHIA training at the time of their hiring. They are required to sign a PHIA pledge.

Policies regarding PHIA and the personal health information recorded in the electronic record have been written by the trustee, the Northern Health Region, and are shared by both clinics. These policies guide include:

- Access to personal health information
- Protection of privacy
- Security Safeguards

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Consent
- Restrictions and Use of Disclosure

These policies follow the requirements as outlined in the Personal Health Information Act of Manitoba.

If an individual working at a primary care clinic breaches PHIA, their regulatory bodies will be notified, and those bodies will follow their policies with that professional institution. The clinics will also notify the patient and follow their policies, as mentioned above, in this regard.

ii. Technical safeguards

The electronic medical record is utilized by trained internal staff who have signed the PHIA confidentiality form. Staff are granted access to the record only on an as needed basis. There are various levels of access so that some staff have limited access to information. All individuals utilizing the system have profiles and passwords associated with their access level.

Personal information is used to complete orders within the business unit and deliver orders to the individual's location of choice within the community. This information is stored and accessed in the server data base.

Personal health information in the health clinics is used by health professionals to respond to patients request for care and accessed via the electronic medical record via a password.

Personal health information is shared with other health professionals through referral within the standards of best practice.

iii. System audit functions

The Audit for Security Safeguards policy for the Northern Health Region EMR ensures that as a trustee of personal health information under PHIA, the Northern Health Region shall conduct an audit of security safeguards at least every two (2) years.
Dexcom operates under the U.S. Health Insurance Portability and Accountability Act (HIPPA) of 1996. They provide yearly audits of their information systems security practices.

2. The location of the personal (health) information

Information is held on the Electronic Medical Record server of which the Northern Health Region is the trustee.

3. Will any personal (health) information be stored by organizations outside Manitoba? Canada?

All personal health information is held within the electronic medical record at the health clinics and would only be shared outside of Manitoba if the individual required a referral to medical services that are not available in Manitoba.

Dexcom is a U.S. company that has the Canadian approved technology for continuous glucose monitoring that we will consider using for this project. As mentioned above, Data collected from the continuous glucose monitoring device, manufactured by Dexcom, will be sharable with the healthcare provider through Dexcom's proprietary Clarity software. Dexcom provides secure, cloud based, storage of user data using AES-256 encryption and data transmission encryption using a minimum of

TLS 1.1. Dexcom operates under the U.S. Health Insurance Portability and Accountability Act (HIPPA) of 1996. Further information about the data security management of Dexcom Clarity software can be found in APPENDIX B.

4. Records retention and destruction

The clinics chosen for this project will comply with the requirement to have a retention and destruction policy as required by s. 17(1) of PHIA).

> **Retention and destruction policy**
> **17(1)** A trustee shall establish a written policy concerning the retention and destruction of personal health information and shall comply with that policy.

As per the Northern Regional Health policy, information on the individual's patient health care record on the EMR must be retained for 12 years. This is applicable for both paper and electronic records. Information collected on participants in the study group, for the purpose of research, will be destroyed after the study is completed, unless it is required as part of the permanent record of the patient, such as laboratory results.

5. Information Managers

We do not plan to share information with another party.

Part 6: PIA Summary and Findings

In summary, as advised, we have reviewed the following documents and identified how our project demonstrates awareness of these processes and legislations and how we plan to comply with them.

- **Privacy Impact Assessment Tool**

We have highlighted details of our plan through completion of the Privacy Impact Assessment Tool as written above. We have identified how we plan to mitigate risks to the public as it pertains to the collection and sharing of their personal information as it relates to their interface with our planned project. As such, we have identified the following areas that must be considered:

- Data-minimization – we plan to collect, use and disclose only what is necessary for the customer to receive the goods and services that have identified as something they want and that they provide full consent for all information they share.
- De-identification – we plan to de-identify personal information wherever possible, such as package labelling with a bar and utilizing a scanner rather than having information on the package. Similarly, the health care follow-up and research will be done using the strict codes of ethics and research as established by the Canadian Institute for Health Research and the University of Manitoba, which includes de-identification as much as possible as well as early destruction of information collected when its use has expired. Additionally, this is only done with the individual's full knowledge and consent.
- Opt-out strategy – individuals may opt out of doing business with the smart farm at any time. Options for doing so may be that they opt-out of paying with a credit card and simply use an alternative such as preloading their account with cash at the smart farm. Alternatively, they

may cancel their account with the business at any time. For financial reasons, the business must keep record of any financial transactions for seven years, but any personal information is deleted.

- Data governance and Privacy Management program – our proposed business will be supported by a policy that ensures the administrator of the data required to operate the business of the smart farm and delivery system is aware and compliant with all personal information legislation and the importance of the confidentiality that each customer requires and can be ensured of receiving from the business regarding their information. The administrator will be the privacy lead and will report to the CEO or the business, who in turn reports to the Board of Directors of the business regarding auditing and compliance as well as managing breach of compliance. This will be supported by the policy. There are no other partners to consider as any other entities associated with the business are vendors and accessing their technology will also require agreements and conditions that support current legislation and controls.
- All health care data is protected by the PHIA legislation that governs health data. Two health clinics will be utilized for the purpose of working with and supporting individuals who wish to be participants in the study group. One health clinic, Beatrice Wilson Health Centre, is operated by Opaskwayak Health Authority. The other clinic, The Pas Primary Care Clinic, is located within The Pas Health Complex in The Town of The Pas and is operated by the provincial Northern Regional Health Region. Both clinics follow the PHIA legislation and all staff have received PHIA training and have signed agreements of confidentiality under this legislation. All patient data is stored on an electronic medical record, Accuro, and the data is shared between the two sites. The Northern Regional Health Authority is the trustee of this data. Each of the clinics has a privacy officer, responsible for maintaining confidentiality, auditing, and to whom individuals may go to regarding concerns or any real or perceived breaches of their confidentiality that they wish to discuss.
- Community engagement and project transparency – we have completed comprehensive community engagement strategies including:
  - Surveys – business and general population
  - Forums – special needs groups, business, leadership, health
  - Social media – Facebook
  - Scheduled feedback - groups that hold regular meetings and include Smart Cities on their agenda including governments, business, health, Boards
  - Focus groups – people living with diabetes, disabilities, high risk youth, elders
- Consent – individual consent is built into every step of our proposed project. Consent is necessary to access the server database of our business so that the individual may order and pay for food from the vertical farm and have it delivered to their door. They may also access food by driving to the smart farm and ordering it directly and paying for it in any method they choose, so it is not that this food is inaccessible if they do not provide personal information. Consent is also required if individual's wish to participate in the study or research project associated with our proposal. All information shared by the individual at the health clinic's is covered by PHIA and consent of patients under that legislation.

- **The Personal Health Information Act (PHIA)**

As per Manitoba legislation, PHIA provides access to information and protection of privacy rights concerning personal health information. PHIA allows individuals to examine and receive a copy of their own personal health information from a trustee holding this information. PHIA imposes obligations on trustees for the protection of personal health information, specifically its collection, use, disclosure and security. In our responses above, we have demonstrated that all personal working with individuals in our health centre or performing research in any way that is related to this project, must always have completed PHIA training and signed agreement to maintain patient confidentiality. This applies to all records, information and conversations that have anything to do with personal information of any sort.

- **Fair Information Principles**

The fair information principles, provided by the Manitoba Ombudsman's office and the Office of the Privacy Commissioner of Canada, have been considered in our business plan and will continue to be addressed as we proceed. These principles include:

- Be accountable
- Identify the purpose
- Obtain valid, informed consent
- Limit collection
- Limit use, disclosure and retention
- Be accurate
- Use appropriate safeguards
- Be open
- Give individuals access
- Provide individuals with an avenue for recourse

A detailed risk assessment of the personal information or personal health information of individuals involved in the project will be completed following the success of winning the Challenge and acquiring the funding to do so at that time.

2. Dexcom Clarity Information Security Policy

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Dexcom CLARITY® Information Security Management

The purpose of this document is to provide to potential Users a general description of the security management for the Dexcom CLARITY® software application.

General Description

The web-based Dexcom CLARITY® is a data management software application that allows the transfer of glucose data to remote servers for data management. Dexcom CLARITY® can transfer data from the Dexcom G4® Platinum CGM System and the Dexcom G5™ Mobile CGM System. Healthcare professionals in clinic settings, such as hospitals or medical offices (referred to as "Clinics" in this document), can use the Dexcom CLARITY® clinic portal accessible through the internet. Patients can also use Dexcom CLARITY® on their personal computers. After the glucose data is transferred to Dexcom CLARITY®, the information is processed by Dexcom and transmitted to Dexcom CLARITY® Users and displayed in charts and graphs to help Users analyze trends and patterns in glucose levels.

The computer and network requirements for using Dexcom CLARITY® are listed in the Dexcom CLARITY® User Guide: https://www.dexcom.com/guides.

Deployment Model

The User's personal computer (desktop or laptop) can be used to access Dexcom CLARITY® over the Internet. Dexcom hosts Dexcom CLARITY® on a secure cloud installation, eliminating hosting costs and complexity for the User.

- No peripheral hardware required
- Standard internet access to a specific set of IP addresses
- No interface with clinic medical records is required for a Clinic to operate Dexcom CLARITY®
- Data traffic is secured using TLS 1.1 or higher
- Data encrypted at rest using AES-256 encryption
- Data redundantly backed up across wide geographic separation
- Dexcom is a covered entity providing services to patients using Dexcom CGM systems; no business associate agreement is required for the exchange of patient information between Dexcom and Clinics as covered entities providing health care to the patient

Data Export

Patient data and reports can be exported by the User in PDF or CSV formats.

©2016-2017 Dexcom, Inc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Security Management for Dexcom CLARITY®

The following describes how the Dexcom CLARITY® clinic portal is secured, following the organization of ISO/IEC 27002:2013. The following summarizes security management for the Dexcom CLARITY® system, and does not discuss security for Dexcom CGM Systems.

System Layers

Responsibility for secure operation of Dexcom CLARITY® is shared between **Dexcom** and the **User** and where applicable, the **Clinic**: While Dexcom CLARITY® is designed for secure operation, effective security requires User and Clinic participation.

Security responsibilities are organized into the following System Layers:

System Layer	Description	Responsibility
Workstation	Desktop or laptop used to access Dexcom CLARITY®, including hardware, software, environment, and people.	User/Clinic
Application Use	Use of Dexcom CLARITY® application.	User/Clinic
Application Design	Design of Dexcom CLARITY® software.	Dexcom
Infrastructure	Servers, operating systems, network configuration, and supporting systems used to operate Dexcom CLARITY®.	Dexcom

Users

We use the following definitions in this document:

Users: Home Users and Clinic Users.

Home Users: Patients of Dexcom CLARITY®.

Clinic Users: Dexcom CLARITY® clinician users (both staff and administrator roles). Does not include Home Users.

Security Controls

The following tables describe Dexcom CLARITY® security management for each subsection of ISO/IEC 27002:2013. Each subsection provides a description of the responsibilities of Dexcom and the responsibilities of the Clinic regarding its Clinic Users and their use of Dexcom CLARITY®. Where appropriate, responsibilities are divided by System Layer.

Home Users are responsible for the security of their own Dexcom CLARITY® User account and the security of their network, computers and data.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Access Control

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Business requirements of access control	Access to Infrastructure is on a need-to-have basis. Network access to Infrastructure is denied by default, and only explicitly allow.	Management of Workstation and Application Use.
User access management	Application Design: • mechanisms to allocate, remove, and review access rights for Clinic Users • mechanisms to manage Clinic User passwords Infrastructure: management of user access and passwords.	Workstation: management of user access and passwords. Application Use: allocation, removal, and review of access rights for Clinic Users.
User responsibilities	Dexcom employees and contractors with access to PHI receive training on their security responsibilities.	Security responsibility training for Clinic Users.
System and application access control	Application design: • implementation of login and access control mechanisms • logical partitioning of data between customers Infrastructure: Access is restricted to a secure VPN.	Access control for Workstation.

Cryptography

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Cryptographic controls	User data is encrypted in transit with TLS 1.1 using modern cryptographic algorithms (AES-128 or 3DES). User data is encrypted at rest using AES-256.	Workstation must provide modern web browser with modern cryptographic algorithms enabled.

Physical/Environment Security

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Secure areas	Physical security for Infrastructure is managed by an ISO 27001-certified datacenter.	Physical security of Workstation environment.
Equipment security	Equipment security is managed by an ISO 27001-certified datacenter.	Equipment security for Workstation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Operations Management

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Operational procedures and responsibilities	Policy and procedures are maintained in ISO 13485 certified Quality System, implementing Change management, performance and capacity management, and separation of production and test environments.	Policy and procedures for Workstation management.
Protection from malware	Infrastructure not accessible to end users with software installation performed by controlled systems.	Malware management for Workstation.
Backup	Infrastructure backed up daily with three redundant off-site copies on the East Coast. Yearly disaster recovery tests.	Disaster recovery for Workstation.
Logging and monitoring	Application design: mechanism for audit of user actions, including who performed the action, when the action was performed, and the IP of the user performing the action. Infrastructure: system exceptions, system activity, and authentication events for maintenance access are centrally logged. Server clocks are synchronized.	Logging and monitoring for Workstation.
Control of operational software	Infrastructure: software is centrally controlled using automation software.	Management of Workstation software.
Technical vulnerability management	Monthly vulnerability scanning of Infrastructure. Vulnerabilities are tracked and remediated according to Dexcom policy.	Vulnerability assessment and remediation for Workstation.
Information systems audit considerations	Dexcom performs yearly HIPAA audits of its information systems security practices.	Audits of Workstation management.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Communications Security

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Network security management	Infrastructure is segregated from the internet in a private network with explicit entry points. No wireless networks are permitted within Infrastructure.	Workstation network security management. Internet connection of 1.5 Mbps or better.
Information transfer	Data transfer between Dexcom and third parties is controlled by policy and agreement.	Management of data transfer policy and agreement.

Systems Acquisition, Development and Maintenance

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Security requirements of information systems	Software security requirements are controlled as software requirements and analyzed as part of software risk management.	N/A
Security in development and support processes	Software requirements are tested as part of software verification. Development environment is secured according to Dexcom policy.	N/A
Test data	Test data is controlled on private environments.	N/A

Supplier Relationships

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Information security in supplier relationships	Relationships with third party suppliers for Infrastructure and Software Design are controlled by Dexcom policy. Dexcom's business associates execute business associate agreements with Dexcom. Appropriate confidentiality provisions are entered into between Dexcom and our customers and vendors.	Relationships with third party suppliers for Workstation.
Supplier service delivery management	Third party suppliers are qualified and managed in the Dexcom Quality System.	Service delivery management of third party suppliers for Workstation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Information Security Incident Management

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Management of information security incidents and improvements	Infrastructure and Software Design security incidents are investigated and reported to Dexcom Quality. Confirmed security breaches are reported to affected customers within 48 hours of confirmation.	Management of Workstation and Software Use security incidents.

Information Security Aspects of Business Continuity Management

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Information security continuity	Infrastructure and Software Design disaster recovery is managed by Dexcom procedure, with yearly tests.	Disaster recovery for Workstation.
Redundancies	Servers are configured for high availability using redundancy across datacenters.	Redundancy of Workstation.

Legal/Compliance

27002 Subsection	Dexcom Responsibility	Clinic Responsibility
Compliance with legal and contractual obligations	Acts as a covered entity under HIPAA, in accordance with 45 CFR 160.103. Dexcom can also receive PHI under 45 CFR 164.512(b)(iii), and in doing so we are not acting as a business associate. Dexcom follows applicable regulatory controls, laws, contract obligations and standards for the classification of data associated with Dexcom CLARITY®. Use of Dexcom CLARITY® is subject to the applicable terms of use and privacy policy available at www.dexcom.com.	Clinic acts as a covered entity under HIPAA. Clinic is responsible for compliance with its obligations under HIPAA and other regulatory controls, laws, contract obligations and standards applicable to Clinic and Clinic Users.
Information security reviews	Dexcom performs yearly HIPAA audits of its information systems security practices.	Audit of information security policy and procedures.

For technical assistance with CLARITY please contact Dexcom Technical Support: Telephone: 1-888-738-3646, Email: techsupport@dexcom.com

Smart Cities Challenge Project

Re: Smart City Challenge Privacy Impact Assessment (PIA)

Dear Ms. Neufeld:

Our office has appreciated the opportunity to work with your group as one of the 20 Smart Cities Challenge finalists in the development of the 'Data and Privacy' components of your final proposal in the finalist phase of the competition.

Our office has reviewed your Preliminary Personal Health Information PIA and, in our view, it demonstrates your commitment to responsibly managing data through its lifecycle with security and privacy considerations addressed. We are satisfied that you have thoroughly considered the privacy implications of your project.

We wish you luck in the next phase of the Smart Cities Challenge.

Sincerely,

M. Cormier

4. Letter to the OPC

March 4, 2019

Ms. Nishi Malik, JD
Senior Advisor, Business Advisory Directorate
Policy and Promotion Sector
Office of the Privacy Commissioner of Canada
655 Bay Street, Suite 404
Toronto, ON M5G 2K4

Dear Ms. Malik,

Re: Smart Cities Challenge Finalist: Town of the Pas, Opaskwayak Cree Nation, RM of Kelsey

Thank you for reading the initial "PIPEDA – Preliminary Privacy Impact Assessment" document which was submitted to you on our behalf by the Manitoba Ombudsman's office. We appreciate the time you took to review our submission and provide us with your comments. The template your comments were provided on is most informative in helping us understand, in detail, the requirement of the preliminary PIA document. Upon review of your comments, we have revised our document to reflect more clearly how the commercial activities proposed in our project intend to meet the requirements established in the PIPEDA legislation. We have enclosed a copy of the revised document for your information.

We recognize that this is a preliminary document and upon implementation of our project, we will contact you and complete a comprehensive privacy impact assessment.

Thank you for your support of our project and we look forward to working with you in the future.

Sincerely,

Rose Neufeld, Project Coordinator
Tri-Council Smart Cities Challenge Finalist

EXECUTIVE SUMMARY
Opaskwayak Cree Nation, The Town of The Pas, and The Rural Municipality of Kelsey in Manitoba have entered into an informal relationship through a friendship accord and work together to address issues common to each of their respective governments to build a better future for generations to come.

We have entered the Smart Cities Challenge, an initiative of Canada Infrastructure which called for project proposals using technology to address issues that face the community, including the internet of things, connected technologies, and big data. As a finalist in the Challenge, we are competing for a $10M award to implement our project.

Our project is directed at improving the health of community members through the provision of direct to door food distribution of locally grown food, produced at the Smart Farm, which can be ordered via a smartphone application.

As per federal regulation, the personal information protection and electronic documents act (PIPEDA) governs the collection, distribution, and use of personal information of Canadians by business entities in the course of commercial activity. Given that this project includes the operation of a business that will undertake collection of personal information from community members, the Office of the Privacy Commissioner of Canada (OPC) has been consulted on implementation of personal information collection, distribution, and use principles that will need to be addressed in the implementation phase of this project. To date, feedback has been provided by OPC on a preliminary submission of data management policies, and this feedback has been incorporated into the development of this preliminary privacy impact assessment for the project proposal. Further consultation will be initiated with the OPC through the implementation phase to ensure this project's commercial activities are compliant with federal legislation.

BACKGROUND
This new program is being implemented because currently, and historically, access to healthy food is very difficult for our community, located in northern Manitoba. The distance that food must travel to reach our community results in high costs, low quality and early spoilage rates. This makes it difficult for many of our community members to purchase fresh food to feed their families. This has resulted in many families

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

including little or no fruits and vegetables in their daily diet. The project we are implementing will assist in making food available and the study we are proposing will create a base of knowledge and a core group of individuals that become aware of the link between physical biometrics such as blood glucose levels and consumed foods. Our goal is to reduce the rates of diabetes and provide our community members with options to attend to their health through accessibility to healthy foods.

We are utilizing technology to help us address the problem of adequate food supply knowing that new and innovative measures are required as the current means of acquiring healthy food is not addressing the increasing poor health statistics in our community.

GENERAL

As discussed in our accompanying Chapter 7 in which this PIA is referenced, the commercial activity detailed in our proposal for the Smart Cities Challenge occurs between the community members (customer) and the not-for-profit corporation (to be established in the implementation phase, herein referred to as the NFP). The customer, through the smart phone application, which will be developed upon success in the Challenge, creates an account which requires submission of personal information to the NFP including their name, address, contact information, and optionally payment. Upon creation of an account, the customer can view the product list, recipe list, their order history and their order status after they have completed a purchase. Placement of an order requires submission of payment information through the application or pre-loading of their account through cash deposits at the plant factory location. Their order is identified by a transaction number and a transaction receipt is issued.

Upon success of our proposal, we will be completing a more comprehensive privacy impact assessment by utilizing the federal privacy impact guidelines and other resources including the PIPEDA Privacy Assessment tool. We recognize that the elements that require consideration when we implement the project include:

- Be accountable
- Identify the purpose
- Obtain valid, informed consent
- Limit collection
- Limit use, disclosure and retention
- Be accurate
- Use appropriate safeguards
- Be open
- Give individuals access
- Provide individuals with an avenue for recourse

PROJECT PIPEDA BOUNDARIES

Personal Information:

Upon downloading the smartphone application used for placement of order to the NFP, customers will be required to create an account before they can access information and resources provided by the application. Creation of an account will involve the **collection** of personal information and is thus subject to PIPEDA

considerations. The minimal amount of personal information needed in order to effectively deliver services will be collected. Personal information items that will be collected by the application include:

- Name
- Address
- Contact information
- Payment information
- Order details

This information will be **used** by the NFP for internal business operations including:

- Packaging identification
- Product identification
- Location of order delivery

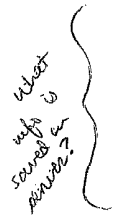
Information will only be provided to employees of the the NFP on a need to know basis, in further pursuit of compliance with PIPEDA.

There are two methods that will be available to customers for processing payment; credit card or preloaded account balance. Preloading of the customer's account can occur by depositing cash or cheque at the plant factory. However, processing of credit card payments requires the **disclosure** of personal information to the financial institution in order to process the transaction.

It is understood that any personal information **collection** or **disclosure** event must solicit the express consent of the customer in order to ensure compliance with PIPEDA legislation. In pursuit of compliance with this legislation, a notice of data collection window will be displayed to the customer upon prompting the creation of an account with the NFP and must be agreed to prior to submission of any personal data. Secondly, a notice of disclosure window will be displayed, and must be acknowledged by the customer, prior to processing any transaction via credit card to ensure informed consent regarding NFP's required **disclosure** of personal information to perform this activity.

Customers will, at any time, be able to delete their account with the NFP through the smartphone application interface, thus deleting the existence of their personal information from the customer database. However, in compliance with financial legislation, there will be a record kept of any purchase transactions that the customer processed with the NFP. Furthermore, under PIPEDA legislation, customers have the right to request a copy of their personal information or request a correction of this information held by a business entity at any time. This will be observed by the following two measures:

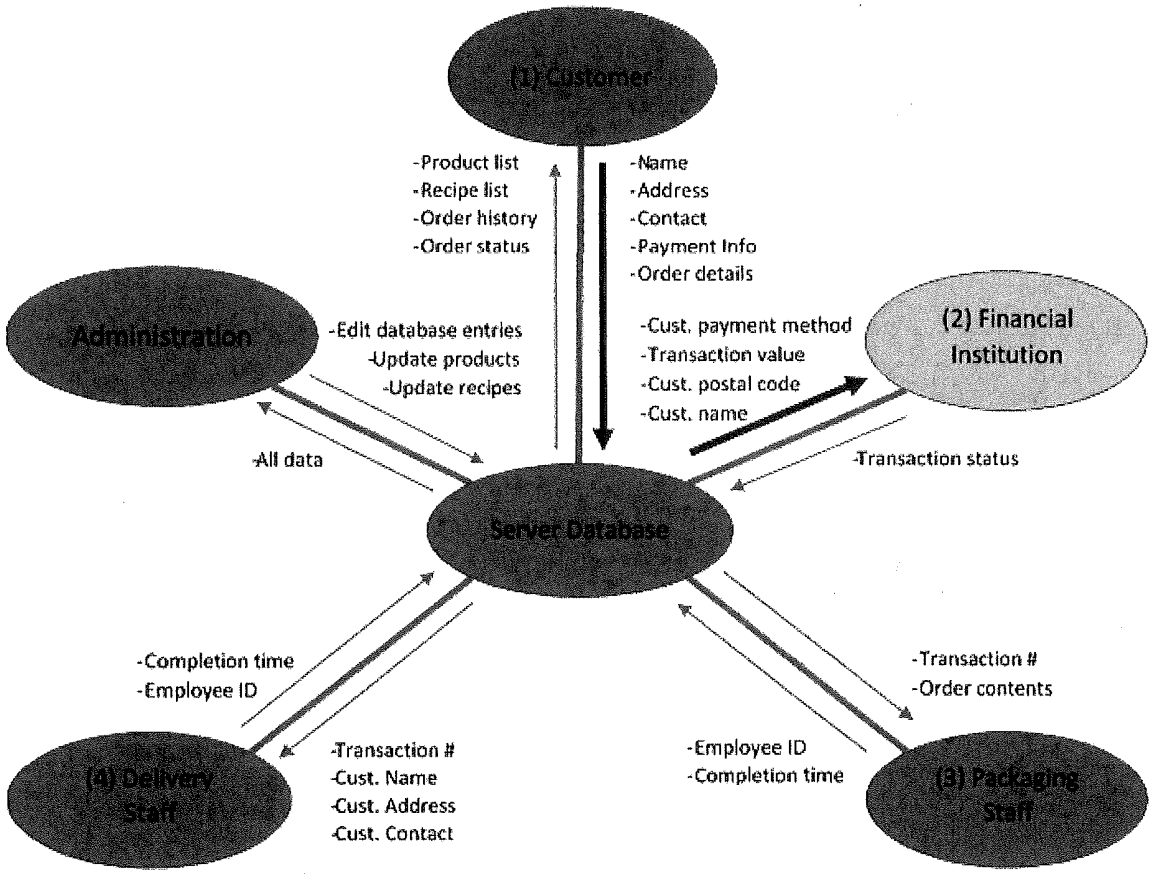
1. Customers have 24-hour access to their personal information held on the NFP server through the smartphone application
2. Customers can contact the manager of the NFP in order to access their personal information



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The smartphone application required for this project currently does not exist. Therefore, a software development contractor will be hired for the purposes of creating the required software solution. Furthermore, this company may be used from time to time to provide application updates to ensure compatibility with future operating system releases or to increase/modify features incorporated into the smartphone application. However, there is no anticipated disclosure of personal information through this process. To make this delineation clear, the following is a brief overview of the software architecture.

The smartphone application software will operates using three components:



- A frontend application
- A backend application
- An information database

The frontend application is the smartphone application that customers will download and run on their smartphone. This application will be placed on the Android Play store and the Apple Store so that it is easily accessed by all who desire to use the services of the NFP. The backend application resides on a server that will be located on the NFP business premises. The frontend application communicates with the backend application over the internet. The function of this backend application is to process commands and translate/organize information stored within the database so that it is correctly displayed on the smartphone application. To ensure data security at the place of residence, user information will be encrypted on the server hard-drive. To ensure data security within all internet-based communication links, industry standard TLS encryption will be used.

The software developer will create the code for the frontend application, the backend application, and the framework for the information database. During the development of these codes, or during the updating of these codes at a future date, the software developer does not require access to the database, they only require access to the frontend application and/or the backend application. Consequently, there is no disclosure of personal information to this third party at any time.

Personal Information Flow:

Disclosure Statement:

A notice of personal information collection statement must be agreed to by the customer prior to the NFP's collection of personal information. This statement will be displayed when the customer initiates account creation within the NFP's smartphone application. An example of a notice of personal information collection statement is:

By continuing with the creation of an account with the NFP corporation, you are agreeing to the collection and use of your personal information for the purposes of providing the services that the NFP corporation is offering.

A notice of personal information disclosure statement must be agreed to by the customer prior to the processing of payments for food products offered by the NFP. This statement will be displayed every time the customer initiates payment using a credit card as this requires disclosure of personal information to the financial institution. An example of a notice of personal information disclosure statement is:

By continuing, you understand and agree that your Name and Postal code will be disclosed to the financial institution for the purposes of processing the transaction.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CONCLUSIONS

OPC has developed resources that will prove valuable to a comprehensive completion of a PIA when we enter the implementation phase of our project. Documents that will be utilized to accompany the PIPEDA privacy law include the PIPEDA Self-Assessment Tool, the Privacy Toolkit for Businesses, Issue-specific guidance for businesses and PIPEDA compliance and training tools. It is our goal to follow all regulations pertaining to the protection of personal information in this project.

Commissariat à la protection de la vie privée du Canada | Office of the Privacy Commissioner of Canada

Smart Cities Challenge 2019

Preliminary Privacy Impact Assessment Form

Finalist: Town of The Pas, Opaskwayak Cree Nation, Rural Municipality of Kelsey, Manitoba

1. Description of personal information or personal health information to be collected, used or disclosed (CUD)	Yes	No	Partially
			✓

Comments:

- Our Office received the PPIA documents on February 26th. As such, we did not have sufficient time to review any other documents provided by the finalists other than "Chapter 7: Data and Privacy" and "Appendix B" what is this document?
- Finalist discusses personal information it intends to collect and use.
- Unclear about disclosure of personal information. Finalist states: "No disclosure of any information outside of the business units will occur." Explanation would be helpful on who these business units are (if they are internal to the owner/manager of the app and/or the smart farm), what personal information is disclosed to them and for what purpose (i.e. a transaction service which supports the processing of payments, a delivery service who would need addresses to deliver food, etc.).
- Finalist discusses importance of minimizing collection of personal information; provides alternatives such as paying for products in cash versus using a credit card.

2. Information flow map that outlines each CUD of personal information or personal health information, with a corresponding legal authority for each flow	Yes	No	Partially
			✓

Comments:

- Consider providing the flow of personal information in a diagram or a table. It might be a helpful way to communicate the personal information involved in the vertical smart farm sales processes (setting out what information will flow to what party, based on what conditions). Example:

What data?	Data Flows to?	Cause of flow
Name Address Phone Number Email Address	Mobile application	Entered into app by user
Name Address Phone Number Email Address	Food delivery service	Food order made by user

This evaluation is completed with regard to Page 27 of the Smart Cities Challenge Finalist Guide.

Credit Card Information		
X	Tri-Council Not-for-Profit Management Corporation	Z

...and so on.

This is not necessary to include in the PPIA, but it would help to provide clarity for the various services being offered through the app.

- As discussed above in section 1, please illustrate flow of personal information in relation to any disclosures.
- Would any personal information be collected from, used by or disclosed to Tri-Council Not-for-Profit Management Corporation? If so, please explain under what circumstances.
- Would any personal information be collected from, used by or disclosed to Opaskwayak Cree Nation? If so, please explain under what circumstances.
- Would any personal information be collected from, used by or disclosed to Northern Regional Health Authority? If so, please explain under what circumstances.
- Identify all parties besides the user who have access to the user's personal information.
- Who is creating the app, and does that party have access to the personal information, does it retain or manage the personal information? If so, identify the app developer and their role and responsibilities in relation to the personal information. Consider entering into a contractual agreement with the app developer/manager to ensure that it handles personal information in compliance with PIPEDA. The agreement should include language that restricts their use of the personal information to tasks they are contractually obligated to complete and nothing more. This engages several PIPEDA principles including Accountability and Limiting Use, Disclosure and Retention.
- Who owns the server and who has access to it? What personal information will be stored in the server?
- Note: there is a reference to accessing the technology of vendors (Pg 4). Did you mean that these vendors would be accessing your technology?

3. Description of who you will collect personal information or personal health information from to enable the project with assessment of that person's authority to disclose the information	**Yes**	**No**	**Partially**
		✓	

Comments:

- Although the finalist indicates the user will be providing the personal information directly, no explanation is provided about the consent process. Further explanation provided below in Section 5.
- As mentioned above, need to know whether or not any personal information is being provided by any third parties. If so, explanation needed to understand what authority that third party has to disclose the personal information i.e. do they have consent from the individual to make the disclosure?

4. Information governance plan	**Yes**	**No**	**Partially**
			✓

Comments:

This evaluation is completed with regard to Page 27 of the Smart Cities Challenge Finalist Guide.

- The finalist states that it intends to develop a privacy policy.

5. Organizational privacy management framework, including related organizational access, correction, privacy and security policies	Yes	No	Partially
			✓

Comments:

Terms of Use

- Finalist indicates that app users will be required to agree to **Terms of Use**. Terms of Use are not an appropriate method of informing users about how their personal information may be collected, used and disclosed and obtaining their consent to same. The Disclosure Statement provided in Appendix B is more appropriate. Did you mean that app users will see and read the Disclosure Statement before they use the app for the first time?

Is this different from notice

Consent principle:

- The above comments tie in with obtaining the individual's consent for collection, use and disclosure of their personal information. The principles requires the consent and knowledge of the person and to make consent meaningful, the purpose must be stated in a manner that the person can reasonably understand

Identifying Purpose principle:

- Per the PIPEDA principle of Identifying Purpose, users must understand before or at the time of collection, why their personal information is required. Consider providing users with information, prior to the time of account creation, what personal information they will be required to provide, how it will be used, how it will be disclosed, to whom, and why.

6. A plan that outlines the way in which you will consider privacy and security risks throughout the process including to complete a comprehensive PIA	Yes	No	Partially
	✓		

Comments:

- Finalist considers and addresses some risk mitigation practices.
- Finalist notes that personal information will be transmitted through a server and will be encrypted.
- Finalist also notes that communication will be encrypted. Unclear as to what communication entails.
- Recommend a privacy policy that is easily accessible to users. Be sure to include the name and contact information of the person to whom any questions about privacy procedures can be directed.
- There is discussion about vendors involved who will be involved with this project. We recommend you consider entering into contractual agreements with them in which they agree to safeguard the personal information disclosed to them accordance with applicable privacy legislation, and they only use the personal information as is permitted by the contractual arrangement.
- Recommend PIPEDA-related privacy training for all staff (including packaging and delivery staff) involved with the business that relates to their obligations under PIPEDA
- Finalist identifies a retention period of 7 years for financial transactions and indicate that personal information will be deleted, however finalist does not identify when the personal information will be deleted. Is the financial transaction record devoid of all personal information?
- Should the application be successful, we would invite the finalist to work with us to ensure that the "10 Principles" of PIPEDA are accurately interpreted and properly applied.

This evaluation is completed with regard to Page 27 of the Smart Cities Challenge Finalist Guide.

PRIVACY IMPACT ASSESSMENT

PROJECT	Net Energy Zero Housing Project
ORGANIZATION	Cree Nation of Eastmain
PROJECT LEAD	[redacted] Director General

1. BACKGROUND

The Cree Nation of Eastmain (CNE) is a finalist in the Smart Cities Challenge. It proposed to create a Net Zero Energy housing program to respond to its critical housing shortage. As part of its proposal, the CNE must consider the privacy implications and its plans for ensuring privacy compliance.

Eastmain is located in Northern Quebec along the eastern shore of the James Bay.

2. LEGISLATIVE AUTHORITY

The CNE is a Cree First Nation. Pursuant to the *Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada*, the CNE acts as a local government authority in Eastmain. It administers the assets of the First Nation, manages the land and the buildings and establishes, delivers and administers programs and services for members.

An important program operated by the CNE is housing. The CNE constructs housing to rent to members and obtains loans through Canada Mortgage and Housing Corporation for social housing. In order to address the severe housing shortage, the CNE intends to establish a program that offers affordable private homeownership and rental housing and addresses some of the issues facing on-reserve housing.

The Agreement concerning a *New Relationship between the Government of Canada and the Cree of Eeyou Istchee* first addressed housing in the Cree communities. This agreement confirmed the powers of the First Nations to adopt by-laws with respect to housing.

Under the *Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada*, the Cree Nation government receives and distributes funding paid to the CNE pursuant to the *James Bay and Northern Quebec Agreement*. As such, the criteria and information requirements of the NZE housing program are designed to comply with the Cree Nation Government's criteria for housing as non-compliance with such criteria will impact the CNE's eligibility for funding for housing.

The CNE is in the process of implementing an integrated management system auditable to ISO Standards; 9001:2015 Quality Management; 20000-1:2011 Information Technology Service Management; and 27001:2013 Information Security Management. It is therefore alive to the need for rigorous information and data management protocols that ensure personal and confidential information are properly collected, managed and stored.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3. PROJECT DESCRIPTION

The Net Zero Energy (NZE) housing program ~~focusses~~ focuses on the construction of new single-family and multi-unit homes and retrofitting existing homes. The NZE housing program will complement the existing rental and social housing programs.

Key personal information will be collected to ensure that housing is allocated appropriately, reflects the needs of its members and their financial capacity.

In addition, the CNE has already conducted an inspection of existing homes to identify deficiencies. This information will be used to determine the homes that are suitable for renovations and NZE retrofitting. The information respecting these homes is relevant for determining which ones will qualify for retrofitting.

The NZE housing program will involve the participation of other organizations. These organizations are: (a) Concordia University and (b) McGill University. In addition, the CNE will engage engineering firms and contract with suppliers for the purposes of carrying out construction or retrofitting of the homes.

4. PROJECT ACTIVITIES

The NZE housing program will involve the collection, use and storage of various types of data.

Rental Housing

The CNE collects the information described below during the housing application process. All of the information is provided directly by the applicant or is obtained with the consent of the applicant. The information is collected solely for the purposes of administering the rental housing program (*Risk level 2*) and evaluating and prioritizing the housing application.

Information	Purpose	Risk
Name of applicant(s)	Identification	1
Status/Membership	Contractual obligation that social housing be attributed to members	1
Family size	Determine housing needs	1
Total household income	Determine rent	3
Health conditions	Determine special housing needs	3
Rental arrears	Determine eligibility for new housing	3
Credit rating	Verify capacity to pay	3

The CNE is required by the policies of the Cree Nation Government to collect and use certain personal information when allocating rental housing. Social housing is geared toward the financial capacity of occupants and is intended for lower income families.

The above information is collected by the Rental Housing Department (the "Department") when the member completes an application for rental housing and consents to a credit

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

check. The information collected is used solely for the purposes of evaluating the applicant's request for housing and determining the applicant's capacity to pay.

Private Homeownership

Information	Purpose	Risk
Name of applicant(s)	Identification	1
Status/Membership	Contractual obligation that social housing be attributed to members	2
Family size	Determine housing needs	2
Loan information	Confirm ability to pay for the construction of house	3
Health conditions	Determine special housing needs	3
Rental arrears	Determine eligibility under policies	3
Credit rating	Verify capacity to pay	3

In order to purchase or construct a home, members must comply with CNE policies and Cree Nation Government policies governing the private homeownership program. This program enables members to obtain grants to assist with the construction. The CNE will be required to be informed of financing arrangements with financial institutions because these institutions often require the Cree First Nations to guarantee loans to their members.

The information collected from private homeownership applicants will be used solely for the purposes of administering this program and evaluating eligibility of the applicants.

Homes built under the private homeownership program will be subject to contracts between the homeowner and the builder. The CNE will be required to collect the below business information in order to ensure that builders qualify under the Cree Nation Government policies.

Information	Purpose	Risk
Business Name	Identification	1
Ownership	Policy requirement	1
Operational Structure	Policy requirement	1
Regie du batiment licence	Verify qualifications	1
Financial information	Confirm financial ability to build houses	3
Debts with CNE	Determine eligibility under policies	3

Many of the local builders are sole proprietorships or partnerships with few incorporated companies. All the information is collected directly from the builders or from third parties with their consent. Certain information is publicly available because of reporting requirements under Quebec law.

The above information is collected solely to determine builders' eligibility to construct homes under the private homeownership program.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Retrofitting

The CNE intends to retrofit existing qualified homes to make these more energy-efficient. Retrofitting work may be done in-house by the Department or contracted out to local builders. There will be no exchange of personal information. Generally, the retrofitting work on existing homes will require limited entry into homes or contact with occupants as most work will be carried out on the exterior.

Partners

CNE is working with Concordia University and McGill University to measure the success of the NZE housing program. Concordia University will collect and analyse quantitative data while McGill University will collect and analyse qualitative data. Both partners are subject to their respective privacy policies and protocols (*Risk Scale 1*).

how about PIPEI

Concordia University

Concordia University will carry out field monitoring and detailed modelling with respect to the NZE homes and retrofits in Eastmain.

The performance data will enable Concordia University and CNE to validate performance and improve the design, construction and operation of NZE homes. The field data will be collected for the purpose of measuring the actual net-zero energy of the houses and how occupants interact with and operate their NZE homes. The information collected is identified below and will not be used to make decisions about an identifiable individual (*Risk Scale 1*).

personal information

Information	Purpose	Risk
Address	Identification	1
Hygrothermal Performance	Research	1
Electricity Consumption	Research	1
Energy Performance	Research	1
Indoor Air Quality	Research	1
Thermal Conditions	Research	1
Energy Generation	Research	1

Information respecting indoor environmental quality will be shared with McGill University to assist in the qualitative analysis.

McGill University

McGill University will be conducting a qualitative study to determine the level of satisfaction of the occupants of NZE homes. McGill University will collect the information identified below directly from occupants except for certain quantitative data relating to the NZE homes that will be provided by Concordia University.

The information will be collected for research purposes and to determine the success of the NZE housing program from a social perspective. The information collected will not be used

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

to make decisions affecting identifiable individuals (*Risk Scale 1*) but will assist the CNE in improving its NZE housing program.

Information	Purpose	Risk
Name	Identification	1
Family Size	Research	1
Address	Identification	1
House Model/Size	Research	1
Comfort	Research	2
Satisfaction	Research	1

The information collected by McGill University will be anonymized before being used for research purposes and before it is disclosed to any third parties in reports on the social success of the NZE housing program.

5. TERM

The NZE housing program is intended as a long-term program (*Risk Scale 3*). Data collection activities will be carried out throughout part of the program in order to measure success, identify concerns and deficiencies and adjust the program accordingly.

6. POPULATION

The information collection and use activities of the CNE NZE housing program will be limited to CNE members.

The personal information collected by the CNE will be used internally to administer its housing program. The information will be used to make decisions respecting the allocation of rental housing and the approval of grants for private homeownership. The information will therefore affect every applicant for rental housing or private homeownership (*Risk Scale 3*).

No personally identifiable information will be used or disclosed by Concordia University or McGill University. Reports prepared by the CNE and its partners on the success and details of the NZE housing program will be anonymized or will focus on technical aspects of the program.

7. TECHNOLOGY

The CNE recently made changes to its information technology system to ensure better functioning and security. The implementation of the NZE housing program will not require the introduction of new information technologies or software to support the collection, use or storage of personal information.

However, the NZE houses will be equipped with connective technology allowing Concordia University to monitor and measure field data and performance data. Moreover, most homes

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

are already equipped with smart meters that provide accurate and up-to-date information on energy use.

8. INFORMATION TRANSMISSION

CNE, Concordia University and McGill University will collect, use and store information in different ways.

Cree Nation of Eastmain

Certain information about members is already maintained on the CNE information system including

(a) name,
(b) band number,
(c) date of birth, and
(d) address.

This information is required to access funding, ensure members can access programs and services offered by the CNE and by other Cree entities. The CNE information system is connected to the internet but the personal information is not shared electronically with any third party (*Risk Scale 2*).

The CNE uses paper application forms that members complete and submit to the Department (*Risk Scale 1*). The forms are kept in a secure place in the Department and the information is accessed solely for the purposes of allocating rental units and under the NZE housing program will be used also to process applications under the private homeownership program.

The CNE will not disclose information it collects to any third party except as required by law or policy. Only information relating to the addresses of NZE homes will be disclosed by the CNE to its partners, Concordia University and McGill University.

Concordia University

Concordia University will receive the personal information identified in section 4 electronically through connective technologies and this information will be analysed within its information system (*Risk Scale 2*). Other than the house address, no other personally identifiable information will be transmitted.

The information obtained and used by Concordia University will not permit the identification of an individual.

McGill University

McGill University will collect data directly from individuals at meetings, talking circles and other forums. The information collected will be used and stored on a closed system that has no connectivity to the internet or other systems (*Risk Scale 1*).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Prior to any reporting, the information obtained by McGill University will be anonymized to prevent the identification of those individuals who participate in the forums.

9. RISKS

It is unlikely that a privacy breach in respect of the information collected by Concordia University or McGill University would impact the individuals concerned by the information.

A privacy breach of CNE-held information could impact the individual concerned by that information.

In the event of unauthorized or accidental disclosure or access, the CNE will notify the affected individual(s) and make efforts to mitigate the privacy breach by ensuring the employees responsible are given proper training and information in order to prevent future privacy breaches. Employees who intentionally access or disclose personal information may also be subject to disciplinary measures, such as suspension or termination, under CNE policies.

The CNE is also preparing policies respecting the classification of information and identifying the levels of access and protection required. Employees will be trained on these policies to ensure that information is treated according to its nature and degree of confidentiality.

10. ANALYSIS

The NZE housing program will involve the collection, use and retention of personal information, of varying degrees of sensitivity. The CNE intends to comply with fair information principles.

Accountability

Pursuant to the *Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada* and the *Constitution of the Cree Nation of Eeyou Istchee*, the CNE must establish ~~establish~~ access to information procedures with respect to information in its control. The CNE is implementing a process for classifying information and establishing the level of protection required.

Presently, CNE agreements contain provisions respecting confidentiality and, with respect to service providers, retention and disclosure restrictions.

With respect to the NZE housing program, information collected by Concordia University and McGill University will be held be those institutions. CNE will only receive the results of the studies conducted by its partners which will not contain information allowing the identification of an individual.

Purpose

The CNE has held public meetings with its members in designing the NZE housing program. As well, housing continues to be tabled at public meetings. Members are informed regularly of the information requirements for housing. The new regional policies will be coming into

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

force and the NZE housing program will involve further consultation with members. At these meetings, the CNE will inform members of the type of information that will be required and the purpose.

Prior to all collection of information, the individual is informed of the reasons for which the information is collected, how it will be used and whether it will be shared with other organizations.

Consent

The CNE collects and holds information relating to members under other programs. Unless the member consents to its disclosure to the Department, the CNE must request that information directly from the individual. As such, the CNE only uses personal information for the purposes for which it was originally obtained.

The name and address of the individual as well as information relating to membership are generally publicly known given the size of Eastmain. While the CNE may have a general understanding of certain health conditions, this information must be obtained directly from the individual or, if incapable, from that individual's caregiver.

Limit Collection

The information collected by the CNE will be that information required for the purposes of administering the NZE housing program and complying with the CNE housing policies and the policies to be adopted by the Cree Nation Government.

The information collected by Concordia University and McGill University is necessary to enable the analysis of the net-zero energy technologies, construction systems and to measure the success and individual satisfaction with the NZE homes to be built in Eastmain.

Limit Use, Disclosure and Retention

The information collected by the CNE will be used exclusively for the purposes of administering its housing program. The information collected will not be disclosed to third parties except as required by policy. Disclosure to the Cree Nation Government may be required under its policies and funding arrangements with the CNE. Otherwise, the CNE does not disclose information collected from members to third parties. Depending on the housing program, and the type of information collected, information is held for the duration of the housing project (i.e. until full payment) or until it is no longer relevant (such as a change of occupant).

Information collected by Concordia University and McGill University will be used solely for research purposes. No information will be disclosed that relates to an identifiable person. Generally, the information obtained by these institutions will be anonymized before it is disclosed to the CNE.

Accuracy

Because personal information is collected for the purposes of administering the housing program, it is important that it be accurate and up-to-date. Under CNE policies personal

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

information must be updated every two years to ensure its accuracy. Individuals may also periodically update or modify their information as required.

Safeguards

The CNE implemented an integrated management system auditable to ISO Standards; 9001:2015 Quality Management; 20000-1:2011 Information Technology Service Management; and 27001:2013 Information Security Management. It therefore has put in place information and data management protocols to ensure that personal and confidential information are properly collected, managed and stored.

Openness

The CNE regularly holds public meetings at which its members are informed of policies, laws and programs. The NZE housing program and the housing policies have been discussed at these meetings to ensure that members understand the information requirements and the processes and policies surrounding the collection, use and retention of their information.

Access

Under the *Constitution of the Cree Nation of Eeyou Istchee*, the CNE must set up a process to respond to access to information requests. This will include identifying the person who will respond to such requests. Presently, members attend the CNE administration offices to request access to information and documents held by the CNE.

Individuals may access information pertaining to them to ensure its accuracy and make corrections. Generally, this is done directly with the department holding the information.

Grievances

Presently, if an individual believes that information held by the CNE is inaccurate or is used in a manner that is prejudicial a grievance can be made directly to the department head. If the matter is not resolved, then the matter is usually brought to the Director General or Council. This is an informal process. As mentioned above, the CNE must establish an access to information procedure that will also include a complaints procedure.

CONCLUSION

Any questions concerning this Privacy Impact Assessment may be addressed to the Project Lead.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Commissariat à la protection de la vie privée du Canada | Office of the Privacy Commissioner of Canada

Smart Cities Challenge 2019

Preliminary Privacy Impact Assessment Form

Finalist: Cree Nation of Eastmain

1. Description of personal information or personal health information to be collected, used or disclosed (CUD)	Yes	No	Partially
			✓

Comments:

Overall:

- Distinguish "personal information" from "non-personal information" with respect to collection, use and disclosure and specify what you determine to be personal information or personal health information. Note that PIPEDA does not cover personal health information. As such, the OPC is not in a position to comment on your reference to "health conditions" in the top table on Page 3. However, we suggest you create a separate category for personal health information, explain what that category specifically includes (i.e. health conditions of applicants), and clearly describe when personal health information is being collected, used or disclosed.

Collection

- With the following sentence in section 4, "[a]ll of the information is provided directly by the applicant ***or*** is obtained with the consent of the applicant", it appears CNE considers it adequate consent when information is obtained directly from the applicant. That is not necessarily so. According to the consent principle in PIPEDA, in order for consent to be meaningful the individual must also be made aware of and understand the purpose for which their information is collected. Consider providing a detailed description about your consent process

Use

- Under section 6, the third paragraph suggests that no personal information will be used by Concordia University, however addresses will be disclosed by CNE to Concordia and addresses are personal information.

Disclosure

- When information is required to be disclosed to the Cree Nation Government, is it personal information or personal health information? Consider whether disclosure can be limited.
- Please clarify the sentence in section 8 under *Cree Nation Government,* "[o]nly information relating to the addresses of NZE homes will be disclosed by the...and McGill University". Please specify what additional information, if any, is being referred to here. You could also use a definition, point to a table, etc. If only addresses of NZE homes will be shared, say that.

2. Information flow map that outlines each CUD of personal information or personal health information, with a corresponding legal authority for each flow	Yes	No	Partially
			✓

Comments:

This evaluation is completed with regard to Page 27 of the Smart Cities Challenge Finalist Guide.

- More clarity is needed on flow of specific information (for example, identify whether it's personal information or personal health information) between the parties. Consider making more references to the tables of types of data to be collected, used or disclosed, if it accurately represents the data flow.
- The PPIA stops short of discussing Concordia University or McGill University's policies in relation to the personal information or personal health information collected, used and disclosed as part of this project. Consider entering into contractual agreements with them with respect to their handling of personal information or personal health information associated with this project. In the alternative, CNE may wish to consider receiving assurances from the universities' that the personal information or personal health information will be handled according to applicable privacy legislation and their own privacy policies.
- In order for McGill to complete its qualitative study, is the collection of names and addresses of occupants of NZE homes necessary? Per the limiting collection principle in PIPEDA, personal information should only be collected if it is necessary. Consider whether McGill's qualitative study can be conducted without this personal information. If names and addresses are not collected, there may not be a need to anonymize the information before it is used for research and/or disclosed to third parties.
- Concordia University is expected to receive personal information identified in section 4 through "connective technologies." Consider specifying what this is. Per the safeguards principle in PIPEDA, consider whether there are adequate safeguards to protect the personal information or personal health information that will be transmitted via this method i.e. can it be encrypted, access provided to only those who need it, etc.
- Regarding legal authority for each flow: Concordia University and McGill University would be subject to privacy legislation in Quebec. Consider including a reference that indicates these two institutions are subject to applicable privacy law in Quebec.

3. Description of who you will collect personal information or personal health information from to enable the project with assessment of that person's authority to disclose the information	**Yes**	**No**	**Partially**
			✓

Comments:

- There is no description of how consent is obtained from the individual who provides his/her personal information or personal health information. There is only a statement indicating that CNE's Housing Department assumes consent is obtained when an individual directly provides their personal information or personal health information. Consider including a description of how consent is obtained from the individual. In addition, while the name and address of CNE members may be generally known given the size of Eastmain (reference to this made on Page 8 under consent), that does not constitute consent, nor mitigate the need to obtain consent, for the use of an individual's name and address.
- While it is clear that the purpose of collection was explained at public meetings during the design of the NZE program (this is in line with the PIPEDA principle of identifying purpose before or at the time of collection), consider including the purpose on the application form so that the applicant understands the purpose for why personal information is collected at the time of collection.
- With the statement in section 4, "[a]ll of the information...is obtained with the consent of the applicant", it appears some information about the individual will be obtained from third parties. If this is correct, what assurances do you have that the third party has the proper consent from the individual to disclose their personal information or personal health information to you? In addition,

This evaluation is completed with regard to Page 27 of the Smart Cities Challenge Finalist Guide.

identify who the third parties from whom the information is being obtained and specify what type of information it is (i.e. personal information or personal health information).			
4. Information governance plan	**Yes**	**No**	**Partially**
	✓		
Comments:			
• A plan is provided.			
5. Organizational privacy management framework, including related organizational access, correction, privacy and security policies	**Yes**	**No**	**Partially**
			✓
Comments:			
• PPIA generally discusses overall plan related to information, however, specificity is needed re: personal information and personal health information. • PPIA discusses steps in the event of a breach and corrective measures. • PPIA discusses need for improvement to technological controls and the need to set up a scheme for responding to access to information requests in accordance with PIPEDA principle of individual access. • PPIA discusses a grievance procedure in accordance with PIPEDA principle of challenging compliance. • Consider safeguards for connective technologies. • Consider training of individuals/employees re: collection, use and disclosure of personal information and personal health information. • Consider implementing a retention policy for the personal information and personal health information that is collected from CNE members; ensure Concordia and McGill's policies or agreements with CNE have same for the personal information or personal health information associated with this project.			
6. A plan that outlines the way in which you will consider privacy and security risks throughout the process including to complete a comprehensive PIA	**Yes**	**No**	**Partially**
	✓		

This evaluation is completed with regard to Page 27 of the Smart Cities Challenge Finalist Guide.

Comments:
• A general plan is provided. • Consider implementing a privacy policy. • No legend is provided for the numerical risk scale to describe what the values mean or how level of risk is evaluated. • PPIA states McGill will be anonymizing information prior to any reporting to prevent the risk of identifying individuals. How will McGill be anonymizing this information and how reliable is its process for doing so? Consider whether the information can be re-identified and how this risk can be mitigated.

This evaluation is completed with regard to Page 27 of the Smart Cities Challenge Finalist Guide.

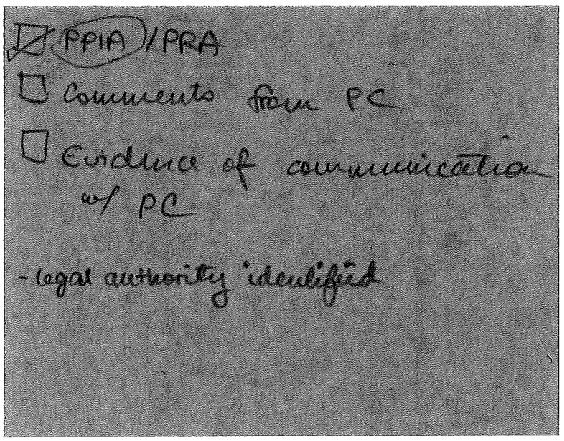
Executive Summary

Background

A Privacy Impact Assessment (PIA) is a risk management tool used to identify the actual or potential effects that a proposed or existing information system, technology, program, process or other activity may have on an individual's privacy. The purpose of completing this PIA is to identify the potential privacy impact resulting from our proposed project and the appropriate mitigations strategies. This PIA will cover all the proposed activities under the SMART Cities project and will consider all data stored and accessed through the Open edX platform including; Data Storage, Data Access, Data Retention and Data Disposal.

When developing this PIA, the project team referred to international, federal and provincial regulations regarding privacy to inform this PIA report. Also, throughout this project, the project team will continue to assess the project's privacy risks and impact to determine if there is a need to update the privacy analysis and/or the PIA report. This ongoing assessment is an essential part of identifying and mitigating new issues and changes impacting privacy that may arise during the implementation phases.

Privacy and Consent



Enrolment in this program is 100% voluntary and students and their guardian will be required to provide consent prior to beginning the program. Once consent has been given the student will need to create an account on the Open edX platform, which will be how students can access the language and STEM training. Teachers will be the only other party that has access to this information, to ensure accurate grading. Community, industry partners and stakeholders will not collect, use or disclose any personal information.

Information flows

This project involves creating a blended-learning environment with both online and real-world components. To create the online learning environment the Open edX platform we'll collect minimal personal information to create an account (i.e. name, user name and password). Additionally, certain functionalities of the Open edX platform, such as the meetup forum or time spent watching videos, will also generate data on a user's location and behavior patterns.

The project team will work with Technology/Software providers, including Appsembler, our chosen SaaS (Software as a Service) provider of Open edX, to enter into a contractual agreement which will ensure personal information is handled in a privacy-compliant manner, and restricts the third party's use of personal information for purposes outside the project scope. In all cases the user will be advised about any third party's privacy policies/statements when directed to a third-party site for additional links or resources, as part of informed consent process.

Data stored on the Open edX platform will be removed from the server following a student's successful completion of the program.

1.0 INTRODUCTION

Project Summary

Our Project Challenge Statement reads:

> *By means of active, cross-generational, technology-empowered, real-world participation in the intergenerational transfer of traditional Nishnaabe knowledge through the medium of our language, and the bilingual delivery of modern K-12 STEM knowledge, our community will transform our youth into better-educated, more-employable, better-grounded, and more holistically Nishnaabe people.*

The scope of our project includes the development of 2,000 hours of Nishnaabe-language immersion videos, the content of which will be our core aadsookaanan (our sacred stories, our philosophical foundations). It is intended that this will create understanders of our Nishnaabe language who can then go on to successfully complete an additional 1,000 hours of STEM educational video, the audio of which is delivered in our Nishnaabe language.

This project will move Nishnaabe people from being mainly passive consumers of technology to being active, effective STEM-educated administrators, managers, and users of data who are able to achieve meaningful outcomes for themselves, their families and their community. Upon completing high school, our youth will have received more than 2,000 hours of mobile-enabled, online Nishnaabe-language immersion instruction in all of our core aadsookaanan (sacred stories). Additionally, our youth will be able to comprehend spoken Nishnaabemwin and will have attained a basic proficiency in coding, robotics, and will possess a strong foundation in mathematics and science through an additional 1,000 hours of STEM curriculum. All STEM subject videos and courses will be available under a creative commons license, in both Nishnaabemwin and English. All of this education will occur in a blended-learning environment with a strong real-world participation component built into the program.

The eLearning functionality of our community's open source, mobile-enabled Learning Management System (LMS) - i.e., Open edX- facilitates the learning of the STEM subjects and the eAcquisition functionality of Open edX will facilitate the acquisition of our Nishnaabe language. The entire educational experience will be tied together with the meetup forum functionality of Open edX. This will serve as a bridge between the digital, online world and the material, real world. This forum will encourage and empower our youth to participate not only in online communities, but in the traditional Nishnaabe activities going on in the real-world community as well to add value to their overall learning experience. Based on this scope of work and objectives the following Project Management Plan has been developed to guide the project team through the implementation phases of this project and beyond.

Purpose of Privacy Impact Assessment Report

A Privacy Impact Assessment (PIA) is a risk management tool used to identify the actual or potential effects that a proposed or existing information system, technology, program, process or other activity may have on an individual's privacy. The purpose of completing this PIA is to identify the potential privacy impact resulting from our proposed project and the appropriate mitigations strategies. Notably, the PIA process is non-linear, as privacy concerns can and will continue to be identified over the course of the project's implementation. The appendices included with this report provide support to the process undertaken in completing the PIA.

Desired Response & Timelines

This PIA is being submitted to satisfy the requirements of the Smart Cities Finalist Challenge – Final Proposal. The project team is seeking prompt approval as required to proceed to the final proposal review stage.

Background

Scope of the PIA

Privacy is of the utmost importance to our leadership, project team and community as a whole. Much of the information we will be collecting for this project can be managed within the existing processes already managed by teaching staff (i.e. students names, grades, courses, contact information); however, given that this project entails a blended-learning environment, through the Open edX platform, this project will result in the generation of new data from users creating accounts on this platform. As such, this PIA will cover all proposed activities under the Smart Cities project, including all data stored and accessed through the Open edX platform. Considerations will also be made for Data Storage, Data Access, Data Retention and Data Disposal required throughout the lifespan of this project.

This PIA does not cover any existing processes in place to manage personal information already collected and managed within the community and school system that are not intertwined with the Open edX platform. For example, the Open edX platform does not provide the functionality to track course work completed only at the brick-and-mortar school, but only those K-12 curriculum augmentations that will be available on Open edX. As such, the only personal information that will be collected as part of this project will be generated from the user accounts, which will be accessible by the student and teacher only.

It should be noted that in addition to the information we collect via the Open edX platform, that as a 3rd party entity, users shall also be subject to the terms of this platform. Similarly, given that the Open edX platform links to 3rd party websites and embedded videos from 3rd party sites, users will similarly be subject to the privacy terms of these entities. As described within this preliminary PIA, the project team will work with Technology/Software providers, especially Appsembler, our chosen SaaS (Software as a Service) provider of Open edX, to enter into a contractual agreement which ensures all personal information is handled in a privacy-compliant manner, wherever possible. Particularly, the third party's use of the personal information will be restricted to only tasks they are contractually obligated to complete and nothing more. In all cases we will advise users about a third party's privacy policies/terms should the user be directed to a third-party site for additional links or resources, as part of informed consent process.

The process

The project team shall refer to international, federal and provincial regulations regarding privacy to inform this PIA report. Specifically, this included The *International Conference on Data Protection and Privacy Commissioners* resolution and the Canadian *Privacy Act* and the *Personal Information Protection and Electronic Documents Act (PIPEDA)*. Finally, provincial regulations and best practices have been used to inform our project team's understanding include the;

- Smart Cities Finalist Guide and Resources including staff

- Planning for Success: Privacy Impact Assessment Guide
- De-identification Guidelines for Structured Data

Also, throughout this project, the project team will continue to assess the project's privacy risks and impact to determine if there is a need to update the privacy analysis and/or the PIA report. This ongoing assessment is an essential part of identifying and mitigating new issues and changes impacting privacy that may arise during the implementation phases.

Glossary

Please refer to Appendix A for a glossary of terms.

PROJECT

Project Objectives:

Our project seeks to achieve the following four (4) objectives to meet our Challenge Statement. The progress indicators also outlined in **Table 1** will be used to measure the ongoing success of the project.

Table 1: Objectives and Measurable Outcomes:

Objectives		Progress Indicator/Measurable Outcome
1.	Youth who are "better-educated"	• Increase in number of K-12 STEM courses successfully completed by K-12 students, • Decrease in percentage of K-12 students needing remedial help in STEM subject areas
2.	Youth who are "more-employable"	• Increase in number of K-12 STEM courses successfully completed by K-12 students, • Increase in number of K-12 students who have at least a basic ability to code
3.	Youth who are "better-grounded" in their Nishnaabe identity	• Increase in number of K-12 students who know the key concepts expressed in each of our core aadsookaanan • Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students
4.	Youth who are "more holistically Nishnaabe"	• Minimum 2,000 hours of Nishnaabe language acquired by graduating eighth-graders • Increased annual participation rate in number of traditional Nishnaabe activities for K-12 Students • Minimum 1,000 hours of Nishnaabe-language STEM video successfully completed by graduating high school seniors

Description of Project

To achieve our project goals the creation of an online, mobile-enabled platform will be required that is able to carry out the following three functions:

(1) **eLearning.** Mobile-enabled eLearning functionality built into the Open edX platform. This refers to all learning online not related to language acquisition.
(2) **eAcquistion.** Mobile-enabled eAcquisition - the functionality will be nearly identical to our eLearning functionality, but will have the added responsibility of enabling the effective acquisition of our Nishnaabe language. Specifically, this include hosting and administrating 2,000 hours of Nishnaabe-language immersion videos. As our community makes a strong distinction between language *learning* (a conscious, cognitive process) and language *acquisition* (which occurs subconsciously), we need to keep these two functionalities independent of each other so that each one's unique pedagogical approach can be implemented effectively.
(3) **Meetup Forum.** Mobile-enabled meetup forum functionality will serve as the central 'online gathering' place which will facilitate the bridging and interfacing of the digital world with the material, real world.

We have chosen the Open edX platform for our project. Open edX is an open source software and facilitates the production of materials to be made available under a Creative Commons license. Appsembler is our chosen SaaS (Software as a Service) provider of the Open edX platform.

Accountability

The Smart Cities project team is accountable for this project. Please see roles and responsibilities for additional information.

Related Initiatives and Linkages

It is important for the project team to have a solid understanding of existing and ongoing initiatives in the community that may influence this Smart Cities project. The project team has identified three (3) existing projects of particular importance which should be monitored as part of the project management process. Project leads from each of the below initiatives have also already been identified as key stakeholders in the Smart Cities process and will continue to be consulted over the course of the project's implementation phases, as outlined in our stakeholder management plan.

- **Language Project:** ongoing project to capture and preserve the Nishnaabe language, specifically the Biigtigong dialect.
- **Curriculum Development:** ongoing project to update the school curriculum to emphasize cultural and land-based learning activities for K-8 students.
- **New School Project** Biigtigong Nishnaabeg is currently in the process of designing a new elementary school and Business Training and Education Complex. These facilities can be used to promote this program and facilitate participation by youth and young professionals. By having this easy access to the target audience this will ensure that the program is adopted.

PRIVACY

Participation and Consent

In order to ensure participants (and their legal guardians) make an informed decision when providing their consent to participate in the Open edX platform, a privacy seminar will be held at the community centre prior to program roll out. During this seminar, the project team will review the project and the content of this Privacy Impact Assessment to ensure participants (and their guardians) are knowledgeable of the inherent risks of participating in a partially-online learning platform. This seminar will overview what information will be collected and why, who will have access to this information once an account has been created and what agreements are in place (at that time) with all 3rd party providers. This seminar will also allow community members to voice their privacy concerns with respect to participating in an online environment. The project team will also present the policies and procedures developed thus far to mitigate any identified privacy risks and how any data breaches will be managed, as described within this document and further iterations of the PIA.

Should students, or their legal guardians, opt-out of the online-augmented (i.e., blended-learning) program, they will be given alternative means of participating in the K-12 curriculum at the brick-and-mortar school. It is important to note the participation in this Open edX platform is 100% voluntary and if not adopted will not diminish the learning of non-participants. Participants and their guardians will be provided a consent form outlining the privacy concerns and risks, for review and signature prior to enrolling in the Open edX platform.

Personal Information

Users of the Open edX platform will be required to provide the following types of personal information. This information will then be use by teaching Staff to offer better service to participants.

- Account creation and login information, including user name and password *
- Location information - anytime the student interacts with Open edX platform, location data is generated **
- Patterns of behaviour (which educational videos were watched and for how long)

*Students will not be asked to provide their address, date of birth nor other identifying information for the purposes of setting up an account with Open edX. The intent of collecting a user name and password is only to allow a student to create an account and login to the Open edX platform and to enable teachers to track a student's progress.

**Due to the very nature of the internet, anytime a person connects to the internet, the media that is being delivered to that person is trackable using a particular 'IP address.' Location data can then be deduced from that IP address. There is no reasonable (or perhaps possible) way to interact with the internet without generating location data. Total location privacy is not possible within the current organization of the internet since IP addressing is a foundational part of the internet. As such we can only attempt to maximize our privacy online - while accepting that our location will always be exposed to some degree.

The Open edX platform will be owned and operated by the Biigtigong Nishnaabeg Smart Cities project team, lead by Chief and Council. Students (via their guardians) will consent to voluntarily provide their name, user name, and password in order to create an account on the Open edX platform. Information to

be collected will include the name/user name of the student and the amount of time a student spends watching a video, as well as any participation in any traditional activities as tracked through the meetup forum functionality. Similarly, should students identify participation in traditional activities through the meetup forum functionality of Open edX, this will generate location data. Again, providing this information is voluntary and students will be given alternative means of participating and reporting involvement in real world opportunities outside of Open edX, if necessary.

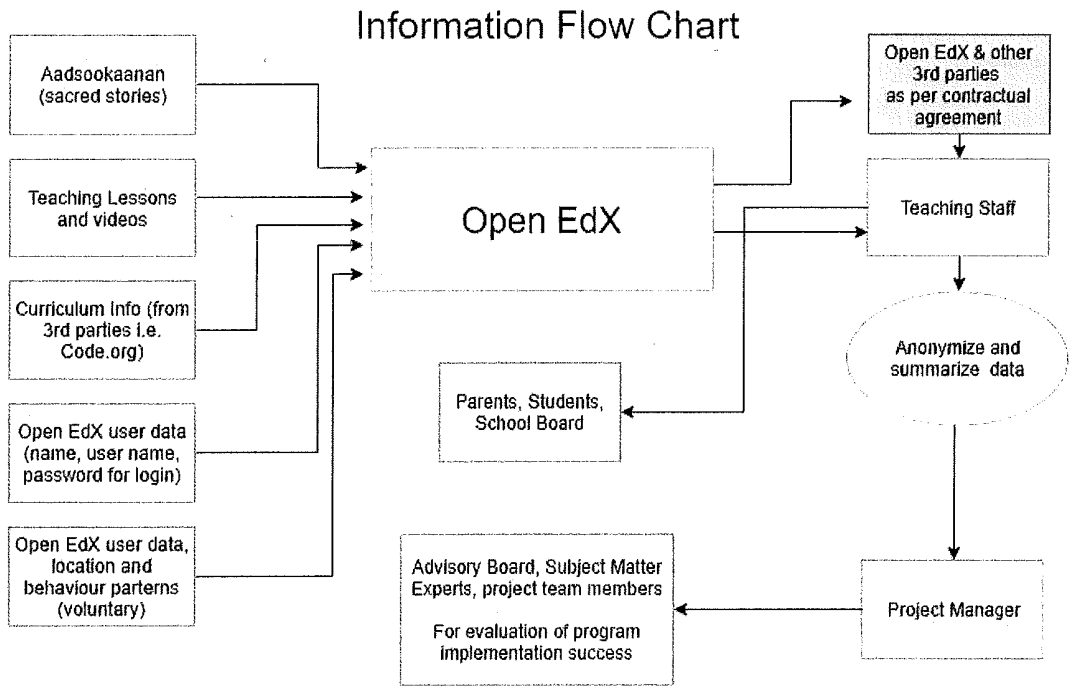
The purpose of teachers collecting the aforementioned information is to ensure a student has completed the required curriculum. Teachers will not provide information about a student to Open edX nor to Appsembler. The flow of information is from student to Open edX to teacher, which is then provided back to the student in the form of a report card and to the project team in the form of aggregated summary data for performance measurement tracking only.

This student-specific information will only be accessible by the teaching staff. No other project team member will have access to individual student specific information. No information will be made public.

Legal Authority

The legal authority for this project rests with the regulations and polices of Biigtigong Nishnaabeg First Nation as well as FIPPA and related agreements with partners, agents and other third parties.

Roles & Responsibilities



Role	Participant(s)	Responsibilities
Project Sponsor	Chief & Council	• Represent community • Provide project oversight and guidance as needed • Review/approve some project elements • Approve PIA
Subject Matter Experts	• Language consultant • Elders • Industry Partners • Teachers	• Provide language expertise data • Provide cultural expertise data • Provide Curriculum Expertise data (STEM) • Participate in PIA process (ongoing)
Advisory Committee	Community and Industry Leaders	• Approve major funding and resource allocation strategies • Authorize significant changes • Resolve conflicts and issues • Provide clear direction to the Project Manager • Review project deliverables and milestones • Identify risks and mitigation strategies • Participate in PIA process (ongoing)
Project Manager	Band Administration	• Manage project in accordance to the project plan • Coordinate with Advisory Committee • Supervise consultants and SMEs • Provide overall project direction • Direct/lead team members toward project objectives • Handle problem resolution • Manage the project budget • Participate in PIA process (ongoing)

Role	Participant(s)	Responsibilities
Project Participants, incl. technical staff and admin support	• Elders • Teachers • Language consultant • Video production team • Others to be identified by SC project Advisory committee	• Communicate project goals, status and progress to other participants, and project manager • Review and approve project deliverables and be held accountable for milestones • Create or help in creating work products (videos, written materials, curriculum). • Coordinate participation of individuals, teams and stakeholders • Evaluate outcomes and provide input on key performance indicators • Helps identify and mitigate project risks • Assure quality of products that will meet the project goals and objectives • Achieve milestones on time and on schedule • Participate in PIA process (ongoing)
Project Partners and Stakeholders	• Community • Industry • Technology/softw are providers	• Direct participation form community members who wish to provide opportunities traditional learning activities. • Indirect participation form industry and technology providers such as code.org, who we will engage for software and resources, but will have no direct involvement in the project. Community and industry partners and stakeholders will not collect, use or disclose any personal information. The project team will work with Technology/Software providers, including Open edX to enter into a contractual agreement which will ensure personal information is handled in a privacy-compliant manner, and restricts the third party's use of personal information for proposes outside the project scope. In all cases we will advise users about a third party's privacy policies/statements if the user is being directed to a third-party site for additional links or resources, as part of informed consent process.
Regulating Agencies	• Government of Canada • Government of Ontario	• Approval of PIA

BUSINESS PROCESSES AND INFORMATION FLOWS

The purpose of this section is to:

- Identify relevant businesses processes - both existing and planned - including changes to existing processes,
- Outline the key roles and responsibilities of the project team and the use of technology related to those business processes,
- Describe how personal information will flow through the business processes and technology,
- Describe how personal information will be collected, used, retained, disclosed, secured and disposed of, including changes to existing information flows, amounts or types of personal information involved and who will have access to the personal information and be responsible for it throughout its lifecycle

With respect to information flows, the following information will be provided to Open edX.

- Aadsookaanan
- Teaching Lessons and videos
- Curriculum
- Student name, user name, password (for access)
- Behaviour and location data (voluntary)

No additional information will be provided regarding the student's performance in other school programs. Again, this is a voluntary blended-learning environment (online and/or brick-and-mortar, but not online only) and therefore the intent is to not replace what is currently being done at the school level. All collection of student data will be limited to what is needed for educational purposes.

Teachers are the only project team members who can then access the student specific data. Behaviour data is required to make teachers being aware of how long a student struggled with a particular math problem, or how many times the student rewatched a video, and which sections of the video were rewatched, for example. This is one of the main benefits of using a blended-learning approach as this "behavioural pattern" data is what helps our teachers teach more effectively.

Teachers will then summarize the data and submit to the project team for performance monitoring and process improvements. Information collected by 3rd parties will be as per the contractual agreement. All terms of these agreements and risks to privacy resulting form 3rd party platforms and software will be communicated to users (and guardians) as part of the informed consent process.

PRIVACY ANALYSIS

The following table summarizes the results of our privacy analysis:

Process Statement	Process and Compliance measures
Purpose of the collection of personal information	This project involves creating a blended learning environment with both online and real-world components. The nature of an online learning environment results in the collection of minimal personal information to create an account, name, user name and password. Additionally, certain functionalities of the Open edX platform, such as the meetup application or time spent watching videos, will also generate data on a user's location and behavior patterns. Another source of data is the videos, stories, overdubbing etc. that will be created for the language immersion education and STEM bilingual courses portion of the project. This data will be stored on the Open edX platform as well as in a redundant hard-copy format (i.e., transcripts, tapes, etc.) to ensure data is not lost. There are no additional privacy concerns associated with storing physical copies of the educational materials. All information identified is absolutely necessary for participating in the project and/or for monitoring the success of the project
Source of personal information/ Accuracy	Data will be collected directly by users to generate their profile and then tracked using their Open edX account. For example, it will be necessary to track users time spent watching video to provide assurance that the student has completed the necessary videos for completing the curriculum requirements. Given that the curriculum will be developed in a blended learning environment (brick and mortar and online) this will only include the collection of data related to activities completed in the Open edX platform. Activities completed within the brick and mortar school will continue to be tracked by teaching staff under existing processes.

	Qualitative data will also be collected by teachers for users to inform feedback on the project, monitoring, evaluation and control purposes. Personal information will be collected directly from the Open edX platform. Collection of data from teaching staff will be required and is appropriate given the context of this project Given that information is provided directly by the user through the online platform, we do not anticipate any major inaccuracies. Likewise, the anonymized and summarized data to be provided by teaching staff is subject to their current process which ensure accuracy and privacy of student information.
Accountability and Openness	The project team is accountable for the data collection, management and safeguarding results from this project. The project team has intentionally minimized the amount of personal information to be collected through use of Open edX platform, as users will only need to provide their name, user name and password to create an account. Likewise, we will implement a process that enables students and their legal guardians to provide informed consent to participate in this voluntary process, thus ensuring they understand what information will be collected, why, and who will have access to it.
Manner of collection of personal information	The data to be collected is minimal and relatively not intrusive. It is similar (if not identical) to the information already being collected and managed by the school system. Similarly, the information collected via the Open edX platform is typical for any online platform. Use of the meet up application is voluntary, and any users will be provided a privacy statement to agree to prior to using this forum (i.e. authorizing sharing of user location data)
Limiting Use, disclosure and Retention	Teaching staff are already subject to policies and codes of conduct that govern how they treat personal information, through to physical or technical controls that protect the information. Safeguards that will be into place include physical security; IT security; staff training; policies, confidentiality clauses in contracts with external providers etc. Information, such as language videos, transcripts etc. are to be stored indefinitely as these are important records of our language and traditional teaching that we are attempting to preserve as part of this project. Personal information will only be used for the purpose it was collected for, and as described in this PIA. The personal information collected for the students will only be retained until graduation. Following successful graduation, all student data will be removed from the server and student accounts will be disabled. The collection, use, retention and disclosure of personal data, and particularly student data, should always be limited to what is necessary to fulfil authorized

	purposes. Reducing the risk posed by the excessive collection of student data is a core principle that guides this project's data processing practices.
Access and correction to personal information	Users will be able to access the account information on the Open edX platform. Information collected by teachers will be subject to the policies and procedures currently in place in the school system. Information will be shared with students and parents through existing channels (i.e. report cards). Access logs will be implanted to track access to personal information. Teachers can correct their existing report card writing process based on information collected. For example, should a student choose not to use the meet up forum, the teacher would not reflect the true involvement in traditional activities in that student's grade. Requests for personal information to be corrected will be handled on a case by case basis. However, we do not anticipate any major concerns with meeting this principle as all information collected is basic in nature and expect most changes, if any would be minor in nature such as their name, username or password changes.
Accuracy etc. of personal information	Given that information is provided directly and automatically by the user through the online platform, we do not anticipate any major inaccuracies. Likewise, the anonymized and summarized data to be provided by teaching staff is subject to their current process which ensure accuracy and privacy of student information. The process for anonymizing the data will involve the teaching staff providing the project team a summary report detailing quantitative data needed to provide details needed to track and report on performance indicators. This will include: • number of K-12 STEM courses successfully completed by K-12 students • number K-12 students needing remedial help in STEM subject areas • number of K-12 students who know the key concepts expressed in each of our core aadsookaanan • participation rate in number of traditional Nishnaabe activities for K-12 Students No personal or identifying information will be shared, nor will it be required, by the project team. The summarized data, omitting all personal information, is required by the project team to track, monitor and evaluate the implementation of the project, and to make course corrections when necessary. Qualitative data will also be collected for teachers to provide feedback on the project, for monitoring, evaluation and control purposes.
Data Disposal	Data stored on the Open edX platform will be expunged following a student's graduation.

Risk to Privacy Risk Strategy

Measures will be implemented to minimize risk as previously described. This includes policies for information flow, storage requirements, anonymized user names and a consent/privacy statement for users of Open edX as previously described.

Breach of Privacy Policy

The project team will develop and implement a breach response policy and protocol that addresses privacy and security risks for both the online and offline platform/storage methods.
Information custodians, namely Teaching staff, Chief and council, and the database administrator must immediately contact the to be named Privacy Officer, informing him or her of the following:

1. the nature of the breach;
2. the information that was exposed;
3. to whom it was exposed; and
4. for how long it was exposed.

The Information Custodian will work with the Privacy Officer who will advise whether notice to affected individuals and the Office of the Information and Privacy Commissioner of Ontario (IPC) is required. If such notice required, the Privacy Officer will work with the information custodian to meet the needs of the IPC.

Conclusions and next steps

The project team has completed the initial Preliminary PIA process. As the project is implemented the project team shall continue to:

- Refer to the International Conference on Data Protection and Privacy Commissioners resolution on eLearning Platforms in proceeding with our PIA
- monitor progress of privacy-related activities to make sure they are appropriately completed,
- assess any changes to the project's implementation, information flows, roles and responsibilities, to ensure that new privacy risks have not been created by these changes,
- evaluate mitigation measures to determine if they are effective when implemented; update or revise, if necessary,
- identify and assess new, outstanding and remaining privacy gaps and impact, and identify new action items required to address privacy risks,
    - alert the project lead and relevant decision-makers to any new privacy related problems, and obtain appropriate approvals to address or accept the privacy risks and
    - update or supplement the PIA documentation, as required, ensuring documentation of any newly identified privacy risks and impacts and how they arose, their likelihood, harm and priority for action and mitigation strategy to address the new privacy risks. The project lead and other appropriate decision-makers will approve all significant changes impacting privacy and the acceptance of any privacy risks.

ATIA - 19(1)

parkland county

Dear Infrastructure Canada,

We have created our first draft of the requested PIA and submitted it to the office of Leroy Brower, Assistant Information and Privacy Commissioner, at the Office of the Information and Privacy Commissioner of Alberta. Please find attached our PIA as well as the Commissioners feedback.

If awarded the Smart Cities Challenge prize we have already been in contact with Cenera (https://cenera.ca/) to discuss completing the final PIA using our first draft and the feedback from the Commissioner's office. We are cognizant that as the project develops there will be additional privacy developments that will need to be addressed. We are committed to working with our Provincial Privacy Commissioners office through every stage of the project to assure we are meeting all standards and expectations.

Re: Parkland County Smart Cities Preliminary PIA

Dear Ms. Scully:

I am writing in response to your preliminary privacy impact assessment (PIA) on the Parkland County's Smart Cities project (the project), which our office received on February 5, 2018. Congratulations for being a finalist in this important competition.

We have completed our initial review of the preliminary PIA. Our comments focus on the Finalist Guide, Appendix 3 requirements, which are:

- Description of personal information or personal health information to the collected, used or disclosed (CUD);
- Information flow map that outlines each CUD of personal information or health information, with a corresponding legal authority table for each flow;
- Description of who you will collect personal information or health information from to enable the project with assessment of that person's authority to disclose the information;
- Information governance plan;
- Organizational privacy management framework, including related organizational access, correction, privacy and security policies; and
- A plan that outlines the way in which you will consider privacy and security risks throughout the process including to complete a comprehensive PIA.

Comments

- The PIA provides an information flow map, but no corresponding legal authority table for each flow was provided. Please provide a legal authority table.

- An organizational privacy management framework is required, but has not been provided. Please provide our office with an organizational privacy management framework, including related organizational access, correction, privacy and security policies. I've provided a link below to organizational privacy management framework guidance issued by our office.
  - https://www.oipc.ab.ca/media/383671/guide_getting_accountability_with_privacy_program_apr2012.pdf

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- The Finalist Guide requires a plan that outlines the way in which you will consider privacy and security risks throughout the project, including completing a comprehensive PIA. Please provide a plan that outlines the steps that will be taken as the project proceeds to ensure proper consideration of privacy risks, which eventually will conclude with completion and submission of a final PIA.

- Page 4 of the PIA references the City of Red Deer's Privacy Statement and Conditions of Use Policy and Strathcona County's Privacy and Security Statement. Please explain the reference and possible use of other municipality's policies.

- The list of personal information to be collected includes age, gender and marital status. A general statement is made that all information being collected is necessary to operate the open date portal and for research and development, but no further explanation is provided. Please clarify why each of these data elements must be collected in order to operate the program, and explain how collection is limited to only what is necessary in order to meet the purpose.

- Is the personal information to be collected linked or matched with any other information? If so, please outline this information and the steps taken to link and match it.

- There is indication in the PIA that data input is what "users opt to supply". Please elaborate on a user's ability to control what data they choose to make available. For example, can a user choose to not provide their marital status?

- Page 11 says that one of the projects mandates is to attract research and development. We note that the notice statement provided does not adequately inform a user that the information they provide will be used for this purpose. Please provide our office with a modified notice statement.

- Part 8 of the PIA addresses possible disclosures and says the information collected will only be disclosed for the purpose of research. We do not think this is accurate. For example, if Parkland County received a subpoena for information held within the portal, or received an access request for information held within the portal, it seems unlikely the information would not be processed and considered for disclosure. Please review the possible disclosures that may be necessary and revise this section, as well as consider necessary revisions to the notice statement.

- The information flow provided includes presenting a user with a research policy that they can agree to or not agree to. We are pleased to see user control included. However, we note that user control occurs after personal information has already been collected. Providing this notice and user control prior to collection would enhance privacy and reduce risk. Please provide rationale to support including user control at this stage of the information flow.

- As noted previously, a mandate of the project is research. The PIA indicates that research will comply with section 42 of the FOIP Act. Has the head of Parkland County approved conditions relating to security and confidentiality and the other factors listed in section 42(c)? If so, please provide them to our office.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

These are all of our questions or comments at this time. In summary, along with some areas of clarification, there are two key issues that we discovered in our review that we feel are important to address:

1. An organizational privacy management framework and related organizational policies is required, but has not been provided; and
2. It appears at this point that privacy and security assessment for the web-based tool/portal has not been completed and there is therefore no related privacy risk assessment and mitigating safeguards that have been outlined. This makes the plan that outlines the way in which you will consider privacy and security risks throughout the project, including completing a comprehensive PIA, a very critical component of our review, and ultimately, success in ensuring privacy issues are reasonably addressed. Please provide our office with a detailed plan that outlines the steps, and a timeframe for each step, in which privacy and security risks related to this project will be considered.

We request that you provide us with responses to our questions and comments on or before March 5th, and a copy of your final preliminary PIA that is submitted to Infrastructure Canada. Should your response identify a gap, please provide a plan that outlines how that gap will be addressed.

We will be providing Infrastructure Canada with comments based on the information you provide to us on or before March 5th.

We will complete a further comprehensive review of the final PIA should this project proceed.

Please contact Ms. Kreutzer-Work or me if you have any questions.

Sincerely,

[redacted]

LeRoy Brower
Assistant Commissioner

SMART CITIES CHALLENGE, VIRTUAL AG LAB
Preliminary Privacy Impact Assessment (PPIA)

Submitted: February 5, 2019

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Privacy Impact Assessment (PIA) Questionnaire to assess the protection of privacy in accordance with Part 2 of the *Freedom of Information and Protection of Privacy Act* (FOIP Act)
PIA: Smart Cities Challenge – Virtual Ag. Lab.

Part 1: Basic Information

1.1 Provide Program Area Identifiers.

Public Body	**Parkland County**
Division (if applicable)	**Strategic Initiative Division**
Dept. or Service Area	**Smart Parkland**
PIA Title	**Smart Cities Challenge - Virtual Ag Lab**
PIA File Number	**PIA 2019-01 SP**

1.2 Provide Program Area Contact Information.

This should be the name of the individual able to respond to questions regarding the PIA or the contact information of the position able to respond in future.

Name	Barb Scully		
Title	Connected Communities Program Manager		
Dept. or Service Area	Smart Parkland		
E-Mail	[redacted]@parklandcounty.com	Phone	780-968-8888 ext [redacted]

1.3 Description of the Initiative/Program/Application/System ("Initiative") under assessment:

In April 2018 Parkland County submitted an application for the Smart Cities Challenge in partnership with the other three municipalities. In June 2018 it was announced that our application had made the finalist round and the award was $250,000 to create a more comprehensive plan. The initial application was asked to provide a challenge statement for your community and ours is as follows:

"Our agricultural community will revitalize and grow through the connection of people to the land and food while attracting citizens to share in its prosperous, innovative and resilient way of life."

In fall 2018 five RFP's were created and sent by invitation to 3 vendors per RFP. The areas that are being looked for are in alignment with the response to Question 9 on the original application.

- **The design specifications of the AG Innovation Living Lab – We will work with external experts, and volunteer advisors to design the Living Lab and specify how it will be operated. Particular attention will be paid to specifying the Smart Community benefits that will be achieved by users of the Living Lab once it is functional. Program elements and technology support systems will be specified and, to some extent, prototype testing will be undertaken – both to determine what is feasible as well as to begin to build internal capacity to support the Living Lab into ongoing implementation. We will also conduct a research program to understand the emerging state of the art technologies that are available to support this concept. Anticipated budget $50,000**
- **A community developed Strategic Plan – We will engage Integral Strategy Network to deliver their proprietary collaborative Integral Strategy Roadmap process with us and our community stakeholders. This will deliver a complete action / implementation plan and will**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

create sustainable community capacity to carry this work forward into future years. Anticipated budget $100,000

- A series of 7 Smart Community events – We will plan and host 4 events to enhance community engagement efforts that we have accomplished to date. These will further spread the knowledge of what it means to be a Smart Community and further engage residents and businesses to continue to seek their input into the above noted Strategy and Living Lab specifications. It will continue to build widespread understanding of what will be possible as our Smart Community plans are implemented. Anticipated budget $40,000

- An infrastructure capacity / capability assessment – we will sub-contract external experts to undertake a complete review and gap assessment of the installed infrastructure in all participating Counties. This also will include a phased approach to resolve the gaps and make recommendations regarding core technology choices to deliver equitable internet/cellular access for all residents and businesses in the region. Anticipated budget $60,000

All of these activities will provide the background, community collaboration and plans necessary to develop our final proposal for submission for the overall Smart Community prize. We have a 1 in 5 chance of winning $10 million dollars to see the project through over 2-5 years.

The Strategic Plan was divided into two RFP's. A Sustainability Plan for the project and the coordinating and writing of the Final Application.

The awarding of the RFP's will create a team to coordinate, gather data, complete community and stakeholder engagement and build a final winning submission.

The submission is due March 5, 2019 and must include (as per the Infrastructure Canada Finalist Guide):

1.4 Purpose/Objective of the Initiative:

The goal of the Parkland County, Lac Ste. Anne, Yellowhead and Brazeau County initiative is based on our Challenge Statement:

"Our agricultural community will revitalize and grow through the connection of people to the land and food while attracting citizens to share in its prosperous, innovative and resilient way of life."

Our proposed initiative is a web based tool that houses a variety of applications under one umbrella to streamline the access to tools and services that deliver a solutions driven application. It will give assistance in the areas of succession planning, food security, rural safety, local economy and research and development to name a few. It will help forge connections locally for those involved in the agricultural sector as well as drive global connections to increase community economic development and innovation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Communities lead the way

The Smart Cities Challenge is a competition open to all municipalities, local or regional governments, and Indigenous communities (First Nations, Inuit, and Métis) across Canada.

This Challenge will empower communities across the country to address local issues their residents face through new partnerships, using a smart cities approach.

A smart cities approach means achieving meaningful outcomes for residents through the use of data and connected technology. This approach can be adopted by any community, big or small.

Finalists will receive support to develop their smart cities proposals. Winning communities will be awarded with prize money to help implement them.

Census websites included. Why?

Any attachment to the PIA should be included as Appendices. Please include a List of Appendices.

Appendices:

1. **Infrastructure Canada Original Proposal (Final application to be completed March 5th)**
2. **Hyperlink to City of Red Deer's Privacy Statement and Conditions of Use Policy and Strathcona County's Privacy and Security Statement**
3. **Information Sharing Agreement Templates**

Freedom of Information Protection of Privacy Act

1.5 Does the Initiative collect, use or disclose personal information as defined in section 1(n) of the FOIP Act[1]? **YES**

For example, are you implementing a collection of personal information that was not previously done? Are you changing the way you collect personal information in an existing Initiative in any way? Are you expanding the scope of the Initiative so more people may be affected? Are other agencies participating in the exchange of personal information under this Initiative? These are the types of questions to consider.

If the answer is YES, or if you are uncertain, continue this assessment.
If the answer is No, there is nothing further required; go to *Signatures* under Part 12 of this assessment.

1.6 List of personal information data elements being collected, used or disclosed under this Initiative.

The list of elements being collected, used or disclosed are:

-the individual's name, email, home or business address or home or business telephone number.

-the individual's age, gender, marital status or family status.

[1] Under section 1(n) of the FOIP Act, personal information is defined as "recorded information about an identifiable individual".

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

-the individual's personal views or opinions.

The information collected will only be used to assist the Ag Lab to function as an open data portal for research and development. The collection of open data also supports the site in its goals to offer the best supports for users; residents, producers, nonprofits, value added agriculture sector, post-secondary and the research and development industry. Without the collection of information we are unable to collect enough data to understand user needs. A vital component of this project is to create a user driven virtual toolbox with a focus on the agriculture sector. In order to maintain the integrity if built, we must have the data and input that the users opt to supply. This information will help form the flow of information and services based on user needs and trends. The information and opportunity of open data will also drive solutions, innovation and educational opportunities for the users

1.7 Has any previous personal information privacy or security assessment been done for this Initiative or a related initiative?

Please list for cross-reference any related PIAs, Security Threat and Risk Assessments (STRAs) or other assessments previously completed or concurrently being undertaken.

Remember to include any attachments referenced in the PIA as Appendices.

NO

To date there have been no prior PIA's completed or performed on the potential Virtual Ag Lab.

Table of Legal Authority not included in flow chart

1.8 Provide a flowchart illustrating the information flows, i.e. the collection, storage movement, use and disclosure of all personal information.

This can be a block and arrow diagram. Make it as simple and as clear as possible.

The purpose of the flowchart is simply to identify where, how and to whom personal information is moving under this Initiative in order to aid identification of legislative authorities at each point of exchange.

Please include below or as an attachment. **Included with appendices**

Part 2: Collection (section 33)

Is this Initiative collecting personal information? **YES**

If the answer is YES, continue under this part of the assessment.
If the answer is No, go to *Use* under Part 5 of this assessment.

There are three authorities for a public body to collect personal information under the FOIP Act. Please think about all personal information data elements collected. The collection of some personal information data elements may have a different authority

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

than other personal information data elements and we must identify every authority that applies. Check all that apply.

☐ The collection of the personal information is expressly authorized by an enactment of Alberta or Canada. [s. 33(a)] *If yes, provide the legislative authority: [Name and section of Act]*

☐ The collection of the personal information is for law enforcement. [s. 33(b)]

Note: law enforcement is defined under section 1(h) of the FOIP Act. In order to apply this authority, please review this definition and Bulletin No. 7: Law Enforcement found at: http://www.servicealberta.gov.ab.ca/foip/resources/bulletins.cfm

☒ The collection of the personal information is directly related to and necessary for an operating program or activity of the public body. [s. 33(c)]

Without the collection of the personal information; such as opinions, marital status and contact information, the Ag Lab cannot function as an open data portal for research and development. The collection of open data also supports the site in its goals to offer the best supports for users; residents, producers, nonprofits, value added agriculture sector, post-secondary and the research and development industry. Without the collection of information we are unable to collect enough data to understand user needs. A vital component of this project is to create a user driven virtual toolbox with a focus on the agriculture sector. In order to maintain the integrity if built, we must have the data and input that the users opt to supply. This information will help form the flow of information and services based on user needs and trends. The information and opportunity of open data will also drive solutions, innovation and educational opportunities for the users in areas such as collaborative projects with producers and post-secondary partners to work on real time solutions for the agriculture industry, matching research and development with value added agriculture businesses to create economic opportunity in the region and peer to peer mentorship leading to succession planning opportunities.

If you have checked any of these three authorities above for collection, you have identified an authority under the FOIP Act that allows the Initiative to collect the personal information. Please continue the assessment.
If the answer is No to all three of these authorities above, you have not identified an authority under the FOIP Act that allows the Initiative to collect the personal information. Is the Initiative collecting personal information? **Please contact your FOIP Coordinator for assistance (ext. 3229).**

Part 3: Direct/Indirect Collection (section 34)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Personal information must be collected directly from the individual unless an exception to this requirement applies.

Is the Initiative only collecting personal information directly from the individual the information is about? **YES**

If the answer is Yes, go to *Notification* under Part 4 of this assessment.
If the answer is No and you are planning to collect any personal information indirectly, continue under this part of the assessment.

Please indicate whether any of the following statements are true. Please ensure indirect personal information flows are indicated on the preceding flowchart and be prepared to provide additional supporting information. Check all that apply.

☐ The individual authorized (consented to) another method of collection. [s.34(1)(a)(i)] *If yes, please explain how authorization is obtained:*

☐ Another Act or regulation authorizes the indirect collection. [s. 34(1)(a)(ii)] *If yes, provide the legislative authority: [Name and section of Act]*

☐ The Information and Privacy Commissioner has authorized the indirect collection. [s. 34(1)(a)(iii) with s. 53(1)(h)] *If yes, please provide any details in relation to the Commissioner's authorization such as expiry, conditions, etc:*

☐ The information is disclosed to the public body under the FOIP Act. [s. 34(1)(b)] *If yes, please provide the section of FOIP Act under which the personal information is disclosed to the public body:*

☐ The information is collected in a health or safety emergency and direct collection is not possible or is unsafe. [s. 34(1)(c)]

☐ The collection is from a designated emergency contact or contact for other specified circumstances. [s. 34(1)(d)]

☐ The indirect collection is for the purpose of determining suitability for an honor or award. [s. 34(1)(e)]

☐ The collection is from published or public sources for the purpose of fund raising. [s. 34(1)(f)]

☐ The indirect collection is for the purpose of law enforcement. [s. 34(1)(g)]

Note: law enforcement is defined under section 1(h) of the FOIP Act. In order to apply this authority, please review this definition and Bulletin No. 7: Law Enforcement found at: http://www.servicealberta.gov.ab.ca/foip/resources/bulletins.cfm

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

☐ The indirect collection is for the purpose of collecting a debt or fine owed to the public body. [s. 34(1)(h)]

☐ The indirect collection concerns the history, release or supervision of an individual under the control or supervision of a correctional authority. [s. 34(1)(i)]

☐ The indirect collection is for use in the provision of legal services to the Government of Alberta or a public body. [s. 34(1)(j)]

☐ The indirect collection is necessary to determine eligibility for participation in a program or to receive a benefit, product or service from the public body and occurs in the course or processing an application. [s. 34(1)(k)(i)]

☐ The indirect collection is necessary to verify eligibility for participation in a program or current receipt of a benefit, product or service from the public body and the information was collected for that purpose. [s. 34(1)(k)(ii)]

☐ The indirect collection is for the purpose of informing the Public Trustee or a Public Guardian about clients or potential clients. [s. 34(1)(l)]

☐ The indirect collection is for the purpose of enforcing a maintenance order under the *Maintenance Enforcement Act*. [s. 34(1)(m)]

☐ The indirect collection is for the purpose of managing or administering personnel of the public body. [s. 34(1)(n)]

☐ The indirect collection is for the purpose of assisting in researching or validating the claims, disputes or grievances of aboriginal people. [s. 34(1)(o)]

If you have checked one of the preceding authorities for indirect collection, you have identified an authority under the FOIP Act to collect the personal information from another source rather than directly from the individual(s) themselves. **Notification is not required: skip to *Use* under Part 5 of this assessment.**
If none of these indirect collection authorities is selected, you must collect the personal information directly from the individual the information is about or identify options that meet one or more of these authorities. Please contact your FOIP Coordinator for assistance (ext. 3229)

Part 4: Notification (section 34)

*Notification is required when personal information is collected directly from an individual. This part of the assessment is completed when you are collecting information directly from individuals. Notification contains **three** elements:*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

i) Purpose of collection – This must be specific enough so a reasonable person can understand the purpose for which their personal information is collected including how it may be used and/or disclosed.

ii) Specific legal authority for collection – This should include any enabling legislation and/or the applicable FOIP Act authority.

iii) Job Title, business address and business telephone number of an officer or employee of the public body who can answer questions about the collection.

Does the notification provided to the individual at the time personal information is collected under this Initiative include the three elements listed above? [s. 34(2)] **Yes**

A disclaimer sentence below will be included at the time of collection and present at the beginning of any web area that is asking participants to opt in to information sharing.

not necessarily "research + development"

The personal information you provide will be used for the purpose of compiling and analyzing the data and linking the information to a geospatial map. This information is collected in accordance with Section 33 (c) of the Freedom of Information and Protection of Privacy (FOIP) Act. We collect only what is necessary for the operation of the open data portal. The information is used only for the purpose it was collected or for a consistent purpose. Further, we keep the information only for the length of time necessary to fulfill the purpose for which it was collected.
If you have any questions about the collection and use of this information, please contact the FOIP Coordinator at Parkland County, 53109A HWY 779, Parkland County, Alberta T7Z 1R1 (780-968-3229) or email foip@parklandcounty.com

NOTE: The current uses being examined are outlined in section 1.4 and section 2.0 of this document. Upon being awarded the Infrastructure Canada prize we would be first solidifying our plan of content and information flow. At that time a full privacy impact assessment will be completed to ensure it aligns with the FOIP Act. At the time of the creation of this assessment we have listed the current uses of information.

Part 5: Use (section 39)

Is the Initiative using personal information? **YES**

If the answer is YES, continue under this part of the assessment.
If the answer is No, go to *Disclosure* beginning at Part 6 of this assessment.

There are three use authorities for personal information under the FOIP Act. Please think about all personal information data elements involved; the use of some personal

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

information data elements may have a different authority than other personal information data elements. Check all that apply.

☒ The personal information is being used under this Initiative according to the original purpose for which it was collected or compiled or for a use that is consistent with that original purpose of collection. [s. 39(1)(a)]

If the above is selected and the use includes consistent purposes, please confirm the consistent use meets both of the following:

☒ The consistent use has a reasonable and direct connection to the purpose for which the personal information was originally collected or compiled.

AND

☒ The consistent use is necessary for performing the statutory duties of or operating a legally authorized program of the public body using the personal information.

Provide details/explanation: **As stated in the description of the project the collection of personal information from our residents will support our goals in creating a user driven platform to provide the best information, resources and opportunities to the agricultural users.**

☒ The individual has identified the information and consented to the use. [s. 39(1)(b)]

We will create a privacy statement and conditions of use policy for the open data portal. See Appendices for examples.

☒ The use is for a purpose for which the information was disclosed to the public body under section 40, 42 or 43 of the FOIP Act. [s. 39(1)(c)]

If the above is selected and another public body is disclosing personal information to this Initiative under a FOIP Act disclosure authority (sections 40, 42 or 43), this is the corresponding authority for the Initiative's use of the information.

If this Initiative receives and uses personal information disclosed from another public body and you are uncertain it is being disclosed under the FOIP Act, you may wish to return to this question after reviewing the authorities in ***Disclosure*** *beginning at Part 6 of this assessment and in consultation with the other public body.*

If you have checked one of the preceding authorities for use, you have identified an authority under the FOIP Act that allows the Initiative to use the personal information. Please continue the assessment.
If none of these use authorities is selected, you have not identified an authority under the FOIP Act that allows the Initiative to use the personal information. **Please contact your FOIP Coordinator for assistance (ext. 3229).**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Part 6: Disclosure for Research or Statistical Purposes (section 42)

Has a researcher requested records that contain personal information as part of this initiative? **YES**

If the answer is YES, then all the conditions under section 42 of the FOIP Act must be met including signing an agreement to comply with the approved conditions. **Please contact your FOIP Coordinator for assistance (ext. 3229).**
If the answer is YES, and this is the only disclosure, go to *Accuracy and Retention* under Part 9 of this assessment.
If the answer is YES, and there may be additional disclosure authorities, or if the answer is NO, go to *Disclosure of Information in Archives* under Part 7 of this assessment.

One of the projects mandates is to attract research and development both to the virtual space as well as the physical region. Upon the development of the project, if awarded, disclosure and permissions policies will be formed in compliance with the FOIP act and under the direction of the FOIP Coordinator. It will be created to meet all conditions under section 42 of the FOIP act. Any information collected will be on an "opt in" bases from participants and we will collect only the minimal information needed to achieve our purpose.

Part 7: Disclosure of Information in Archives (section 43)

The Provincial Archives of Alberta and the archives of a public body may disclose information as authorized by section 43 of the FOIP Act.

Is the disclosure of personal or other information held in an archives part of this Initiative? **NO**

If the answer is YES, continue under this part of the assessment.
If the answer is NO, go to *Disclosure of Personal Information* under Part 8 of this assessment.

☐ Has the record been in existence for 25 years or more and the disclosure would not be an unreasonable invasion of privacy under section 17 of the FOIP Act? [s. 43(1)(a)(i)(A) with s. 17]

☐ Has the record been in existence for 25 years or more and the disclosure is for research or statistical purposes in accordance with section 42 of the FOIP Act? [s. 43(1)(a)(i)(B) with s. 42]

☐ Has the record been inexistence for 75 years or more? [s. 43(1)(a)(ii)]

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

☐ Has the record been in existence for 25 years or more and the disclosure would not be harmful to the business interests of a third party under section 16 of the FOIP Act? [s. 43(1)(b)(i) with s. 16]

☐ Has the record been in existence for 25 years or more and the disclosure would not be harmful to a law enforcement matter within the meaning of section 20 of the FOIP Act? [s. 43(1)(b)(ii) with s. 20]

☐ Has the record been in existence for 25 years or more and the information is not subject to any type of legal privilege under section 27 of the FOIP Act? [s. 43(1)(b)(iii) with s. 27]

If you have checked one or more of these authorities for Disclosure of Information in Archives and this is the only disclosure is archival, go to *Accuracy and Retention* under Part 9 of this assessment.
If there are other disclosures, or if no authorities listed above apply, go to *Disclosure of Personal Information* under Part 8 of this assessment.

Part 8: Disclosure of Personal Information (section 40)

Is the Initiative disclosing personal information? **YES**

Personal information will be disclosed only for the purpose of research under section 42 and would include an information sharing agreement where applicable.
See appendices for template. All activity will align and meet the requirements of section 40 of the FOIP act.

If the answer is YES, continue under this part of the assessment.
If the answer is NO, go to *Accuracy and Retention* under Part 9 of this assessment.

There are many authorities that allow for a public body to disclose personal information under the FOIP Act. Please think about all personal information data elements disclosed and all instances of disclosure; the disclosure of some personal information data elements may have a different authority than other personal information data elements. Additionally, a disclosure to one public body or organization may have a different authority than a disclosure to another one.

Section 40(4) requires that a public body may disclose personal information only to the extent necessary to enable the public body to the carry out the purposes (described in the disclosure provisions that follow) in a reasonable manner.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Check only those types of disclosure that are specifically intended to occur under the Initiative under assessment.

☒ The disclosure is in accordance with a FOIP Act access request. [s. 40(1)(a)]

☒ The disclosure is not an unreasonable invasion of a third party's privacy under s. 17. [s. 40(1)(b) with s. 17]

Note: Section 17(2) lists when a disclosure is not an unreasonable invasion of privacy under formal access. If disclosure under this Initiative is listed in section 17(2), then this disclosure provision may apply.

☒ The personal information is being disclosed under this Initiative according to the original purpose for which it was collected or compiled or for a use that is consistent with that original purpose of collection. [s. 40(1)(c)]

If the above is selected and the use includes consistent purposes, please confirm the consistent use meets both of the following:

☒ The consistent use has a reasonable and direct connection to the purpose for which the personal information was originally collected or compiled.

AND

☒ The consistent use is necessary for performing the statutory duties of or operating a legally authorized program of the public body using the personal information.

Provide details/explanation: **The initiative is undertaken by the municipalities to serve our residents. Municipalities operate under the MGA and FOIP**

☒ The individual has identified the information and consented to the disclosure in the prescribed manner. [s. 40(1)(d)]

We will create a privacy statement and conditions of use policy for the open data portal including an opt-out option for certain personal contact information. See Appendices for examples

☐ The disclosure is done in order to comply with an enactment of Alberta or Canada, or with a treaty, arrangement or agreement made under an enactment of Alberta or Canada. [s. 40(1)(e)]

☐ The disclosure is for any purpose where an enactment of Alberta or Canada authorizes or requires the disclosure. [s. 40(1)(f)]

☐ The disclosure is to comply with a subpoena, warrant or order made by a court, person or body having jurisdiction in Alberta to compel the production of information or with a rule of court binding in Alberta that relates to the production of information. [s. 40(1)(g)]

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

☐ The disclosure is to an officer or employee of the public body or to a member of the Executive Council, and is necessary for the performance of the duties of that officer, employee or member. [s. 40(1)(h)]

☐ The disclosure is to an officer or employee of a public body or to a member of Executive Council, if the disclosure is necessary for the delivery of a common or integrated program or service and the performance of the duties of the officer or employee or member to whom the information is disclosed. [s. 40(1)(i)]

☐ The disclosure is for the purpose of enforcing a legal right that the Government of Alberta or a public body has against any person. [s. 40(1)(j)]

☐ The disclosure is for the purpose of:

i) Collecting a fine or debt owing by an individual to the Government of Alberta or to a public body, or to an assignee of either of them, [s. 40(1)(k)(i)] or

ii) Making a payment owing by the Government of Alberta or a public body to an individual. [s. 40(1)(k)(ii)]

☐ The disclosure is for the purpose of determining or verifying an individual's suitability or eligibility for a program or benefit. [s. 40(1)(l)]

☐ The disclosure is to the Auditor General or any other prescribed person or body for audit purposes. [s. 40(1)(m)]

☐ The disclosure is to a member of the Legislative Assembly who has been requested by the individual the information is about to assist is resolving a problem. [s. 40(1)(n)]

☐ The disclosure is to a representative of a bargaining agent who has been authorized in writing by the employee the information is about to make an inquiry. [s. 40(1)(o)]

☐ The disclosure is to the Provincial Archives of Alberta or to the archives of a public body for permanent preservation. [s. 40(1)(p)]

☐ The disclosure is to a public body or a law enforcement agency in Canada to assist in an investigation:

i) Undertaken with a view to a law enforcement proceeding, [s. 40(1)(q)(i)] or

ii) From which a law enforcement proceeding is likely to result. [s. 40(1)(q)(ii)]

☐ The disclosure is from a law enforcement agency and the information is disclosed:

i) To another law enforcement agency in Canada, [s. 40(1)(r)(i)] or

ii) To a law enforcement agency in another country under an arrangement, written agreement, treaty or legislative authority. [s. 40(1)(r)(ii)]

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Note: law enforcement is defined under section 1(h) of the FOIP Act. In order to apply this authority, please review this definition and Bulletin No. 7: Law Enforcement found at: http://www.servicealberta.gov.ab.ca/foip/resources/bulletins.cfm

☐ The disclosure is so that the spouse or adult interdependent partner, relative or friend of an injured, ill or deceased individual may be contacted. [s. 40(1)(s)]

☒ The disclosure is in accordance with s. 42 (Disclosure for Research or Statistical Purposes) or 43 (Disclosure of Information in Archives). [s. 40(1)(t) with s. 42 or s. 43]

*If **YES**, see also **Disclosure for Research or Statistical Purposes** and/or **Disclosure of Information in Archives** under Parts 6 and 7 of this assessment.*

☐ The disclosure is to an expert for the purposes of s. 18(2). [s. 40(1)(u) with s. 18(2)]

Section 18(2) applies under formal access when disclosure may be harmful to individual or public safety and the personal information of the applicant must be disclosed to an expert in order for their assessment to determine if section 18 applies.

☐ The disclosure is for use in a proceeding before a court or quasi-judicial body to which the Government of Alberta or a public body is a party. [s. 40(1)(v)]

☐ The disclosure is by the Minister of Justice and Solicitor General or an agent or lawyer of the Minister of Justice and Solicitor General to a place of lawful detention. [s. 40(1)(w)]

☐ The disclosure is for the purpose of managing or administering personnel of the Government of Alberta or the public body. [s. 40(1)(x)]

☐ The disclosure is to the Director or Maintenance Enforcement for the purpose of enforcing a maintenance order under the *Maintenance Enforcement Act*. [s. 40(1)(y)]

☐ The disclosure is to an officer of the Legislature, if the information is necessary for the performance of the duties of that officer. [s. 40(1)(z)]

☐ The disclosure is for the purpose of supervising an individual under the control or supervision of a correctional authority. [s. 40(1)(aa)]

☐ The Initiative is disclosing personal information that is available to the public. [s. 40(1)(bb)]

☐ The Initiative is disclosing personal information that is routinely disclosed in a business or professional context, i.e. limited to an individual's name and business contact information, including business title, address, telephone number, facsimile number and e-mail address and does not reveal other personal information about the individual or personal information about another individual. [s. 40(1)(bb.1)]

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

☐ The disclosure is to the surviving spouse or adult interdependent partner of a relative of a deceased individual if, in the opinion of the head of the public body, the disclosure is not an unreasonable invasion of the deceased's personal privacy. [s. 40(1)(cc)]

☐ The disclosure is to a lawyer or student-at-law acting for an inmate under the control or supervision of a correctional authority. [s. 40(1)(dd)]

☐ The head of the public body believed, on reasonable grounds, that the disclosure will avert or minimize a risk of harm to the health or safety of a minor. [s. 40(1)(ee)(i)]

☐ The head of the public body believed, on reasonable grounds, that the disclosure will avert or minimize an imminent danger to the health or safety of any person. [s. 40(1)(ee)(ii)]

☐ The disclosure is to the Administrator of the *Motor Vehicle Accident Claims Act* or to an agent or lawyer of the Administrator for the purpose of dealing with claims under that Act. [s. 40(1)(ff)]

☐ The disclosure is to a law enforcement agency, an organization providing services to a minor, another public body or any prescribed person or body if the information is in respect of a minor or a parent or guardian of a minor and the head of the public body believes, on reasonable grounds, that the disclosure is in the best interests of that minor. [s. 40(1)(gg)]

Additional provisions related to post-secondary educational bodies are in place. If this PIA is being completed by a post-secondary institute, please check with your FOP Office.

If you checked at least one of the preceding authorities for disclosure, you have identified an authority under the FOIP Act that allows the Initiative to disclose the personal information. Please continue the assessment.
If the answer is No to all of these disclosure authorities above, you have not identified an authority under the FOIP Act that allows the Initiative to disclose the personal information. Please contact your FOIP Coordinator for assistance (ext. 3229).

Part 9: Accuracy and Retention (section 35)

If an individual's personal information is used by a public body to make a decision that directly affects the individual, the public body must make every reasonable effort to ensure that the information is accurate and complete.

An individual has a right to access their personal information for a period of one year after it is used to make a decision that directly affects them. A shorter retention

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

period may be agreed upon by the individual, the public body and any other body that approves retention schedules. Or there may be longer retention periods required due to business and legal requirements.

It is important that you ensure an appropriate records retention and disposition schedule is applied. Alberta government records cannot be destroyed or archived without a records retention and disposition schedule in place. This increases risk in storing records longer than may be required and potentially increases the volume of responsive records under a formal access request.

Do you have an approved records retention and disposition schedule for the records subject to this initiative? [s. 35(a)] *If yes, please provide the records retention and disposition schedule number or name: you may contact Information Management Services for assistance in determining retention. Ext. 8308 or 3229)*

1. ***STRATEGIC MANAGEMENT – GRANTS AND SPONSORSHIPS ~ Grant Applications* (by County): Smart Cities Challenge – Virtual Agriculture Lab**

   Records relating to the County's application, approval and assignment of grant program applications either accepted, rejected or refused (successful or unsuccessful) by outside organizations such as Federal or Provincial Governments.

   Note: Grants are regulated under Alberta Regulations 123/2000 Municipal Affairs Grants

   CLOSURE CRITERIA and RETENTION:

   After application approved or rejected, retain for 11 years and destroy (this is based on the Limitations Act)

2. **INFORMATION MANAGEMENT – AGREEMENTS -**

   Confidentiality agreements and related records between the County and external bodies (e.g. data matching and data linking) dealing with issues such as use of data and/or information.

   Also includes records relating to research and/or statistical agreements.

   Note: Section 42 of the FOIP Act says the County may disclose personal information for research purposes only if an agreement to comply with all approved conditions, the Act, and any applicable policies/procedures are signed by the person to whom the information is disclosed.

   Section 9 of the FOIP Regulation sets out the conditions for an Agreement for Disclosure.

   MRD - Legislative and Administrative Services Departments

   CLOSURE CRITERIA - Destroy 11 years after all conditions relating to the agreement have been satisfied fully

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

If the answer is No, or if you are uncertain, please contact the individual(s) responsible for records management in your public body.
This is not a PIA requirement but another business consideration.

Are there procedures in place to enable an individual to request/review a copy of their own personal information? [s. 35(b)]

If the answer is No, or if you are uncertain, please contact your FOIP Coordinator for assistance (ext. 3229).

Part 10: Correction of Personal Information (section 36)

If an individual believes there is an error or omission in their personal information, they have the right to request correction.

The public body must not correct an opinion such as professional or expert opinions.

Annotation or Linking: if the correction is not made or cannot be made, the request for correction must be annotated or linked to the record.

*Note: **Annotate** means written on a record close to the information. **Link** means attach to, join or connect to the original record.*

Check all that apply.

☐ There are procedures in place to correct, annotate or link an individual's personal information if requested, including what source was used to update the file. [ss. 36(1), (2), (3) and (6)]

☐ If personal information is corrected, are there procedures in place to notify other holders of this information in accordance with the FOIP Act? [ss. 36(4) and (5)]

☐ Are there procedures in place to give written notice to the individual when a correction, annotation or linkage has been made to an individual's personal information? [s. 36(6)]

☐ Are there procedures in place to transfer a request for correction to another public body and notify the individual of the transfer? [s. 15]

If you have not checked all boxes in *Correction of Personal Information* under Part 10 of this assessment as *No*, please contact your FOIP Coordinator for assistance (ext. 3229).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Part 11: Security and Storage for the Protection of Personal Information (section 38)

A public body is required to protect personal information in its custody or under its control by making reasonable security arrangements against such risks as unauthorized access, collection, use, disclosure or destruction. This PIA Questionnaire is not a security assessment, nor a threat and risk assessment.

Please complete this part of the assessment with the understanding that ideally this section should be completed in collaboration with the information security office of your public body, or individuals responsible for information security, who can advise in relation to risk and vulnerability. The head of the public body, or their delegate, is responsible to ensure personal information is protected under the FOIP Act.

The "Business Owner" or "Custodian" with day-to-day responsibility for the information is accountable for any risk to the security of the confidential and personal information captured under this Initiative or under the scope of this PIA. This accountability to the head of a public body, or their delegate, must be considered and understood on the part of the program area and signatories signing off on this PIA.

If your public body does not have an information security policy, it is a good idea to develop one based on current industry standards, with consideration to the type and sensitivity of the information in your public body's custody and control. Sometimes these security measures may be simple physical ones (such as locking a cabinet) or administrative (such as training) or technical. For further direction, please refer to the list of security resources attached, in consultation with your public body's information security or information technology resources.

Does this Initiative comply with your public body's information security management policies, rules and procedures? [s.38]

No – Parkland County does not have a security policy in place but one will be created for the purpose of this project. Our preliminary plans have the project being all virtual and existing on a cloud based platform. We are working with multiple vendors on the planning stage. All have security policies. When we do the final plans for the project we will be working with the vendors and creating a policy that fits all the government requirements as well technical obligations for our users.

If the answer is YES, please continue with the assessment.
If the answer is NO, you have not satisfied the security requirement of this PIA. Please contact the Information Technology Supervisor for assistance (ext. 8414).

How is the information involved in this Initiative classified for security purposes?

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Your public body may have its own information security classification and if it does, you should apply that classification. If not, you may wish to adapt the Government of Alberta classification system to the types of information in your public body:

http://imtdocs.alberta.ca/Information_Security_Classification.pdf

Please provide or describe the information classification. If you have any questions regarding the classification please contact your records management or information security office.

Provide Department/Service Area Security Contact Information.

This should be the name of the individual able to respond to questions about meeting reasonable security measures under this Initiative.

Name	Barb Scully		
Title	Connected Communities Program Manager		
Dept. or Service Area	Smart Cities		
E-Mail	[redacted]@parklandcounty.com	Phone	780-968-8888 ex[redacted]

Additional Comments:

Part 12: Signatures

Suggested Signatures with Signatories names printed and date of signature.

Signature: _____ Signatory Name: _____	Date: _____
Service Area/Department – responsible to provide information in this PIA related to the Initiative that is complete and accurate.	
Signature: _____ Signatory Name: _____	Date: _____
FOIP Coordinator – provides support in understanding the PIA Questionnaire and meeting FOIP Act requirements.	
Signature: _____ Signatory Name: _____	Date: _____

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Information Services Manager - provides support in understanding compliance with Parkland County's security directives.	
Signature: _____ Signatory Name: _____	Date: _____
Immediate Supervisor of the owner of the PIA – someone with accountability for the department/service area or records of the project initiative	

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Proposal to Access Personal Information for Research or Statistical Purposes

Identification of Researcher

Name *(Last, First, Initials)*				
Mailing Address *Street*		*City/Town/Village*	*Province*	*Postal Code*
Telephone Number ( )		Fax Number ( )		
E-mail Address				

Provide the following additional information, if applicable:

Institutional, Society or Corporate Affiliation *(include department if relevant)*
Position
Provide the name of your Academic Advisor if you are a student

Provide a curriculum vitae including the following information: education, research experience, and knowledge of subject.

Description of Research Project

Attach the following information:

1. A general description of the research project *(include the objectives of the project and the proposed method(s) of analysis).*
2. An explanation of why the research project cannot be accomplished without access to personal information about named or identifiable individuals.
3. A detailed explanation of how the personal information will be used, including a description of any proposed linkages to be made between personal information in the records requested and any other personal information.
4. The expected period of time during which access to these records may be required.
5. The expected period of time during which these records will be used.
6. The benefits to be derived from the research project.
7. Describe the security measures you propose to put in place. The security and confidentiality of the personal information that will be in your custody must be protected and unauthorized disclosure must not occur.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Funding

Has funding to complete the project already been approved or received? ☐ Yes ☐ No

If funding is not already in place, explain the conditions and circumstances that will allow the project to be completed.

Additional Information

Please add any other information that you believe will assist

_____ in assessing this application.

Name of Public Body

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Records Requested

Describe all records containing personal information to which access is requested. Provide as much detail as possible. Access will be given only to records listed below and only for the purposes approved for the research project described on Page 2 of this form. Any changes or additions to this list after the application is submitted should be made in writing and will require approval in writing from

Agreement for Access to Personal Information for Research or Statistical Purposes

This agreement is used only when a Proposal to Access Personal Information for Research or Statistical Purposes ("the Proposal") has been approved. The Proposal must be appended to this agreement and forms part of the agreement.

BETWEEN: _____
Name of Researcher

AND: _____
Name of Public Body

Description of Research Project

The research project for which the accessed records will be used is referred to in this agreement as:

Details of the purpose of the research, how the information will be used, and linkages that will be done are included in the Proposal.

SA 115 (2009/05)

Records Requested

Only those records requested in the Proposal will be provided ("the records"). Any changes or additions to the list must be made in writing and will require approval in writing from

_____

Name of Public Body

Clarification of the records requested is shown below if required.

In the event that there is a difference between the records requested above and the records requested in the Proposal, the information about records requested in this agreement governs the agreement.

The expiry date for access to the records listed in the Proposal and this Agreement is _____

(year/month/day)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Fee

The Researcher is responsible for paying any fees incurred by

_____
Name of Public Body

to search for, copy and or provide the records.

The estimated fee is $ _____.

The Researcher understands that this estimate may be revised at any time by

_____
Name of Public Body

and any revision will be made in writing.

Approval of Terms and Conditions of Access

_____
Name of Public Body

approves the following terms and conditions of access.

_____
Name of Public Body

reserves the right to withdraw access to the records without prior written notice if this becomes necessary under the Act.

Terms and Conditions of Access

The Researcher understands and will abide by the following terms and conditions:

Security

1. The Researcher is responsible for maintaining the security and confidentiality of all personal information found in or taken from the records.

2. The Researcher, and only the following persons, will have access to this personal information in a form that identifies, or could be used to identify, the individual(s) to whom it relates:

_____	_____	_____
_____	_____	_____
_____	_____	_____
_____	_____	_____

Before any personal information is disclosed to the persons listed above, the Researcher will obtain a written agreement from each of them to ensure they will not disclose that personal information to any other person and will be bound by all terms and conditions of the present agreement. The Researcher will keep a copy of each such agreement, and will provide

_____
Name of Public Body

with a photocopy of each agreement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

3. None of the records (including copies of them or notes containing personal information taken from them) will be left unattended at any time, except under the conditions described in Clauses 4, 5 and 6, below. If the Researcher is using the records on the premises of

_____
Name of Public Body

the Researcher will comply with the security procedures of

_____
Name of Public Body

4. Any copies of the records and any notes which contain personal information taken from them will be kept at the following address(es):

_____ _____
_____ _____
_____ _____
_____ _____
_____ _____

No records will be removed from the above premises without the prior written consent of

_____
Name of Public Body

5. Physical security at the above premises will be maintained by ensuring that the premises are securely locked, except when one or more of the individuals named in Clause 2 are present, as well as by the following additional measures (e.g. locked filing cabinet):

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Security Continued

6. Individually identifiable information from the records will be maintained on a computer system to which users, other than those listed in Clause 2, have access.

   ☐ Yes ☐ No

   If yes, access to the information will be restricted through the use of passwords and by other computer security measures that prevent unauthorized access, and can trace such unauthorized access, including the following methods:

7. _____
   Name of Public Body
   will be permitted to carry out on-site visits and such other inspections or investigations that it deems necessary to ensure compliance with the conditions of this agreement.

Use of Personal Information

8. Personal information contained in the records will not be used or disclosed for any purpose other than the research project described in the proposal (including additional linkages between sources of personal information), nor for any subsequent purpose, without the express written permission of

   _____
   Name of Public Body

9. Papers or any other works which describe the results of the research undertaken will be written and/or presented in such a way that no individuals referred to in the records can be identified and no linkages can be made between any personal information found in the records and personal information that is publicly available from other sources. There will be no exceptions to this rule without prior and specific written permission from

   _____
   Name of Public Body

10. Any case file numbers or other individual identifiers to be recorded on computer will be created by the Researcher or one of the persons listed in Clause 2 and will not relate to any real case numbers found in the records. Any such identifiers are to be used for statistical purposes only.

11. No case file numbers or other individual identifiers assigned for the purposes of the research project will appear in any other work.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Use of Personal Information Continued

12. No personal information that identifies or could be used to identify the individual(s) to whom it relates will be transmitted by means of any telecommunications device, including telephone, fax, cable, and wireless communication networks.

13. Unless expressly authorized in writing by

_____
Name of Public Body

no direct or indirect contact will be made with the individuals to whom the personal information relates.

14. Individual identifiers associated with the records, or contained in copies of them, will be removed or destroyed at the earliest time at which removal or destruction can be accomplished consistent with the research purpose. At the latest, this will occur by: _____.
(year/month/day)

Any extension to this time limit must be approved in writing by

_____
Name of Public Body

The removal of individual identifers will be done in a manner that ensures that remaining personal information (including any found in research notes) cannot be used to identify the individual to whom it relates. **If necessary, this will be done by destroying copies of records or pages of notes in their entirety.** All destruction or removal of individual identifiers will be confidential and complete in order to prevent access by any unauthorized persons.

15. The Researcher is responsible for ensuring complete compliance with these terms and conditions. In the event that the Researcher becomes aware of a breach of any of the conditions of this agreement, the Researcher will immediately notify

_____
Name of Public Body

in writing.

16. The Researcher understands that the *Freedom of Information and Protection of Privacy Act* specifies that a person who under the Act wilfully contravenes the Act's requirements for collection, use and disclosure of personal information is guilty of an offence and liable to a fine of up to $10,000. In addition to liability for an offence, the Researcher understands that

_____
Name of Public Body

may take legal action against the Researcher if there is contravention of the terms and conditions of this agreement.

17. Written consent of

_____
Name of Public Body

must be obtained prior to the transfer of this agreement to another person, or a change in the use of the information is implemented. Consent may be arbitrarily withheld at the sole discretion of

_____
Name of Public Body

access requests, consent, avoiding and responding to breaches – these are growing and constant challenges subject to ever-changing regulations.

If you have an internal or external breach of privacy, mishandle information or lose control of your information, you may face costly consequences including regulatory sanctions, monetary penalties and reputation damage.

We're here to help ensure that never happens.

Cenera's Privacy and Information Management team can help you:

- Understand federal and provincial access privacy policies
- Organize and identify your information more efficiently
- Complete a Privacy Impact Assessment
- Train your teams to better manage privacy and information issues
- Undertake a gaps reports to identify shortfalls
- Establish and maintain processes to help you in the long term

We regularly undertake half and full-day training on all aspects of Privacy and Information Management. You can find up-coming events here.

Contact us to take the first step in understanding your Privacy and Information obligations.

What Our Clients Are Saying

"Cenera provided excellent career transition services. The courses were very helpful, especially Start Your Own Business, financial planning and resume building. My overall experience with Cenera greatly surpassed my expectations. I am grateful for the help."

EXECUTIVE SUMMARY

In the face of a rapidly aging population, the City of Côte Saint-Luc will implement a connected framework, leveraging smart devices and related technologies that will empower seniors to: (1) live more safely and independently in their homes; (2) be better connected to their communities and city services; (3) be more socially engaged, improving the overall well-being and quality of life for older adults and reducing stress on families and caregivers, the healthcare system, and long-term care facilities.

THE RIGHT PLACE AT THE RIGHT TIME

Côte Saint-Luc is a city of approximately 34,000 people, of which a third are seniors (age 65+). According to Statistics Canada projections, that proportion represents where Canadian society is heading over the course of the next few decades. Our community, which has been committed to improving the health and well-being of older adults through a variety of programs and services, is therefore the ideal ground upon which to test new initiatives related to aging.

The demographic shift will place an unprecedented strain on the health care system, both in terms of cost and, also, resources. In an effort to adapt to future demographics and improve the continuum of care, new solutions are being explored by the health system that will break down compartmentalization and bring care to where the patient is. Digital health is the future, and the Smart Cities Challenge has presented an opportunity for Côte Saint-Luc to lay the foundation for a partnership that will deliver better patient care to the home. What we have before us is the perfect opportunity, at exactly the right time, in the ideal place.

OUR VISION

The VillAGE Initiative is the future of aging in community. It operates simultaneously in the domains of technology and social transformation, and uses a Design-Thinking approach that continuously engages people and enables us to create appropriate and relevant services that meet the needs of older adults. With a focus on prevention, the Village Initiative is positioned to support the health sector while leveraging the trust and relationships that exist between people and their community.

Participants will have a single entry point, where initial intake and onboarding is done. A professional will make an assessment of his or her need and propose solutions from a menu of interventions or services. These interventions include everything from the installation of technology for safety and convenience in their home, to social prescription, to participation in the VillAGE Community App. Privacy will be a core principle by which the VillAGE Initiative is designed and operated, as will scalability.

The long-term impacts of the VillAGE Initiative will be felt on multiple levels. Older adults will see an increase in their autonomy, and feel more secure living in their homes. Social isolation will be reduced. The families of older adults will gain peace of mind and experience reduced stress. Community capacity, connectedness and wellness will be improved. In the health and social services domain, the timeliness of care will be improved and placement delayed.

GOVERNANCE AND PARTNERSHIPS

In setting up the VillAGE Initiative, we will create a federal non-profit organization (NPO). The decision to establish a NPO with a Governing Board and its own staff, rather than run the program directly through the City was based on many considerations which include: the size of the project, reduced interference from electoral cycles, more flexibility in terms of procurement and labour, and the ability to apply for a variety of grants. The City will, however, maintain some governing control,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

with two elected officials on the Governing Board, and approval rights over the budget.

The Governing Board, totalling nine people, will be made up of independent members from a diverse and relevant range of backgrounds. The NPO will be led by a CEO and a Management Team, who will set up and manage the entirety of the VillAGE Initiative. A Technology Partner will act as the CTO and be responsible for the whole of the technology domain, platform development, and related partnerships.

A rich ecosystem of partners, including all levels of government, researchers, health sector representatives, private industry, community groups, and residents will collaborate to address the complex and widespread challenges our society faces related to aging. Côte Saint-Luc will be the epicentre for innovation—a Living Lab where senior health and aging will be studied, and solutions tested with residents, in the real world.

- The City of Côte Saint-Luc will be intimately involved in the development and implementation of the VillAGE Initiative through such means as providing space and in-kind services, co-developing programs, and cross-promotion.
- Our research partners at the Institut universitaire de gériatrie de Montréal and at the Université de Sherbrooke have already helped develop the VillAGE Initiative, and they and other research groups will continue in this role.
- Our health partners at the Ministère de la Santé et des Services sociaux and the CIUSSS West-Central (Regional Health Board) fully support the Initiative and will leverage it to develop their technological roadmaps and further their goals.
- MEDTEQ will support the VillAGE Initiative through in-kind contributions of expertise and funding.
- Other partners will add expertise and collaborate with the VillAGE Initiative in their respective domains.

HOW IT WILL RUN

The VillAGE Initiative was distilled into five main projects, or project categories. Each of these contain several activities. The projects are:

1. **Governance and Operations**
2. **Community Engagement & Social Transformation**
3. **Platform Development**
4. **Service Delivery**
5. **Sustainability and Transferability**

The short-term outcomes associated with the VillAGE Initiative activities include:

- Awareness of the VillAGE Initiative—measured by the number of people informed about the project through communication efforts;
- Participation in Community Engagement—measured by the number of people who reach out and participate in community Engagement activities;
- Active involvement of community in service design—measured by the number of people engaged in the design and testing of products and services;
- Adoption of Products and Services—measured by the number of people onboarded and who have adopted at least one product or service;
- Participant satisfaction—measured by survey results from participants, stakeholders, and data from the platform.

Mid-term outcomes include:

- Improved digital literacy in older adults;
- Improved safety in the home;
- Improved function and autonomy;
- Improved perception of personal physical and mental well-being;
- Increased social connections;
- Better communications between seniors and their families;
- Reduced mechanical falls and increase in fall efficacy.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

EXECUTIVE SUMMARY

ATIA - 21(1)(b)

The VillAGE Initiative has an implementation plan that dictates the scheduling, sequencing, and dependencies for each activity, their outputs and deliverables, and those responsible for carrying them out. In the first year, a series of plans will be generated that set the foundation for the proper management of the Initiative.

THE TECHNOLOGY

Aging in place technology is the fastest growing sector in the longevity economy. The marketplace is filled with a dizzying array of options that seniors can choose from. During the finalist phase of our project, we consulted with residents to discover their needs, then researched and evaluated a number of solutions that could meet those needs. We created an evaluation criteria, and in the end selected the most suitable technologies to use in our pilot project.

The Pilot Project

[redacted] DOMotics at the Université de Sher- : home solution was chosen as the for the pilot project. Based on open it consists of small passive sensors, dded Amazon's Echo and a floor light erbrooke team helped us install the homes of pilot participants. We also ac Look Watch for safety on the go. inues until May 2019, but so far, we interesting data and will use what we learned to shape our future service delivery.

The VillAGE Platform

The VillAGE Platform will allow seniors to access resources in three categories for help when they need them: convenience, safety, and social connectedness and engagement. The vision and architecture for the Connected Technology Framework is based on the principles of open technologies, great experiences at home and on the go, smart automation, interoperability, and privacy and security.

LISTENING TO OUR COMMUNITY

Community engagement is at the heart of the VillAGE Initiative, and it has shaped every aspect of this Final Proposal. Our research partners at the Université de Montréal and the CIUSSS Centre-West helped us structure our community engagement, which consisted of focus groups, public consultations, and a senior advisory council that consulted the seniors themselves, caregivers, staff who work with seniors, future seniors and the general public.

A Community Engagement Plan s [redacted] whereby residents were given op various levels of participation. We as challenges to aging in place, perce nology, what the City can leverag concerns. We informed residents a were trying to do, consulted on the sulted on their impression of prop collaborated with them, and finall them through inclusion in a pilot prc

For the next phase of the VillAGE Initiative, we will add four principles to our community engagement approach: outreach, participation, user-friendly material, and a Design-Thinking model, which will enable residents to co-design and test products and services. In laying the foundation for a VillAGE Community App, many community-building social innovations will be tested. Other community engagement activities include: pop-up workshops, listening sessions, showcases, interviews, thrivability sessions, and more.

DATA AND PRIVACY

The VillAGE Initiative is deeply committed to implementing the highest standard of privacy and data protection. Sharon Polsky, privacy expert and President of the Privacy and Access Council of Canada, worked with our team to develop measures that will ensure that we depart from a point of Privacy By Design, going beyond the baseline and allowing participants to maintain control over the information. A Data Governance and Privacy Protection Policy will be created at the very beginning of the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

EXECUTIVE SUMMARY

FINANCIALS

Our Projected Financial Plan reflects the planned funding strategy through which the VillAGE Initiative will be financed. This includes the $10 million start-up fund financed by Infrastructure Canada through 13 milestone payments, and revenue generated from number of sources to ensure sustainability and scalability in the long-term. These include:

- Partner support, most importantly from MEDTEQ and potentially from the Quebec Ministry of Health and Social Services;
- Subsidies, research grants, government grants, foundations;
- Smart device solution sales;
- Fundraising;
- Planned giving and endowment funds;
- Solution support services.

OTHER CONSIDERATIONS

In conjunction with our economic development partners, we will integrate diversity and inclusion into our future project team. We will also further consult with the Indigenous groups in our region and make a strong effort to contact our own local Indigenous population.

In addition, we will ask the provincial government to expand its home adaptation programs to include smart technology devices as part of the program.

CONCLUSION

We believe in the transformational power of the VillAGE Initiative, not just for older adults and their families, but for Canadian society at large. Through a strong governance model, important partnerships, community involvement, technology and social innovation, solid privacy policies and sound management, we will bring the project to life and change the future of aging in community.

Chapter 1 VISION

ATIA - 21(1)(b)

1.1 CONTEXT

Across the country, the population is aging. The number of older adults as a percentage of the population is increasing, and life expectancy is rising. Canadians face many challenges in light of this, at the individual and family level, the community level, and of course, in terms of the health care system.

Our society has not been designed around older adults or the challenges that they face, such as how and where to live safely and independently, how to easily get around, how to carry out the instrumental activities of daily living (IADLs), and [redacted] ite in community life in a meaning-

[redacted] ng a part of society increasingly [redacted] plugged in' to technology, some- [redacted] ny of the current older adults are [redacted] e with and/or cannot easily use or [redacted] ough there is an avalanche of new [redacted] geted products and smart home [redacted] evices being pushed at them. This [redacted] ier challenge, another obstacle for older adults to overcome.

Isolated people do not recover as well from illness as people with meaningful connections. They are more likely to get sick, get depressed, and die at a younger age than those who are surrounded by people they can count on. Many older adults have children who live in other cities and/or who lead busy lives and they don't want to impose on them.

As we have seen with our own first responder service and in public consultations, 9-1-1 is often the go-to place for people who have an issue and few people to turn to. Many older adults attempt to get some of their needs met through city services such as the public library or recreation department, as they do not feel they could rely on social services. In some cases they cease to participate in civic life altogether, due to reasons such as access to transportation, or for reasons as mundane as being blocked in by a snowy walk that they can no longer shovel themselves.

1.2 OUR JOURNEY

In our preliminary proposal to the Smart Cities Challenge, entitled SHARED (Senior Health and Real-time Environmental Data) we addressed social isolation mainly in terms of security. In that vision, an isolated older adult would have more confidence about living autonomously with the knowledge that the city was looking out for their well-being, and that there would be a nuanced response to what would happen to them inside their dwellings and outside in the community. All of this was fueled by artificial intelligence (AI) enabled technologies in the home and in community. Environmental sensors were part of the vision as well. Noise and air pollution are key factors in the environment and have an impact on wellness, especially in vulnerable populations.

The spirit of the original vision of the 'SHARED' proposal has been preserved at its core, but after extensive public consultation and research, we deepened our understanding of the array of challenges older adults face, including meeting their daily needs and getting access to the health and social services they require.

At the public consultations, we learn[redacted] adults were concerned not simply w[redacted] security as we originally understoc[redacted] social engagement and a desire for [redacted] tasks of daily living. With some mo[redacted] our original vision, we could have a[redacted] er impact on the reduction of social [redacted] helping our residents age in commu[redacted]

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ATIA - 21(1)(b)

1.2.1 Our revised Challenge Statement

In the face of a rapidly-aging population, the City of Côte Saint-Luc will implement a connected framework, leveraging smart devices and related technologies that will (1) empower older adults to live more safely and independently in their homes; (2) be better connected to their communities and city services; (3) be more socially engaged, improving the overall well-being and quality of life for older adults and reducing stress on families and caregivers, the healthcare system, and long-term care facilities.

The name of the initiative in our preliminary proposal did not reflect the amplitude of the new vision, which is why we changed it to the VillAGE Initiative. The environmental monitoring that we outlined in the preliminary proposal, while important, was not a top priority for our residents and not at the heart of issues that face our existing and future older adults. The VillAGE Initiative team opted to position environmental monitoring as one of the activities in the longer-term.

In the City of Côte Saint-Luc, 30 percent of our population is age 65 or older, which means that our community already reflects the future demographics of Canada. The issues of social isolation, safety, and the challenges of aging in place are very real for our residents as they are for those in [redacted] nities across the country. When the eam discusses the project publicly, is overwhelmingly positive and al- sonal. Everyone has a story about a r who fell, or would have benefitted ces we discuss.

[redacted] versal fact and process. Every com- ry province has to address it in such isure that their residents thrive in the face of it.

1.3 THE PROPOSAL

> **“It takes a village to raise a centenarian.”**
>
> — Susan Pinker, *The Village Effect*

The VillAGE Initiative is the future of aging in community. While the city is where the interface occurs with the older adult, it is only one player with many partners who work in tandem to reduce isolation, increase safety, and increase engagement and well-being. The VillAGE Initiative operates simultaneously in two domains (see figure 1-1):

1. Technology
2. Social Transformation

The teams will work together and use design-thinking methods with continuous community engagement and feedback. The teams will also work with partners to co-create services and t[redacted] ing labs. The feedback from the pul[redacted] the service delivery at every stage, [redacted] what we offer is relevant and impact

Participants will have a single entry [redacted] initial intake and onboarding is done. [redacted] tiative social worker will assess the p[redacted] and preferences, and propose solu[redacted] menu of interventions or services. [redacted] clude the following:

- Home assessment, where a professional assesses the dwelling, flags hazards and identifies ways to improve safety and reduce falls.
- The installation of sensors and safety devices in the home, plus the verification and/or installation of smoke- and CO-detectors.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ATIA - 21(1)(b)

- The installation of convenience technology in the home, to help with IADLs.
- Provision of smart wearables for safety on the go.
- Signing up for the VillAGE App, to connect older adults with vetted community members and city services to help with IADLs.
- Referral to existing city and community services.
- Social prescription.
- Education and training for technology.

The orientation of these services is towards **prevention**. In this way, these services support, rather than supplant the health sector.

Municipalities are the closest level of government to the population and can therefore have the most direct impact on lifestyle and well-being. The role of a city, apart from delivering routine services, is to create an age-friendly environment and to build and foster community. Residents trust their local elected officials and the staff that they interact with on a regular basis. Cities can leverage that trust to reduce isolation and improve health. The VillAGE Initiative would harness those relationships and then add to it more layers and more connections.

1.4 OUTCOMES

The long-term impacts of the VillAGE Initiative will be felt on several levels:

- **Older adults** will be less socially isolated and participate more socially. This will enhance quality of life and well-being. They will also be able to age in place for longer.
- **Families and caregivers** of older adults will have more peace of mind and benefit from a reduced burden and stress perception.
- **City services:** Use of existing city services will increase and the City will earn the Age-Friendly Community designation from the Public Health Agency of Canada. Community capacity, connectedness, and community wellness will be improved.
- **Health and social services:** The timeliness of care will be improved, and there will be a reduction in lower priority emergency calls, with a corollary reduction in hospital admissions. Placement into senior residences will be delayed, and the trajectories of care will be vastly improved, as there will be an integration of community, city and social and health care services. Older adults will receive the right services at the right place at the right time, at a more reasonable cost. The VillAGE Initiative will be aligned with the regional health network in terms of roadmap, data integration, and information privacy protection.
- **The City of Côte Saint-Luc** would become a Living Lab/innovation hub that will advance knowledge with its research part ciplinary innovation will break d sulting in a systems change with relationships in the community, n new structures, new policies, anc delivery in existing programs. As would ripple out across the cou and perceptions of older adults and aging will become a differe for older adults of the future.

[redacted]

1.5 PRIVACY

The VillAGE Initiative is committed to the highest standard of privacy and data protection. Privacy By Design is built into the VillAGE Initiative and will become the standard for other Canadian cities that adopt this program. This will put Canadian cities on the map for the Cities Coalition for Digital Rights, a world initiative to promote and track progress in protecting residents' digital rights in cities[1].

[1] See Bianca Wiley (@ biancawylie) Senior Fellow at the Centre for International Governance Innovation and co-founder of Tech Reset Canada "Why we need to push for data rights in Canada." https://business.financialpost.com/technology/why-we-need-data-rights-not-everything-about-us-should-be-for-sale

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

1.6 SCALABILITY & REPLICABILITY

On the technology side, the VillAGE Initiative is scalable and replicable by design. The menu of services offered can be scaled up or down depending on community resources and the needs of the individual using the services. The basic model of service delivery is the following:

Community Engagement > Intake > Menu of Services > Delivery of services

This model is transferable anywhere in the country. The services and products that we selected are suited to our community at this time, but each city can use the ones it wants from a list that will evolve over time, given the fast-paced evolution of available technologies. The number of services offered can vary or can be added to, depending on the resources available.

The VillAGE Initiative will use technology platforms that are open-source and tool agnostic, This renders the platforms accessible to others and future-proof, as new devices are developed and others become obsolete. All hardware will be easily available, off-the-shelf items, which will minimize the cost of the devices and increase their accessibility.

The value added by the VillAGE Initiative is in the integration platform connected to City and health and social services. This platform will be constantly developing in response to the user experience.

One the social transformation side, most communities already have staff and volunteers who can provide services as described or with local variations. For instance, many public libraries offer technology training for older adults. These programs could be marketed differently as part of an initiative such as this one, or be prescribed, or be tweaked so as to be more accessible (e.g., take the class to the senior residence, or arrange transportation). Not every service need be completely new.

Innovation and design-thinking drive both the technology and social transformation domains of the Village Initiative. We will assess the services and other projects for outcomes and usability—in a continual feedback loop with the end users. Our research partners will help us develop and assess the services and projects. Once we have set up the Village Initiative, delivered the services, learned from our mistakes, and determined the best practices, we will create a guide for other communities so they can replicate what we have done.

1.7 THE ORGANIZATION MODEL AND FLOW OF THE VILLAGE INITIATIVE

The VillAGE Initiative, a non-profit organization, has two main domains out of which all activities and service delivery flows: technology and social transformation. It is overseen by a Governing Board and run by a senior management team. Community engagement, done continually using design-thinking and Agile models, informs all aspects of service delivery.

Research partners, with whom co-creation and living labs will grow, will feed the technology and social transformation domains. On the technology side, digital health and tech solution partners will collaborate and support research and development. On the social transformation side, the City of Côte Saint-Luc is the primary partner, and the one who will also work on the PAD program.

Community partners will work with the VillAGE Initiative as well. There is an initial intake for service delivery, where dossiers are created and users are assessed and then prescribed services from a menu. These services include: referral to existing city and community services, social prescriptions, education and training workshops, home assessment, the VillAGE App, tech safety and tech convenience, a public dashboard, and support from a help desk. Apart from providing services directly to users, the tech and social teams will have platform development, environmental monitoring, and the establishment of an age-friendly city.

Chapter 2 PERFORMANCE MEASUREMENT

Performance measurement is key for understanding, managing and improving what the VillAGE Initiative will be doing. It is a continuous improvement operation which involves checking the performance against that benchmarks. The VillAGE Initiative performance measurement plan uses results-based management principles by:

- Focusing on performance and achievement of outputs, outcomes and impacts.
- Monitoring progress toward the achievement of expected results.
- Integrating lessons learned into decision-making.
- Regular reporting on performance.
- Working beyond processes, activities, products and services to focus on the actual social and economic benefits of projects and programs at the level of beneficiaries.
- Working harmoniously and cohesively to be effective.
- Focusing on sustainable achievements rather than short-term results that have a long-term impact on the lives of people.

2.1 PROJECT ACTIVITIES AND THEIR LINK TO OUTPUTS AND OUTCOMES

The VillAGE Initiative was distilled into five main projects, or project categories. Each of these contain several activities, into which go a number of outputs. The projects are:

Figure 2-1: The five main projects or project categories

Project 1—Governance & Operations

The first project involves setting up the entire framework for the VillAGE Initiative, creating the non-profit organization, hiring the team, formalizing partnerships, planning, creating systems, and creating policies and procedures.

Project 2—Community Engagement & Social Transformation

This project involves a series of activities, including creating a community engagement plan and an age-friendly city plan, in addition to implementing a series of community engagement activities. It also includes a neighbourhood development strategy and activities that lay the groundwork for the VillAGE Community App to be developed.

Project 3—Platform Development

The development of the platform, applications, and smart device technology begins in the first year and goes on until the end of the five years. The technologies being developed are the foundation upon which service delivery will be based.

Project 4—Service Delivery

For our residents, this project *is* the VillAGE Initiative. It involves planning, hiring staff, setting up a delivery point, service design, procedure development, coordination with existing partners, developing a campaign, and launching actual service delivery.

Project 5—Sustainability & Transferability

The final project involves creating and implementing a sustainability plan, expanding existing provincial programs, and creating a guide with best practices for other cities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 2 PERFORMANCE MEASUREMENT

The Logic Model (see Figure 2-2) is a summary of the activities and intended qualitative and quantitative outcomes and will guide the development and improvement of the VillAGE Initiative. It identifies the Challenge Statement and definition of the target audience, as well as secondary audiences, and focuses mostly on service delivery to the residents, as the other projects and deliverables are covered in the GANTT chart and in the Project Management section of this proposal. The model has been created to visually represent the underlying theory and logic of the VillAGE Initiative's service delivery, and to demonstrate how project activities are linked to outputs, short-term outcomes, medium-term outcomes and long-term impacts for individuals and society.

Outputs refer to measurable, immediate deliverables and/or the amount of product/service that is produced or delivered. **Short-term outcomes** refer to new learning and knowledge or change in attitude and skills among the audience. **Mid-term outcomes** refer to changes in behaviour and action that result from this new knowledge. If activities are accomplished, outputs delivered and short and mid-term outcomes achieved, then **Long-term** impacts to older adults, families, the City of Côte Saint-Luc, the health care system and society might be expected to occur.

The outcomes-based performance measurement plan will be focused on outputs and deliverables, while the long-term impacts will be built into the sustainability plan, since it will not be possible to show these kinds of effects during the five-year period.

The Logic Model

Challenge Statement	In the face of a rapidly aging population, the City of Côte Saint-Luc will implement a connected framework, leveraging smart devices and related technologies that will empower seniors to: 1. live more safely and independently in their homes; 2. be better connected to their communities and city services; 3. be more socially engaged, Improving the overall well-being and quality of life for older adults and reducing stress on families and caregivers, the healthcare system, and long-term care facilities.
Audience	The target audience will be older residents (65+) living in Côte Saint-Luc who are beginning to experience a loss of autonomy and want to stay living at home for as long as possible while maintaining autonomy, dignity and respect. They don't need support from social services yet, but are starting to need some help. Secondary audiences will include: family and caregivers, other residents (future seniors), City staff, and Partners.
Input	Funding: Infrastructure Canada Smart Cities Challenge Equipment & Tools: Tech for convenience, tech for safety, and tech for social engagement, social prescription software Facilities: City facilities, participants' homes, office in shopping mall (as of Year 3) Human Resources: Governing Board, Management Team, Technology Partner and Technology Team, Community Engagement Service Delivery Team, Partners, City Staff, Professional services
Activities	• Governance and Operations • Community Engagement and Social Transformation • Platform Development • Service Delivery—Intake assessment, baseline metrics and referral to menu of services including: • Full home assessments and adaptation • Smart technology prescriptions and installations for safety, convenience and social engagement • Social prescriptions and referrals to City programs, activities and services in and around CSL • VillAGE Community App (people helping people) • Training and education workshops for seniors • Help desk, monitoring and support • Sustainability and Transferability

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Outputs

- Policies procedures and guidelines
- Management, Community Engagement, and Service Delivery plans
- Monthly reports to Governing Board and Infrastructure Canada Smart Cities Challenge Team
- Budget compliance
- # of engagement activities offered
- # of participants and partners engaged
- # changes made for Age-Friendly City designation
- Deployment of smart devices for older adults
- # of older adults onboarded (people reached)
- # of home assessments
- # of social prescriptions
- # of referrals to City and community services
- # of workshops offered
- Retention rate of participants
- # of people participating in the VillAGE Community App
- Implementation and best practice guide for transferability

Short-Term Outcomes

- Awareness of VillAGE Initiative (public informed about the Initiative)
- Participation level of community (public signed up to the Initiative)
- Active involvement of community in service design, feedback cycle
- Diversity of community engagement participants (representative of population groups)
- Participant satisfaction as measured by adoption, acceptability, appropriateness, feasibility/usability, efficiency, effectiveness, fidelity, and penetration level

Mid-Term Outcomes for Older Adults

- Improved digital literacy among older adults
- Improved safety in the home
- Improved function/autonomy (Instrumental Activities of Daily Living [IADLs])
- Improved perception of personal physical and mental well-being
- Better communication between seniors and families
- Increase in social connections
- Reduced mechanical falls and increased falls efficacy

Long-Term Impact

Benefits to Older Adults

- Reduced social isolation (nodes of relationships added to care map)
- Increased social participation
- Improved quality of life/wellbeing
- Prolonging ability to age in place

Benefits to families/Caregiver

- Decrease caregiver and family burden (in terms of stress, time, and quality of interaction)

Benefits to the City and the Community

- Increase in use of existing services
- Age-Friendly City designation
- Community capacity

Health and Social Service Outcomes

- Timeliness of care
- Reducing hospital admissions
- Participant experience
- Delaying placement
- Efficiency of care: Better use and integration of community, City and the social and health care services (the right services at the right place at the right time at a reasonable cost)
- Platform that others can plug into (CIUSSS digital health)

Benefits to society

- Living Lab/Innovation Hub advancing knowledge (knowledge translation, transferability)- Interdisciplinary innovation – breaking down silos
- Changing attitudes/perceptions about older adults
- Systems change – new resources, structures, new adjusted policies, improved delivery of existing programs and new working relationship in the community
- Interoperability
- Ripples to future seniors...

Figure 2-2: The Logic Model

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 2 PERFORMANCE MEASUREMENT

2.2 INDICATORS

The following tables show how each of the outcome and impact indicators are defined and how they will be measured.

Governance Indicators	Performance Measures
Organization	Extent to which the progress and compliance with requirements is being monitored and reported
Community engagement	Number of community engagement activities in which residents actively participated
Multi-level Governance	Extent to which the NPO, City, and Tech partner cooperate with each other and with authorities and partners from different levels
Budget compliance	Extent to which annual expenditures are compliant and aligned to project cost projections
Sustainability and Transferability	Extent to which economic activities have generated revenues and social activities have benefitted beneficiaries long-term

Table 2-1: Governance indications and performance measures

Community Engagement Indicators	Performance Measures
Representative	Extent of engagement participation by stakeholder groups Increased participation of vulnerable groups
Trust	Extent of competence, integrity and dependability/reliability of the engagement process
Influence	Extent of effects of project participation on community participants, and of participants on design
Responsiveness and Communication Quality	Extent to which interactions with the public are timely, helpful, and clear
Accessible	Extent of engagement and technical tools available to ensure participation & feedback
Transformative	Extent of benefits to the community participants

Table 2-2: Community engagement indicators and performance measures

Platform Development Indicators	Performance Measures
Value Delivery	Extent the support platform is intelligent, as well as customizable to user needs Extent the implementation of prototype in homes of older adults is perceived as trouble-free and efficient Extent of acceptability, usability, and adoption by users of the VillAGE platform
Risk Management	Extent of privacy protection and protection of personal data
Resource Management	Extent to which the management of resources (budget, human capital, material) have been used
Performance Measurement	Extent the support platform tracks and records user feedback and corrects technical malfunctions Extent the platform is responsive to user's feedback

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Platform Development Indicators	Performance Measures
Strategic alignment	Extent to which the platform is aligned to user needs and challenge statement
Frailty	Screen for frailty
Acceptability	Satisfaction with various aspects of the innovation (content, complexity, comfort, delivery, credibility)
Adoption	Intention, initial decision, or action to try an innovation "uptake"
Appropriateness	Perceived fit, relevance, or compatibility of the innovation
Feasibility/Usability	Actual extent to which innovation can be successfully used for its intended purpose – based on effectiveness, efficiency and satisfaction, system usability scale
Fidelity	Delivered as intended based on protocol
Implementation cost	Marginal cost; cost effectiveness; cost-benefit
Penetration	Level of "reach" or spread or service access
Sustainability	Retention, maintenance or continuation by user

Table 2-3: Platform development indicators indications and performance measures

Service Delivery Indicators	Performance Measures
Quality	Extent of tangibles (reliability, responsiveness, assurance and empathy of service)
Availability	Increase access to and use of technologies
Revenue Improvement	Extent of price adaptability of service
Customer Experience	Extent of customer understanding of service Extent of customized services
Process Cycle (time, improvement)	Extent of waiting time
Digital Literacy – Older Adults	Extent of difficulty in adapting to wearables and other related smart technologies
Safety	Increased safety in the home (Safety Assessment Scale)
Perceived Physical and Mental Health	Extent of smart-home customer expressing improved physical and mental health
Increased functional Status	Ability to perform tasks necessary to live independently in the community (Lawton Instrumental Activities of Daily Living Scale)
Improved Communication between Seniors and Families	Extent of senior's family participation months after smart home devices installed
Increased Social Connections	Frequency and quality of family, friendship and neighbour ties (Lubben Social Network Scale)
Reduced Mechanical Falls/ Increased Falls Efficacy	Falls Efficacy Scale

Table 2-4: Service delivery indicators and performance measures

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 2 PERFORMANCE MEASUREMENT

Sustainability and Transferability Indicators	Performance Measures
Economic Performance	Extent of VillAGE smart home products and memberships installed Extent of revenue sources acquired from the VillAGE Initiative
Social Performance	Extent of social impact the VillAGE Initiative has on community and users of services

Table 2-5: Sustainability and transferability indicators and performance measures

Benefits to older adults	Performance Measures
Reduced Social Isolation (nodes of relationships to care map)	Quality and quantity of social relations with at different levels where human interaction takes place (individual, group, community and the larger social environment). Frequency of face-to-face human interaction
Social Participation	Extent of satisfaction with personal and family relationships and perception of loneliness
Quality of Life/Psychological Well-Being	Psychological General Well Being Index (Dupuy)
Prolonging Ability to Age in Place	Government checklist – Are You Ready to Age in Place

Table 2-6: Benefits to older adults indicators and performance measures

Benefits to Families/Caregivers	Performance Measures
Decrease in caregiver and family burden	Caregiver risk screen
Peace of mind/perceived stress	Extent of relieved stress of caregivers

Table 2-7: Benefits families/caregivers and performance measures

Benefits to City	Performance Measures
Increase in use of existing services	Internet access for percentage of lowest income and most isolated seniors
Increase social and economic resilience of older adults and community	Connection points in the community
Age-Friendly Community designation	Extent of following guidelines of Public Health Agency of Canada
Community capacity	Community capacity scale – social capital

Table 2-8: Benefits to City and performance measures

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 2 PERFORMANCE MEASUREMENT

Health and social service outcomes	Performance Measures
Reducing hospital admissions/ Reduction in priority 3 and 4 calls	EMS data (Hospital admission is costly and often preventable)
Efficiency of care	Better use and integration of community, city and the social and health care services (the right services at the right place at the right time at a reasonable cost) Just in time indicator

Table 2-9: Health and social services outcomes and performance measures

Benefits to Society	Performance Measures
Living Lab/Innovation Hub advancing knowledge (Knowledge translation, transferability) – interdisciplinary innovation	# of white papers written by researchers and organizations on VillAGE Initiative # of cities modelling the VillAGE Initiative for seniors in their territory
Changing Attitudes/Perceptions of Older Adults	# of positive, negative and neutral stereotypes on aging changed
Systems Change – New Resources, structures, new adjusted policies, improved delivery of existing programs and new working relationship in the community	# of resources, structures, adjusted policies, improved delivery of programs and new working relationship in the community changed
Ripples to Future Seniors	# of future seniors onboard the VillAGE Initiative platform
Inter-operability	Extent to which project has increased a community infrastructure that provides services to and accept services from other community and health care infrastructures and to use the services so exchanged to enable them to operate (CIUSSS DIGITAL HEALTH)

Table 2-10: Benefits to society and performance measures

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

2.3 PROJECT TIMELINES, DELIVERABLES, AND MILESTONES

The GANTT chart below focuses on timelines, deliverables, and milestones, which are easily measured and quantifiable.

Projects	Activities/Deliverables	Duration	Dependencies	Human Resources	Y1 Q1	Y1 Q2	Y1 Q3	Y1 Q4	Y2 Q1	Y2 Q2	Y2 Q3	Y2 Q4	Y3 Q1	Y3 Q2	Y3 Q3	Y3 Q4	Y4 Q1	Y4 Q2	Y4 Q3	Y4 Q4	Y5 Q1	Y5 Q2	Y5 Q3	Y5 Q4
Governance and Operations																								
	Create NPO and recruit Governing Board	6 months		Côte Saint-Luc (CSL)																				
	Establish Board rules, structure and framework	3 months	Create NPO	CSL																				
	Hiring CEO and Management Team	3 months	Establish rules	Governing Board (GB)																				
	Create policies and procedures	3 months	Hiring MT	Management team (MT)																				
	Establishing professional services	3 months	Create NPO	COO																				
	Financial plan and budget	3 months	Hiring MT	MT																				
	Sign contracts with Technology Partner	3 months	Professional services (PS)	MT, GB, PS (lawyer)																				
	Sign contracts with other partners	3 months	PS	MT, GB, PS (lawyer)																				
	Create HR management plan	3 months	Hiring MT	MT																				
	Create risk management framework	3 months	Hiring MT	MT, GB																				
	Establish outcome measurement plan	3 months	Hiring MT, partner contracts	MT, Research Partner																				
	Create data governance and privacy protection policy	3 months	Hiring MT and PS	MT, PS (Privacy expert)																				
	Develop marketing and communications strategy	3 months	Create NPO	MT, CSL																				
	Set up new location (service delivery and offices)	9 months		MT, GB, PS																				
Community Engagement/ Social Transformation																								
	Finalize CE Plan (including work with indigenous groups)	3 months	Hiring MT	DIR - CE/SD																				
	Create VillAGE Community App/neighbourhood development strategy	27 months	Finalize CE Plan	DIR - CE/SD, CEO, TP

Sustainability and Transferability																								
	Finalize sustainability plan (revenue model inc. user fees, grants, partnerships, etc.)	48 months	Hire Management team	MT, GB																				
	Create and implement fundraising plan	33 months	Hiring Fundraising	Fundraiser																				
	Lobby to expand PAD program to include Smart Homes Devices	21 months		CEO, CSL, RP																				
	Implement sponsorship and partnership revenue agreements	27 months		COO																				
	Create implementation and best practice guidelines for transferability	6 months	platform development, service delivery	MT, GB, RP																				
	Guidelines and framework for licencing VillAGE solution to other cities	6 months	platform development, service delivery	MT, CTO																				

Table 2-11: Implantation plan

2.4 PAYMENT SCHEDULE

The VillAGE Initiative will only be able to be established with the senior staff and extensive legal support in place, out of which everything else will flow. Most of the Governance and Operational set up will occur in the first year, so we would request the first payment to be 'seed capital' covering our first 12 months of operations in order to make that possible.

Outcomes-Based Performance Measurement - Milestones and Payments		Y1	Y2				Y3				Y4				Y5			
Category	Description	Seed capital	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4	Q1	Q2	Q3	Q4
Awareness of the VillAGE Initiative	This is the number of people that would gain awareness of the VillAGE Initiative through our marketing efforts to our population of approx. 34,000 residents.		5,000		5,500		6,000		6,500		7,000		7,500		8,000		8,500	9,000
Participation in Community Engagement	This is the number of people who reach out and participate in our Community Engagement activities.		200		300	350	400		500	550	600		650	750	800		1,000	1,250

Table 2-12: Outcomes-Based Performance Measurement with the milestones and payment schedule

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 2 PERFORMANCE MEASUREMENT

2.5 RISK STRATEGY AND MITIGATION

Risks	Mitigation Plan
Basing performance indicators only on quantitative data	Ensure that qualitative indicators are measured as well (through interviews, surveys, focus groups, and observation)
Lack of validity and reliability of outcomes	Ensure reliable and valid tools are being used and use multiple methods to triangulate the results.
Medium- and long-term outcomes may not be achieved for many years	Ensure service delivery starts on time Focus on showing medium- to long-term outcomes in sustainability plan.
Not being able to collect baseline metrics	Ensure evaluation tools are built into the platform on time
Not meeting timelines	Establish clear monitoring and reporting of deliverables based on dependencies Report on works in progress to the Governing Board on a monthly basis. Establish clear status reporting between Platform Development and Service Delivery

Table 2-13: Risks and mitigation plan

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 3 PROJECT MANAGEMENT

Proper project management will ensure that the people responsible for bringing the VillAGE Initiative to life stay on course and are accountable for delivering on the promise so awaited by our public. This chapter outlines a variety of strategies and tools for the organization to use related to resource assessment, risk identification and mitigation, communication and monitoring.

3.1 PROJECT SCOPE, SCHEDULING, SEQUENCING, AND DEPENDENCIES

The VillAGE Initiative consists of five main projects, with several activities outlined in each. The GANTT chart (Figure 2-11) in Chapter 2—Performance Measurement indicates the scheduling, sequencing, and dependencies for each activity, in addition to the human resources, and the schedule of deliverables/outputs.

3.2 RESOURCE ASSESSMENT

Human Resources

A Human Resources Management Plan will be created by the Management Team that will outline the following:

- Individual and team roles and responsibilities for each of the projects and who will be responsible for all the hires
- A recruitment strategy
- Onboarding procedures and documentation
- Job descriptions with performance expectations
- Team-building programs
- Training programs
- Development of policies and procedures
- Performance Assessment and roll out plan

During the implementation phase of the Governance & Operations project, the HR Plan will be used for the acquisition, onboarding, training, and development of human resources.

The Organizational Chart below (see Figure 3-1) illustrates the structure of the VillAGE Initiative. Closely mirroring the Organizational model (Figure 1-1), it ties the actual staff positions to Initiative activities. While the CTO technically has a separate technology team, they are included in this chart as they are funded by the Smart Cities Challenge, and will work very closely with the community engagement and service delivery teams. The roles of the Management Team are outlined in the Governance Chapter.

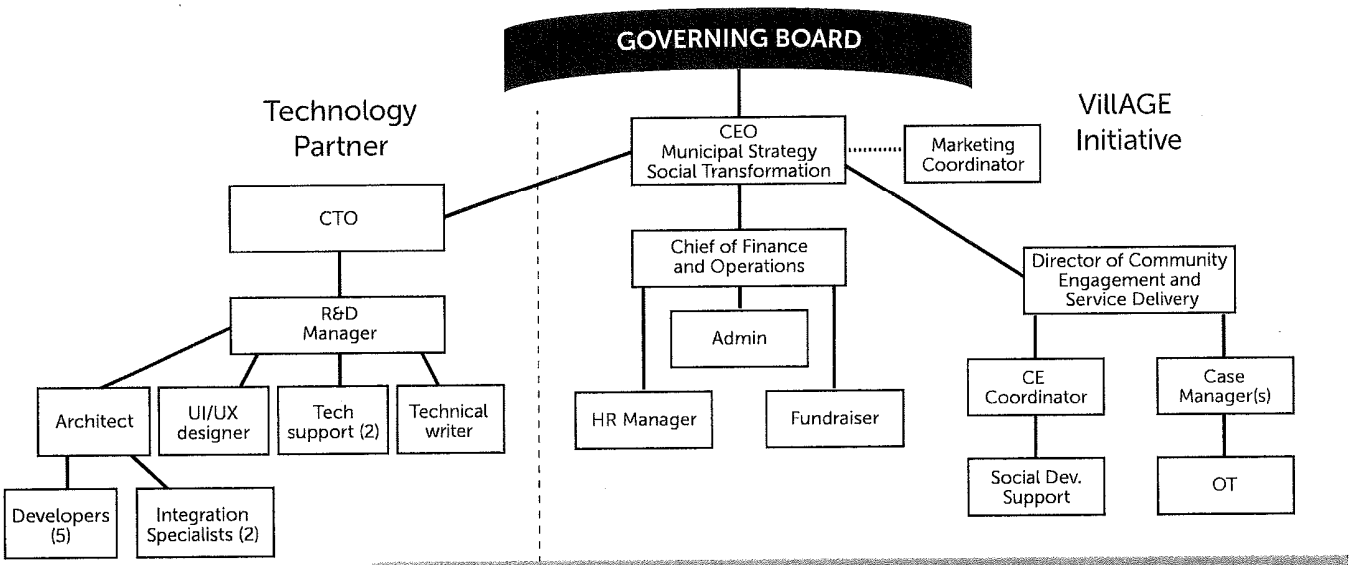

Figure 3-1: Organizational chart

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

3.3 MATERIAL & FINANCIAL RESOURCES

Many material resources will be provided by the City of Côte Saint-Luc. This includes IT systems, marketing and communications resources, space for community engagement, and office space for the first few years. The infrastructure for service delivery is also well-established within City departments, whose resources can be tapped when required. This includes the Library, the Parks & Recreation, Public Safety (including EMS and vCOP). All financial resources are explained in the Financial Chapter.

3.4 STRATEGIES

Risk Identification & Mitigation

A Risk Management Plan will be created by the Management Team in the first year that will outline the following:

Roles and Responsibilities for Risk management

- Methodology
- Risk categories
- A Risk Breakdown Structure (RBS)
- Cost Management Plan
- Risk probability and impact assessment
- Risk categorization
- Reporting formats
- Tracking

Each project lead will manage the risks for his or her project. See Monitoring, Controlling, and reporting section, below.

Following are the best practices we will aim to implement in mitigating risks:

- No rush planning; bringing all stakeholders to the table and get their commitment
- Create proper governance and support structure
- Assemble a dedicated team
- Make sure team members know their roles
- Create test environment
- Deliver larger projects in phases
- Get clients to test and create or modify existing business processes
- Plan for a bumpy data migration
- Create service-level agreement with client
- Blitz support on go-live date
- Monitor systems for 60 days
- Celebrate success and acknowledge the team
- Procurement Management

A Procurement Management Plan will be created by the COO that will outline the following:

- Procurement policies and procedures;
- Risk Management issues;
- Contract Change Control systems;
- Payments systems;
- Claims administration;
- Performance reports;
- Payment systems.

The CEO and Governing Board will review all contracts, as will, when relevant, the CTO and Director of Community Engagement and Service Delivery. Outside legal counsel will be required for every contract, as there is no lawyer on staff.

The largest and most important contract will be with the Technology Partner (CTO), who will be responsible for developing the technology procurement plan, solicitations, equipment purchases, contracts with partners and vendors, hiring and managing technology team, make-or-buy analyses, systems integrations, activity costing and more.

Stakeholders

Stakeholders are individuals who are involved in the project, or whose interests may be positively or negatively affected as a result of the execution of the project.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Stakeholder	Impact and Influence
Senior residents (age 65+)	This group is the target audience for the VillAGE Initiative. They have the most influence on all aspects of the project, and it impacts their lives the most. As a result of the Initiative, they will have more autonomy and be safer living at home and in community.
Families of senior residents	The people directly linked to the seniors are also extremely affected by the project and have a lot of influence on how it will unfold. They could gain tremendous peace of mind from the Initiative and also have their lives made easier if their loved ones are more autonomous.
Future seniors (age 40–64)	Those not quite senior yet will be able to reconsider their entire approach to aging in light of the VillAGE Initiative, and perhaps, with this increased awareness, use prevention to avoid negative outcomes in the future.
Participating residents	The notion of the VillAGE is to ideally have the entire community participate and help one another for mutual benefit thus strengthening the community as a whole. The impact of the group on the success of the project is important.
The City of Côte Saint-Luc	The City of Côte Saint-Luc, its residents, reputation, and demographics will be heavily impacted by the VillIAGE Initiative, which is game-changing for the municipality. The City itself will continue to have an extremely important and influential role in the project.
Technology Partner	This company and its president, who will be the VillAGE CTO, has a major influence on the project and all its outcomes. Its success depends on this partner.
Future Board members	This group will have significant influence on the direction of the VillAGE Initiative and will directly impact key decisions.
Future VillAGE staff	Those earning their livelihoods from the project will of course be impacted by it. They will have a major influence on its implementation and success, but also on the lives of the individuals who participate in it. Those who have worked on it so far have been transformed already, and will only be more so as they see it through.
Community partners	This group stands to benefit immensely from the VillAGE Initiative, and can co-develop programs and services with us. With social prescription and referrals, the project could even see their attendance numbers increase.
Research partners	The impact and influence of university research partners on the Initiative is already significant and will continue to be so. They have already helped shape the direction of the project, and will advise and co-create with us in the future as well.
Health and Social Services Centre	The strain of a rapidly aging population on these institutions is acute. The Initiative could have an immense benefit to and help alleviate the burden on the health system. The Initiative will complement rather than overlap with the services provided by these centres. Our partnership with them is highly valuable.
Hospitals	The hospital system is both a major beneficiary and major partner of the VillAGE Initiative. The project will improve the trajectories of care, and advance the objectives of the health care system, which is moving towards digital health and transferring care to where the patient is. The Initiative will also receive advice and expertise from this group.
Provincial government	The province has a major impact on this project in terms of support, funding, and direction. It will have a seat on the Board, and can, within its powers, shift the entire focus of health spending on prevention and programs such as this.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Stakeholder	Impact and Influence
Service providers to seniors	Several kinds of people fall into this category, and they are those that will be more indirectly affected by the project. This group includes: pharmacists, taxi drivers, transit services, and gardeners, but also companies like Lifeline, security companies, etc.
City staff, especially those who work in the Library, Parks & Recreation, Public Safety (including EMS & vCOP)	Many in this group will be heavily impacted by the VillAGE Initiative, in that new programs, services, and standards will need to be created, adapted, or adopted by them.
Building operators	If the VillAGE Initiative is successful, building operators (including superintendents) may have a more significant role to play in the lives of their tenants. They can opt to install smart technologies, receive alerts, and also impact social activities in the building.
Senior residence operators	These operators will be both positively and negatively impacted by the VillAGE Initiative. People living in their homes longer means they don't move into these facilities, but on the positive side, they could make excellent partners for deploying technologies and augmenting their services.
Emergency Response Services (Ambulance, Fire, Police)	The Initiative will definitely have a positive impact on these services, because prevention is a major part of what it's about. They will be better able to do their jobs if we succeed.
MEDTEQ	This consortium will have definite impact on the project, especially in the realm of funding. With funding will come a measure of influence.
Tech companies who create tools	Any variety of businesses who develop technology tools for seniors could benefit from this project, especially those open to working with us. Some will see the Initiative as competition, but most could co-develop new products with us and test them with our target population.
Other cities	Other cities (nearby and not) can be both positively and negatively impacted by the VillAGE Initiative. The project may create expectations in their populations that they may not be able to meet, and if any responsibility for health is devolved to cities, it will definitely impact both their budgets and operations. Other cities also stand to gain from the project, as the knowledge and technologies will be openly shared with them.

Table 3-1: Stakeholder impact and influence

Communications

Project Communications Management involves the creation of a Communications Strategy, which will include:

- Stakeholder register
- Stakeholder communication requirements
- Stakeholder Management Strategy
- Information to be communicated (including language, format, content)
- Communications distribution channels (e.g. emails, press releases, social media)
- Communications technology
- Communication requirements analysis
- Communication models and methods

A Marketing and Communications Coordinator will be responsible for all VillAGE Initiative communications and the creation of the Plan. This person is linked to the CEO but reports to the Director of Public Affairs, Communications and IT in the City

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

of Côte Saint-Luc. The reason for this structure is that the City is providing many in-kind donations related to marketing and communication, and so it made more sense to have a resource dedicated to the VillAGE Initiative on that team.

3.5 MONITORING, CONTROLLING & REPORTING STRATEGIES

Each project lead will manage their project scope, time, cost, quality, human resources, and risk management. This includes:

- Defining and sequencing activities
- Estimating the resources required
- Estimating the duration of each activity
- Developing and controlling a schedule
- Estimating costs
- Determining and monitoring a budget
- Performing quality assurance and quality control

Where the Management Team is designated as responsible in the GANTT chart, the CEO will ensure that the activity gets completed.

Issues may escalate in certain areas of our project plan. To address them, an 'issue log' will be instituted. The log will manage the status, level of importance or priority, provide a description of the issue, a resolution timeline, possible escalation and evaluate the impact it may have on a project or other dependencies as well as indicate who will be responsible for managing it. The log will be accessible and archived when completed on the VillAGE Intranet management system.

For the closure of each activity, 'lessons learned' documentation will be created, which includes variances, corrective actions taken and other relevant information.

The culture of the VillAGE Initiative as an organization must be one that accepts failure as a means of learning, without which innovation and best practices will not occur. As long as failures are acknowledged as they occur, discussed, documented, and corrected, the Initiative will move forward.

Project Reporting and Communication

We will provide regular reports and communications to various stakeholders and partners of the VillAGE Initiative such as monthly status updates, regular reviews, and as-needed communication to keep them informed.

Quality Assurance and Quality Control

To monitor and verify the effectiveness of processes used to manage and create the deliverables, we will be using a Quality Assurance software solution like TestRail. It is an easy to use web-based QA tool that integrates task lists and time tracking module solutions to organize test cases, execute tests, collect results, and coordinate testing efforts. TestRail also lets you automatically project past estimates and actual time spent into the future to predict workload more accurately. Project dashboards and email notifications keep you informed throughout your testing. All activities and test results are archived so that you always have a detailed history available for your reference. Each project manager with his team will be responsible for tracking and testing their activities for Quality Assurance.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 3 PROJECT MANAGEMENT

3.6 KEY RISKS

Risks	Risk Mitigation Plan
Unavailability of human resources/skill gaps	• Get the right team by using resource allocation techniques and secure them when they are available
Achievement Requirements	• Clarifying requirements by holding workshops • Interviewing stakeholders • Producing a comprehensive scope document and project brief
Lack of communication between key stakeholders, project managers, customers	• Plan our communications and include all key stakeholders, managers and consumers
Schedule coordination	• Appoint a coordinator responsible for ensuring proper coordination of activities and their dependencies across the projects • As a secondary role, the coordinator will ensure project managers work collaboratively to improve efficiency and effectiveness
Delays in project start-up/execution	• Produce a development chart to measure delay and milestone slips of all projects to stay on track and on budget
No Plan B when Unforeseen Problems Happen	• Plan risk responses • Prepare an alternative plan which includes • Contingency fund • Additional resources on standby • Options to break the project into segments and/or reduce scope
Stakeholders disappointed	• Create Stakeholder register • Stakeholder communication requirements • Create a Stakeholder Management Strategy that sets the expectations from the very start.

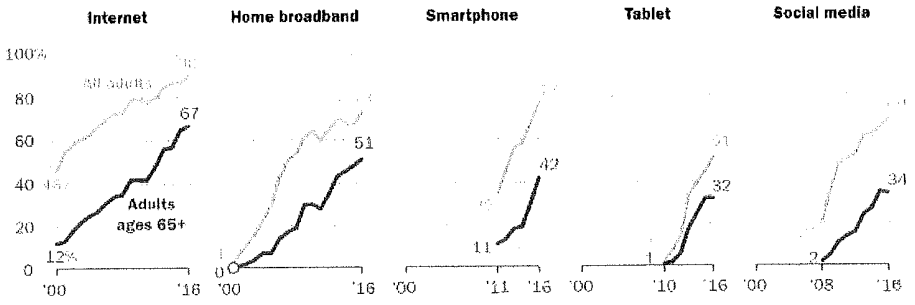
Table 3-2: Risk mitigation plan

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 4 TECHNOLOGY

4. THE TIME IS NOW

We live at a time where older adults can benefit from technology that improves their quality of life at home and in community. This has been made possible by advances in smart devices, data science and system interoperability. This technology has reached a maturity where it can provide older adults with more confidence, convenience, safety, and social connectedness.



4.1 TECHNOLOGY ADOPTION AMONG OLDER ADULTS IS GROWING

Contrary to popular stereotypes, older adults are adopting technology at a growing and rapid rate. Recent Pew Research Center surveys[2] found that 42 percent of adults ages 65 and older own a smartphone—up from just 18 percent in 2013—and 67 percent use the Internet and home broadband—a 55-percentage-point increase in just under two decades (see figure 4-1).

4.2 A FAST-GROWING TECH SECTOR IN THE LONGEVITY ECONOMY

The Longevity Economy is expected to grow to more than $30 billion in the next few years[3]. Families, caregivers, and older adults will increasingly be acquiring new tech-enabled services that improve the quality of their lives. The 50+ market is increasingly aware of technology alternatives. The desire to live at home dominates the minds of the city-dwelling baby boomers who began turning 72 in January 2018. Health costs rise and health policy drives care into the home. Stark consumer economic realities prevent moves to senior housing and life expectancy at age 65 still substantial, especially for women.

There are four main categories of technology for aging in place (see figure 4-2). Each useful in itself—but together, they provide a complete, albeit complex puzzle for maintaining connections, safety, health, and a more fulfilling and interactive life as we age.

Source: Survey conducted Sept.29-Nov.6, 2016. Trend data are from previous Pew Research Center surveys.
"Tech Adoption Climbs Among Older Adults"

PEW RESEARCH CENTER

Figure 4-1: Charts showing smartphone, Internet, tablet, and social media adoption amount older adults.

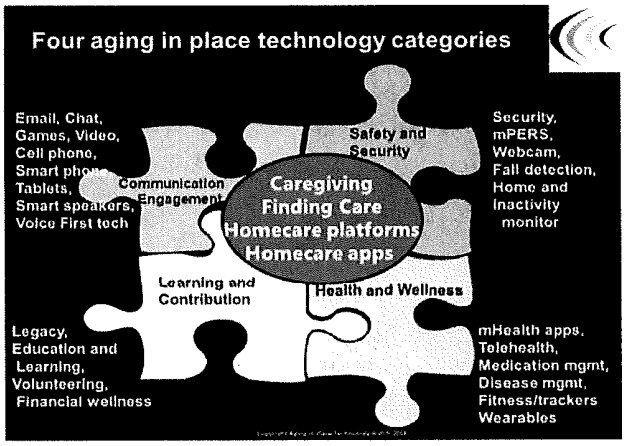
[3] The 2018 Market Overview from Aging in Place Technology Watch https://www.ageinplacetech.com/files/aip/Market%20Overview%202018%20Final%2003-14-2018.pdf

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information



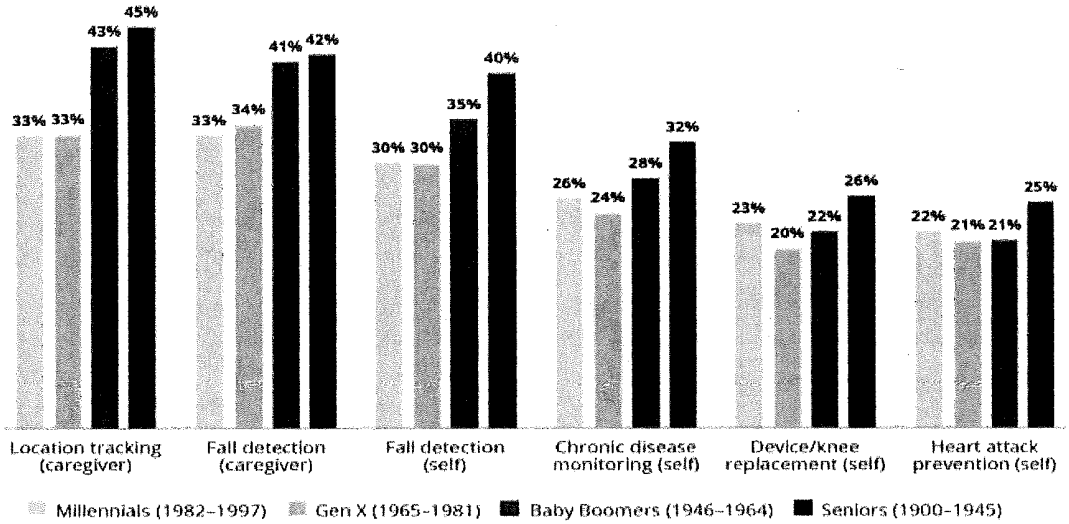


Figure 4-2: Aging in Place Technology Categories

The Personal Emergency Response Systems (PERS) market alone is expected to reach $3 billion in 2019[4]. PERS device firms include Nortek, MobileHelp Smart, and TruSense. Modified interface solutions for older adults are available from GreatCall (acquired by Best Buy) and GrandPad. Wearables, which include health-related sensors, began to take the stage in 2017 and early 2018, including UnaliWear, Clairvoyant Networks, and MyNotifi. Health and wellness solutions include Kardia Mobile for EKG, Misfit Vapor smartwatch for sleep tracking, and PillDrillHub, AdhereTech, and MediSafe for managing medications. Voice-first interfaces such the Alexa or Google Assistant provide hands-free in-home engagement. The CareCoach puppy and Hasbro's Companion Pets focus on providing companionship for and serving the elderly. These solutions represent a very small fraction of the overall fast-growing market.

We find it interesting that older adults and Baby Boomers are more likely to use sensors and other passive technologies than younger generations (see figure 4-3).

The number of technology vendors and solution options available is enormous, complex, and ever-evolving. It has become confusing to navigate for older adults, their families, and caregivers. The landscape is highly siloed, solution sets can be very costly, adoption is difficult, integration is challenging (if not impossible in most cases), and privacy issues present very legitimate concerns.

Source: Deloitte 2016 Survey of US Health Care Consumers.
Note: Chart shows respondents who are likely to use the technology, where "likely" is defined as answering "4" or "5" on a five-point scale in which "1" is "not at all likely" and 5 is "extremely likely."

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4.3 THE FINALIST PHASE—ENGAGEMENT, RESEARCH, AND PILOT

During the finalist phase, we:

- consulted with residents during community engagement to discover their experiences, needs and concerns associated with technology
- researched and evaluated existing technologies and solutions
- implemented a pilot project in the homes of five residents (described in Chapter 6—Engagement)
- defined a vision and plans for our Connected Technology Framework—The VillAGE Platform

4.3.1 Requirements Derived from Community Engagement

We discovered a broad set of older adult resident needs during our community engagement initiatives (see Chapter 6 - Engagement). From a technology implementation perspective, we categorize these needs as follows:

- Tech for **convenience**, focused improving experiences with day-to-day tasks and addressing challenges associated with cognitive and physical decline.
- Tech for **safety**, addressing challenges associated falls, water overflow, air quality, etc.
- Tech for **social connectedness and engagement**, focused on facilitating community interactions using digital channels and addressing challenges with social isolation.

Through discussions with the community as well as with our university research partners, we discovered how critical it is for our project to deliver **core solutions that offer simple and convenient user experiences with device interactions that are highly-adapted to older adults** and their lifestyle, both **at home** and **on the go**. These could include the following:

- **Sensors** and other passive devices and technologies
- **Voice and conversational assistants** offering a dialog-based approach
- **Touch interfaces** such as tablets, smartphones, and wearables which are easy to use, intuitive to operate, and that cover a wide range of needs
- **Wearables**, such as smartwatches—which are preferred to pendants—that integrate nicely into daily living and that offer a wide range of features
- **Smart automation**, at home or on the go, providing assistance based on intelligent situational analysis (e.g., using data science, AI, etc.), device integration, configurable workflows triggering alerts, actions, responses
- **Seamless integrations** across devices and to the City, community, and partners

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4.3.2 Research and Evaluation of Existing Technology Solutions

We researched and evaluated a number of existing technology vendors and solutions during the finalist phase that might have fit our older adult residents' expressed needs, either as core or satellite solutions. The following table highlights many of the existing technology solutions we researched and evaluated.

Vendor/solution	Description
Essence Care@Home™ Enhanced Telecare Services Platform	An Aging-in-Place product suite that offers a seamless health monitoring experience, allowing independence for older adults and peace of mind to their loved ones. **https://www.essence-grp.com/smart-care**
InteliCare	Based on sensors, the InteliCare solution is designed to support people to remain in an independent living environment for longer, whether this be within their own home, a retirement village or in an aged care facility. **http://intelicare.com.au/**
Aerial	Aerial Technologies uses artificial intelligence to analyze disruptions in WiFi networks, extract data, and ultimately give meaning to motion (including fall detection), without requiring additional hardware, wearables or cameras. **https://www.aerial.ai/**
Elemental Core	A social prescription platform based in the UK offering Health Risk Analysis, Social Prescription Generation, Health Impact Measurement, Calendar, Attendance Tracking, Reports, Campaigns, and more. **https://elementalsoftware.co/platform/**
Laipac Look Watch	An elegant, standalone, and feature-rich IoT smartwatch for safety, health and wellness. **https://www.laipac.com/smartwatch.html**
Routinify WellAssist™	Tablet and IoT sensor-based solution providing for an environment of Adaptive Routines™ to create and reinforce positive habits with the goal of improving wellness, safety, social and mental engagement, and security. **https://www.routinify.com/**
ElliQ	An AI driven social companion robot aimed at keeping older adults sharp, connected and engaged. CES 2018 Best of Innovation Winner. **https://elliq.com**
Elizzbot	On-demand Smart Chatbot for Family Caregivers. **https://elizz.com/landing-page/elizzbot**
UBIOS	Smart building solution primarily focused on preventing water damage via sensors. **https://www.ubios.ai/**
Amazon Echo and Alexa	Smart speaker and voice-controlled intelligent personal assistant service by Amazon. **https://developer.amazon.com/alexa**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Vendor/solution	Description
Apple Watch	Smartwatch by Apple Inc. It incorporates fitness tracking and health-oriented capabilities with integration with iOS and other Apple products and services. **https://www.apple.com/healthcare/apple-watch/**
Université de Sherbrooke DOMUS laboratory solution (DOMUS)	The Université de Sherbrooke DOMUS laboratory developed a smart home solution for older adults primarily based passive sensors and open technologies for research purposes. **https://www.usherbrooke.ca/domus/en/**

We considered and evaluated solutions according to our Technology Evaluation Criteria for The VillAGE Initiative, which is covered in the next section.

4.3.3 Technology Evaluation Criteria for The VillAGE Initiative

We have a responsibility to deliver simple, safe, private, and affordable solutions to our community. Given the high number of characteristics that any individual solution and vendor might have, and based on what we learned in community engagement combined with our market research, we developed our definition of **Technology Evaluation Criteria for The VillAGE Initiative:**

Category	Evaluation Criteria
Relevance	• Is the solution's feature and capability set relevant to older adults? • Was the solution developed for a broader population and, if so, does it fit older adults?
Readiness	• Where is the solution in the readiness and maturity lifecycle? • How much of it is ready to deploy? • Is the solution proven with real-world deployments?
Simplicity	• Is the solution simple and intuitive to use by older adults?
Adaptability	• Is the solution configurable to meet individual older adult needs? • Does is the solution extensible by outside parties to meet key older adult requirements?
Smartness	• Is the solution smart (if applicable), providing intelligent assistance to the user?
Privacy	• How does the solution manage private data? • Where does the vendor reside? • Where does data reside? • Is the data shared with partners? • Is the solution transparent enough for a third party to validate data management and flow?

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Category	Evaluation Criteria
Security	• Does the solution implement relevant best practices around security (authorization, encryption, etc.)?
Compliance	• Does the solution comply with applicable standards and certifications?
Interoperability	• Does the solution provide adequate and sufficient interfaces for interoperability with other systems (data integration, UI integration, etc.)? • Are there any limitations that would prevent the solution from being integrated with our partner ecosystem today or in the future (health-care, research, or other)?
Manageability	• Are heavy services needed to deploy and implement the solution? If so, what are the required skillsets and where could they be sourced from? • Is the solution itself difficult to implement and manage/monitor/maintain over time?
Replicability	• Are the any limitations (geographic or other) that would prevent the solution from being deployed to other cities?
Sustainability	• Does the vendor have strong financial backing? • How would the solution adapt to technological change?
Scalability	• Are there any limitations that would prevent the solution from scaling to thousands or even millions of users?
Affordability	• Is the solution affordable for older adults across varying income categories?

We evaluated the vendors and solutions using this criteria. We retained solutions that satisfactorily fit a sufficient number of our criteria and implemented them in our pilot project (described below). This included the DOMUS solution and the Laipac Look Watch. We added and integrated Amazon Echo to test voice assistance.

Our technology evaluation criteria would be used to vet solutions in our full program implementation of The VillAGE Initiative, giving our residents confidence that we are taking a holistic, safe, and efficient approach that has their best interests in mind.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4.3.4 Our Pilot Project

In January 2019, we launched a 4-month pilot project with five older adult participants living in Côte Saint-Luc (details on our subjects are covered in Chapter 6—Engagement). We used technology solutions that sufficiently satisfied our above-mentioned Technology Evaluation Criteria for The VillAGE Initiative. The goals of our pilot project were to begin experiencing and testing the following:

- resident interviews for needs assessment
- at-home installation of technology
- resident acceptance of technology
- solution monitoring and results
- resident feedback

We implemented the following technology:

- The DOMUS smart home solution (from Université de Sherbrooke) with connected Amazon Echo (Alexa)
- The Laipac Look Watch

4.3.4.1 The DOMUS Smart Home Solution

Since 2002, the DOMUS (DOMotics at the Université de Sherbrooke) laboratory has been studying cognitive assistance, medical monitoring and televigilance for people with cognitive disorders. The results of the research performed at DOMUS are applicable to people with cognitive deficits due particularly to head trauma, schizophrenia, Alzheimer's disease and cognitive impairment.

Based on their extensive expertise with advanced cases of cognitive decline, DOMUS has developed over 16 years a standard approach for older adult research in Quebec. To support their work, they have developed a smart-home-for-older adults technology platform using **open technologies**. The technology largely consists of passive sensors that integrate well into an older adult's every-day living. The technology is mature and setup only takes a few hours per home, which in large part is why we selected it. Also, DOMUS is university research lab, which gave us the confidence that privacy and subject consent were being taken very seriously.

In the DOMUS solution, small passive sensors (e.g., motion, water, door, drawer, appliance, etc.) capture and send raw activity data to a small computing hub in the home. The hub analyzes it, understands it, makes decisions, and produces actions or responses. The hub also sends data to a configured server to record activity, assemble activity patterns, and integrate with external systems.

With the DOMUS solution, a bed pressure sensor could detect an older adult getting up at night and trigger a response, such as turning on the bedroom lights, which reduces the risk of injury. A water sensor in the bathroom would detect whether the faucet was turned on, and generate a reminder in case the older adult forgets to brush their teeth within a set time. These are just some of the many ways technology can used.

The DOMUS solution is based on open technologies, including openHAB as a controller for the home hub—typically running on a very low-cost Raspberry Pi. It also supports smart home data communication and interchange protocols and standards such as MQTT, ZigBee, Z-Wave, which makes the architecture very attractive from an interoperability, extensibility, transparency, privacy, and affordability perspectives.

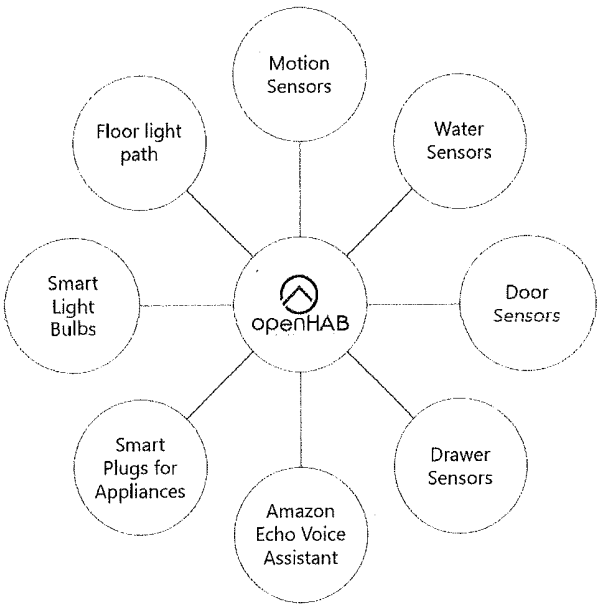

Figure 4-4: Chart showing eight examples of sensors or smart technology that connected with the openHAB-based home hub during our pilot.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

During our pilot project, we installed low-cost motions sensors (Fibaro), water sensors, door and drawer sensors (Fibaro), smart plugs for appliances (Aeon Labs), smart lightbulbs (Philips Hue), and a floor light path (Philips Hue). We also installed one Amazon Echo unit per home to enable participants to use voice commands to operate lights (e.g., "Alexa, Lights On") and to access information and entertainment, such as news, weather, and music.

Figure 4-5: Photos of the smart device installation in a pilot particiant's home.

The DOMUS solution experiment also gave us a chance to experience the benefits of Augmented Reality (AR). Using Microsoft HoloLens—which is a virtual reality (VR) headset with transparent lenses for an augmented reality—we were able to capture and generate the map of a home or apartment that includes placement of and activity from smart devices. The approach offers great capabilities for remote monitoring and troubleshooting.

Figure 4-6: Photos of the HoloLens capture and generated map of pilot participant's home.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4.3.4.2 Laipac Look Watch

In addition to the DOMUS smart home solution, we also implemented the Laipac Look Watch, which is an esthetically-pleasing, full-featured Android-based IoT smartwatch. Core features for older adults include tracking and monitoring, geofencing entry and exit alerts, heart rate monitoring, fall detection, SOS button, check-in feature, watch removal alert, two-way voice communication, and more.

We configured and trained pilot participants on how to use the watch. In the event of a fall or after manually pressing the SOS button, the watch would automatically alert family members, friends, or project volunteers. We used the Look Watch's backend software to deploy configurations (e.g, contacts, reminders, etc.) and track pilot participant activity, including any detected incidents.

4.3.4.3 Pilot Project Results

Our pilot project is scheduled to run until May 1, 2019. At the time of this writing, we are able to report results based on two months of activity in collaboration with our research partners. On an aggregate basis (to protect privacy), our pilot system generated activity reports for us and pilot participants to learn from. See Appendix for activity reports from the pilot project.

Figure 4-8: Photos of Laipac Look Watch used by pilot participant.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4.4 THE VILLAGE PLATFORM

We learned a lot from our community engagement, market research, pilot project, and collaboration with partners. These learnings have led to the development of the vision and architecture for our Connected Technology Framework—**The VillAGE Platform**. This will help us meet the objective stated in our Challenge Statement.

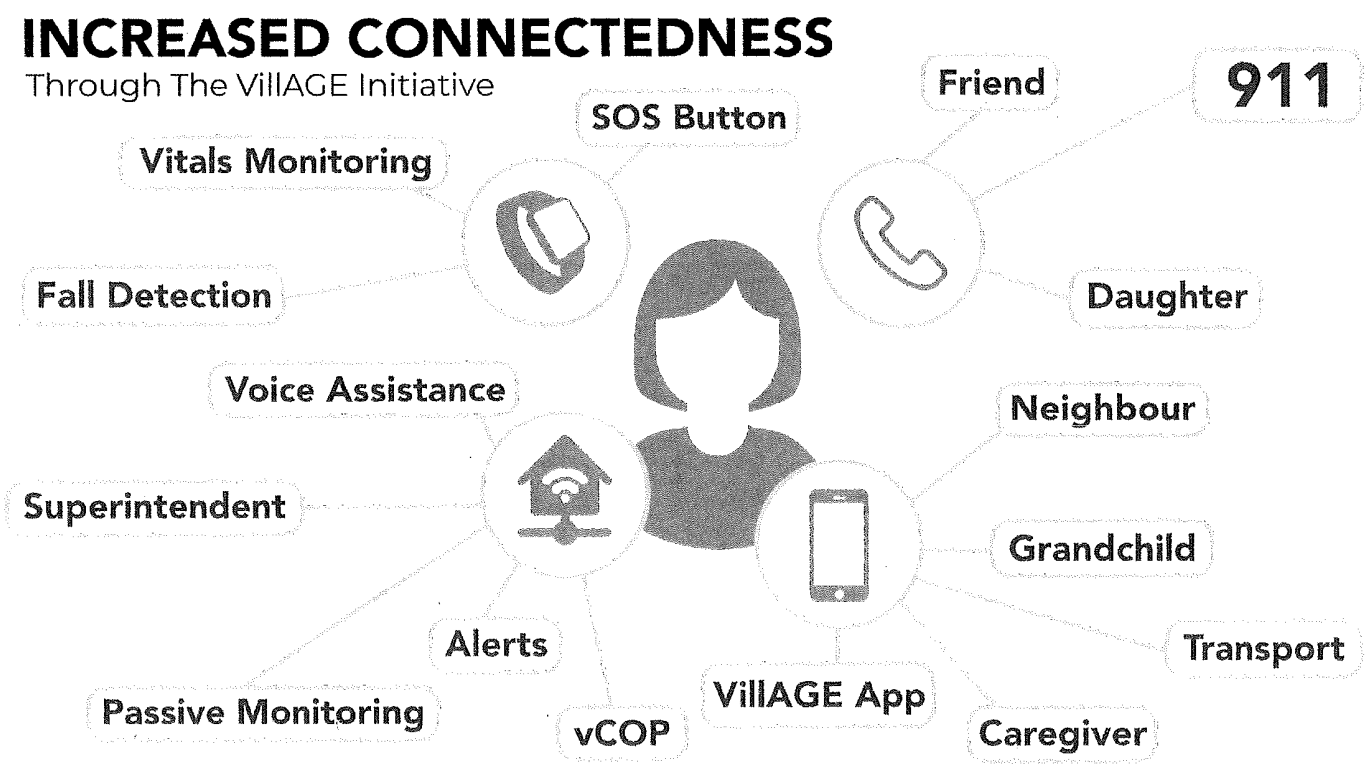

Figure 4-9: Graphic illustrating how the VillAGE Initiative will increase opportunities for connectedness for older adults.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

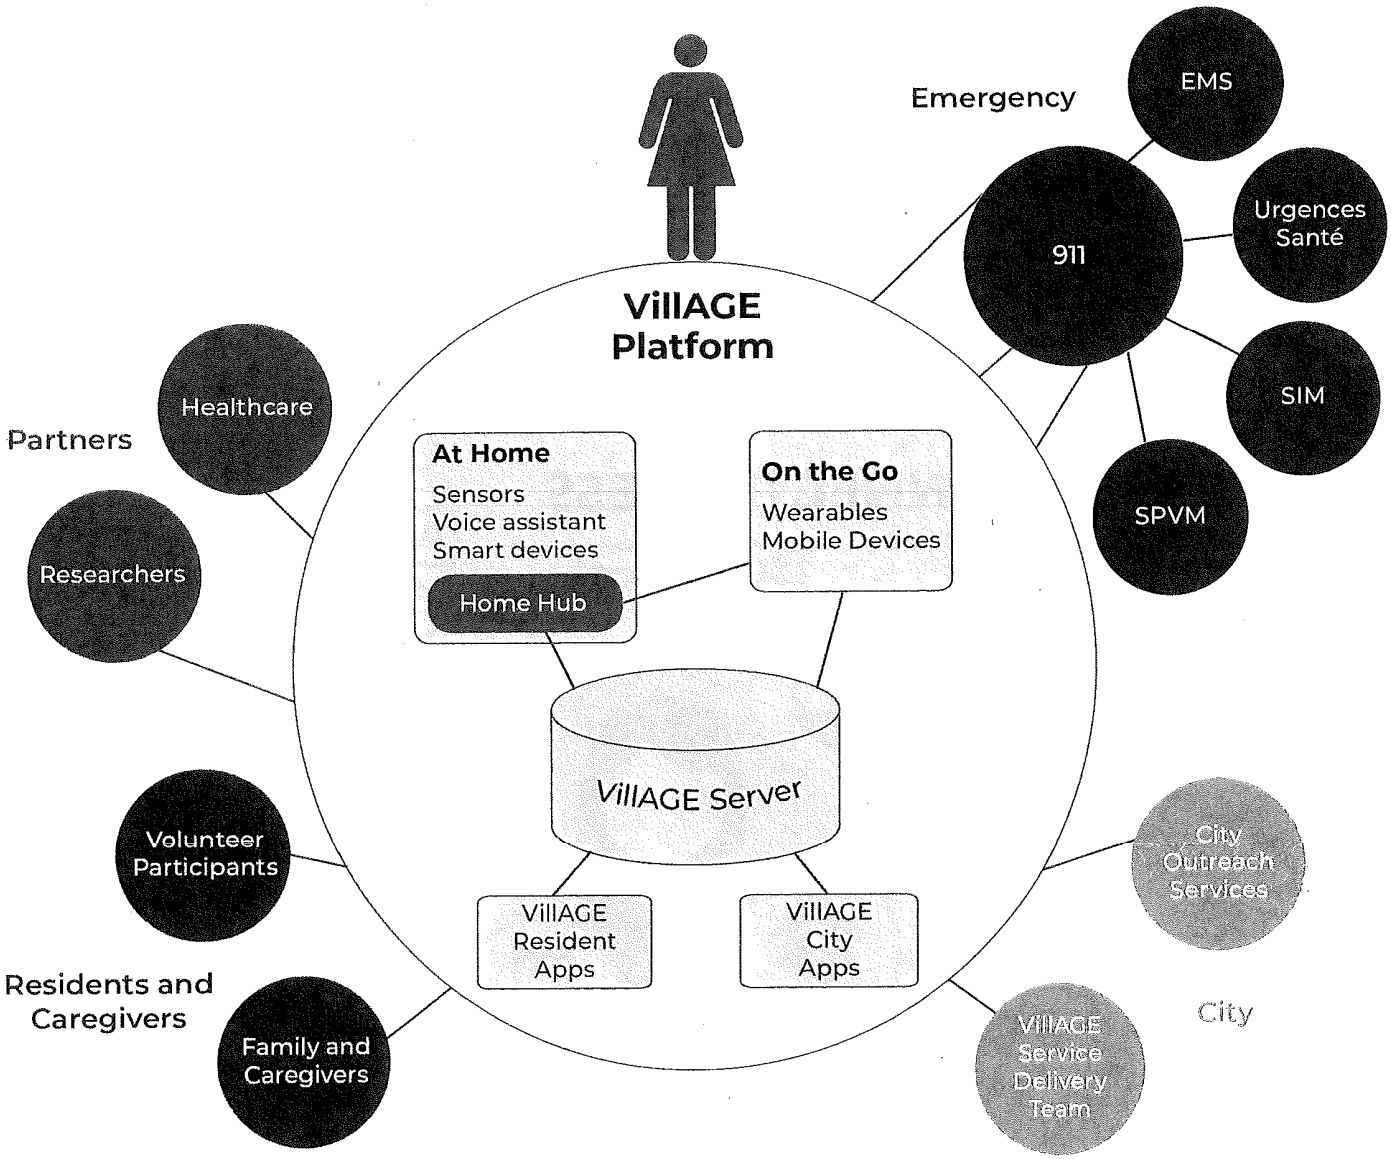

Figure 4-10: The diagram describes the flow of data emanating from alerts generated by the Home Hub and On-the-Go smart devices. Alerts will be transmitted to designated individuals (e.g., family, caregivers, according to the participant's instructions) and/or City services. In the case of an emergency incident, alerts would be sent to 9-1-1 and related services, as well as to residents and caregivers according to the participant's instructions. In the case of soft alerts, the information will flow to the VillAGE Home Hub and VillAGE Server, City Outreach Services and Service Delivery teams. Information would be provided to healthcare and research Partners in accordance with participants' consent.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

With a focus on providing more convenience, safety, and social engagement, the VillAGE Platform will allow older adult residents to access resources for help when they need them. The following table illustrates examples.

Category	Scenarios
Convenience	• A bed pressure sensor could detect an older adult getting up at night, and turn bedroom lights on automatically, reducing the risk of injury. • An older adult could use a voice assistant to get information on the news, weather, or social programming from the city on any given day.
Safety	• An older adult could experience a fall. A smart device could detect the incident, and trigger an alert to city services or even better, to someone who might be physically closest in the moment, helping with a faster response. • An older adult could leave the stove on. A level of response could be anything from a device that automatically shuts it off, to a call to check in on the situation, making sure the resident and those around her safe and sound.
Social Connectedness and Engagement	• An older adult could receive reminders while at home of upcoming activities at the library or local theatre, and a lift could be arranged. • An older adult might need help with a challenging task, such as salting a walkway. The older adult could broadcast the request using a voice assistant and a nearby neighbour who is connected using the VillAGE App, could receive and fulfill the request.

4.4.1 Platform Architecture

Our guiding architectural principles for The VillAGE Platform are the following:

- Open technologies
  - Core system based on open technologies, favouring transparency, extensibility, future-proofing, affordability, and replicability
  - Large developer community, reducing the risk of being short on resources
- Great experiences at home at on the go
  - Easy-to-use technology solutions wherever the resident is that add value to an older adult's daily living, connected to applications for the community and city
- Smart automation
  - Intelligence to assess situations
  - Smart, configurable automation and workflows to process actions and responses
- Interoperability
  - Seamless interoperability and integrations between devices, the city, and partner systems (based on consent)
- Privacy and security
  - Seamless interoperability and integrations between devices, the city, and partner systems (based on consent)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

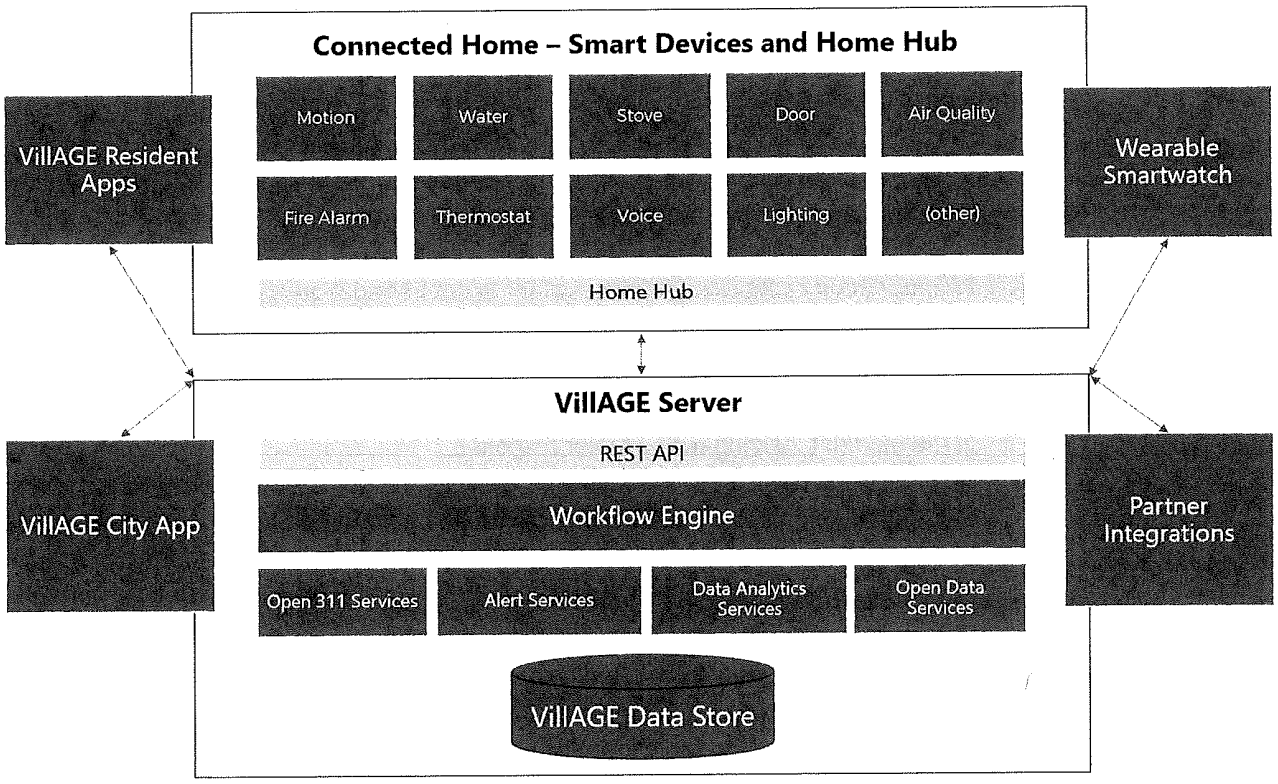

Figure 4-11: Illustration of the VillAGE Platform Architecture.

4.4.1.2 Connected Home—Smart Devices and Home Hub

Similar to what we implemented in our pilot project, various sensors and smart home devices would connect to the Home Hub for events, such as motion detection, water detection, voice commands, or others. These events would be **tracked, understood, processed**, and made to **trigger actions or responses**.

The Home Hub will be based on openHab, a mature, open-source home automation platform that runs on a variety of hardware and is protocol-agnostic. This means it can connect to nearly any home automation hardware on the market today.

The Home Hub will integrate with devices using a wide range of protocol bindings supported by openHab, including but not limited to MQTT, ZigBee, and Z-Wave. The Home Hub will also include or integrate with a reasoning or decision-making engine, which will be based on simple decision trees, ontological rules (OWL), and/or more advanced data science- or AI-based framework such as TensorFlow, which is an open source machine learning framework, based on requirements for "direct vs nuanced" interpretations of device activity and response requirements. The Home Hub would send information, based on resident consent, to the VillAGE server for processing, recording, and integrations outside the home.

Given reported privacy issues with popular voice assistants such as Amazon Alexa and Google Home, we would consider implementing an open technology-based solution using Mycroft or Snips.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4.4.1.3 Wearable Smartwatch

We will continue our work with Laipac on their leading-edge Android-based Look Watch to develop it further for older adults and to integrate its core capabilities for older adults (e.g, vitals monitoring, GPS positioning, fall detection, two-way voice calls, etc.) into the VillAGE Platform.

4.4.1.4 VillAGE Resident Apps

We will implement an older adult-adapted smart home controller app, **The VillAGE Home Hub Panel App**. Based on HABPanel, openHab's open-source user interface software will allow residents to be able to interact with and monitor their smart home devices using **a single touch interface for all VillAGE devices** installed in the home. Based on open technology, non-VillAGE devices (such as a smart TV) could be added to the Hub Panel App as well. The panel solution could be fixed on a wall or could be used on a mobile device, depending on the preference of the older adult.

We will also develop **The VillAGE Community App**, a simple-to-use app for residents, families, and caregivers. This mobile app will allow them to stay connected to the older adults they care for. The VillAGE Community App will allow people to "subscribe to" or "follow" events and requests from specific older adults in the community. For example, a volunteer might request to be notified if her older adult neighbour in an apartment two floors down has fallen or needs help with a task.

The VillAGE Home Hub Panel App and The VillAGE Community App will include Jitsi, an open source videoconferencing solution. This will facilitate live discussions with other community members. We are also considering **Rasa**, an open source conversational AI platform.

4.4.1.5 VillAGE City Apps, Workflow Engine, and VillAGE Data Store

City Outreach and Service Delivery teams will use the **VillAGE City App**, an enterprise application that will manage all backend functions such as:

- Older adult resident registration, profile, and contact management
- Case management
- Device order tracking and system configuration
- Monitoring and service calls

The platform will also include a **Workflow Engine** for server-side processing of older adult activity to produce responses (such as alerts to the right parties).

We will develop the VillAGE City App and Workflow Engine with JOGET, which is an open-source workflow software, business process management and low-code application platform. Among other database engines, JOGET supports MySQL, an open source database we will use for the **VillAGE Data Store**.

4.4.1.6 REST API

The **VillAGE Server** will be accessible via a **REST API**, which will be implemented using an open framework such as Node.js, that will cover the totality of our backend services. Together with our JOGET-based workflow engine—which itself generates REST APIs—this will make our system highly interoperable.

4.4.1.7 Open311 Services

Open311 systems are used in many cities including Ottawa and Toronto for a wide range of city services including alerting city workers to problems with garbage collection, illegal parking, and vandalism. We will instead use the same concept to trigger emergency services, in-home visits, check-in phone calls, and other interventions.

Open311 Services is our extension to Open311, which is protocol that advertises what services are available and what data is needed to access those services. It is very easy to connect with any mobile device or networked system. It typically identifies who is requesting a service and where they are located using GPS or other geospatial data.

Our system will leverage JOGET to create an Open 311 system. Open311 SDK is a REST API standard that has been used throughout Europe and parts of the US to integrate smart city services with a building-block approach.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4.4.1.8 Open Data

Our process model is clearly defined and will be shared openly with the city so that the process is clear and verifiable. Any metrics and KPIs of the project that are not of a private nature will be shared on a VillAGE dashboard that citizens can use to see summaries of data. Wherever possible, raw data will be available as open data, provided that the sharing of that data constitutes no breach of privacy of any individual or organization.

The nature of our system is to analyze individual needs of older adults, which results in private data. We then prescribe solutions to their specific issues and problems to help them link city, volunteer, family and private services, the services of each, which we clearly explain to each participant. We then use sensors, and IoT devices to establish a custom solution for the individual and set up data monitoring, which is completely private.

While the private nature of the raw data permits us only to publish data that has been anonymized and analyzed, the analytic results shall be open in every regard as long as no person can be recognized by that data or have their privacy violated. Role-based access to the data ensures that all databases have field-level access only to data for which the role is allowed access.

4.4.2 Replicability and Scalability

Our system is entirely comprised of technologies that are open source, with inexpensive off-the-shelf devices, capable of being run securely on inexpensive hardware with high security.

The most cost-efficient way to create this system is to divide it into two parts—the Smart Home and the Backend Server and address each separately.

4.4.2.1 Smart Home Solution Replicability and Scalability

The Smart Home can be assembled with three components: a Raspberry Pi running OpenHab as the hub, a Z-Wave Gateway USB stick, and a variety of off-the-shelf sensors and actuators. We listed the devices used in our pilot project. Regardless of the supplier, this basic home system will work as the majority of IoT suppliers support either Z-Wave and Zigbee protocols.

The number of devices one standard openHAB hub can support is in the hundreds, so it is possible to use one hub to support a WiFi-equipped apartment building assuming that the building shares the WiFi throughout and that the system has been tested for Z-Wave range. Typically, Z-Wave gateways need to be within 100 meters of the devices they control.

4.4.2.2 Backend Server Replicability and Scalability

For the backend systems, a standard cluster of high availability virtual machines, behind a high-quality intrusion protection firewall is the most typical route we expect cities would take. A cluster could consist simply of a VM Host, two VMs running either Windows or Linux, a DNS/load balancer and a good firewall.

For a large city, the number of front-end servers and application servers could be increased, using SAN arrays between the virtual machines, and a complementary disaster recovery array to mirror the online systems. A low-cost Linux approach we researched was Antle, which supplies a single box that can run up to 100 Linux Virtual Machines, rendering the deployment of backend services a simple, easy to maintain that any city should be able to afford at under $2,000 CAD.

4.4.3 Interoperability between the technologies, other technologies, existing community systems and services, and infrastructure

Our system's purpose is all about interoperability with existing systems and community services. The JOGET workflow system will link older adult needs directly to city services, while maintaining compatibility with Open311 systems. It will offer cities the potential to trigger city services based on any identified situation where one or more sensors is used to identify a situation. It may also be

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

used in unique ways to accomplish other smart city monitoring services that go beyond the domain of older adults aging in community.

For example, a unique way to configure our system would be to link it to multiple air quality sensors and urban noise level sensors monitored by the artificial intelligence in the domain model to send out alerts to city workers and departments operating in specific sectors of the city. As our technology is based on standard protocols and configured with many options, there is no reason our system could not interoperate with any city system using standard protocols.

4.4.4 Accessibility and usability of the technologies to diverse users, residents, and other stakeholders that support their uptake and acceptance

The systems we apply to a specific older adult's home are geared for accessibility that is specific to each older adult. The majority of the system is designed from day one to be as passive as possible and not require any specific actions from a older adult, though elements such as voice-enabled assistance devices would require interaction.

Any interactive device must be chosen for its ability to match the cognitive abilities of the older adult, and over time it is possible that with cognitive decline, a device or interface used today may become unsuitable in the future. The monitoring of that older adult should help us be able to identify when gradual cognitive decline has hit a limit.

Wearable devices must be chosen for their compatibility with our criteria and standards, and at minimum, be able to send messages via MQTT or REST API via a supported communication channel, such as WiFi.

4.4.5.1 How the technologies comply with relevant legislative and regulatory requirements

The VillAGE Platform will maintain all records on the system in a HIPAA-compliant anonymized format. While the workflow system may require direct knowledge of older adult addresses and personal contact information, no other aspect of the system maintains information that would compromise older adult privacy.

The openHAB hub is an appliance that operates in their home, maintaining their sensor data in a private manner, which is connected to VillAGE servers via SSL. Operators may access an openHAB device using a secure VPN connection, but only under the direction of the occupant.

As the Workflow Engine is the main system that contains contact information, it is maintained behind a secure firewall with only the Open311 connections public-facing.

We will work with Laipac on data flow from the Look Watch to comply with our privacy practices and storage requirements.

The secure data management policies of the city and those outlined in the Preliminary Privacy Impact Assessment (PPIA) highlights the efforts taken to ensure that data is appropriately managed at all phases of collection, storage, and destruction.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4.5 ROLES AND RESPONSIBILITIES OF PARTNERS

Under the leadership of our organization's CTO for the project, the partners who will collaborate to implement the VillAGE Platform are:

Partner	Role and responsibilities
Delevante Software	Delevante Software's expertise is in developing cross-platform technology solutions for local communities based on open technologies. Delevante's role will be to lead and implement the platform development.
DOMUS	DOMUS as a research-focused organization will advise on key technology-focused portions of the development.
Concordia University	Concordia as a research-focused organization, which includes the older adult-focused ACT (Aging, Communications, and Technology) project, will advise on the development.
Laipac	Laipac will be responsible the development of the smartwatch solution for the platform.
CIUSSS West-Central	The CIUSSS W-C, as our local healthcare network and partner, will act as an advisor around privacy, technologies for digital health, and interoperability with healthcare systems.

4.6 RISKS AND MITIGATION

There are four key cybersecurity risk points in the design of our system. All best practices for disaster recovery, high availability, cybersecurity, privacy and open data will be implemented.

Risk	Mitigation
Home Hub breach	The first risk is the ability for a malicious party to take control over one or more openHAB hubs. If a party were to infiltrate the WiFi connections of a older adult they could attempt to break into the openHAB hub. To minimize this risk, the administrative accounts of the openHAB server have usernames and passwords that are administered offsite, so that the device can only be accessed by accredited VillAGE system administrators using VPN connections to the older adults WiFi. In general, throughout our system, information on the usernames, passwords, VPN connections and other security information should be stored in a secure password server such as KeePass or Linux password vault and only accessed by VillAGE system administrators and configuration teams.
Access to raw and logged data	The second risk is the security of the raw data and situational data logs. While this data is by definition anonymous, it has value to the city and information within it could be triangulated with public information to constitute a theft of personal information. For these purposes, data is kept in encrypted databases. Access credentials to the databases is kept in encrypted formats and software which connects to the data uses o-Auth or Apache Shiro. Apache Shiro is a powerful and easy-to-use Java security framework that performs authentication, authorization, cryptography, and session management. With Shiro's easy-to-understand API, you can quickly and easily secure any application—from the smallest mobile applications to the largest web and enterprise applications.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Risk	Mitigation
Server breach	The third risk is in the server system, which maintains confidential information about each older adult. This system integrates with a database that holds all survey and private information as well as location, address and contact information. This information is not available to the public. It is protected behind our firewall and uses role-based access to the system. The last cybersecurity risk is denial of service attacks, which unfortunately are becoming more prevalent. The most catastrophic would be access to confidential data on individuals in the program, which would be stored in city databases. As a primary policy, at no time will access to older adult data in the server system be accessible to non-VillAGE approved workers nor available outside our Intranet. The system prevents denial of service attacks through the use of FortiGate firewalls supporting FortiDDOS, which provides Layer 3, 4 and 5 DDOS attack prevention at high speed. CloudFlare is an alternate moderate cost solution that other cities might prefer since they require very little administration.
System downtime and lack of availability	As the number of deployments in homes increases, the overall system available will become a matter of concern. For this reason a high-availability model for the backend servers is key. Virtual machines with a shared SAN (Storage Area Network) are the preferred architecture for ease of administration. Depending on the needs of each city, they may choose from a wide array of virtual hosting and SAN hardware to achieve this. Using load-balancers between clustered machines generally keeps services running at high speed at all times while allowing for virtual machines to be shut down for maintenance without affecting the service provision. For optimal disaster recovery, a second data site that replicates the main system is preferred. On Windows servers, the use of DFS replication (distributed file system) and SQL mirroring will allow multiple virtual machines running Windows Server 2018 to run all required servers in a high availability mode with a load balancer administering the cluster. On Linux servers, following the advice on the Linux-HA project that is most appropriate to selected hardware is advised.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Chapter 5 GOVERNANCE

The VillAGE Initiative requires an extremely strong governance model for its success and sustainability, and one which puts the right players in the right places at the right time. True to its name, it will take a village of partners and stakeholders to ensure the viability of the project. The Governance Chapter is based around the Organizational Model presented in Chapter 1 (see Figure 1-1). A non-profit organization will be created, which will be governed by a Board and run by a team of senior staff.

There are two main domains around which the VillAGE Initiative runs: Technology and Social Transformation. While separate, these two domains collaborate closely. Both are fueled by ongoing community engagement with a design-thinking mindset, and service will be delivered in conjunction with a multitude of partners. The technology side is going to be run by a private partner with expertise in the domain, and the social side will be led by a person from the City of Côte Saint-Luc.

5.1 GOVERNANCE FRAMEWORK

In order to maximize sustainability and effectively deal with all the governance challenges, the City of Côte Saint-Luc proposes the establishment of a federal non-profit organization (NPO) under the *Canada Not-for-profit Corporations Act*. It would:

- Define, within its articles of Incorporation and its by-laws the various classes of 'members';
- Define the Board size and composition;
- Define members' respective roles, terms, rights, delegations, accountability, limitations and obligations;
- Create a clear and concise mission statement and strategic plan that will be its guiding force;
- Establish a policy framework and operational structure for developing, implementing, reviewing and maintaining the VillAGE policies and procedures in a form and manner that is consistent with best practice;
- Create governance and management policies;
- Stipulate other criteria that would facilitate funding, stability, growth, flexibility, research, and investment;
- Adopt a policy for data governance and information privacy protection;
- Create a risk management framework which will have a commitment to building a risk management culture in which risks and opportunities are identified and managed effectively;
- Create a legal compliance framework and an accountability framework;
- Establish the controlled entities (partnerships).

Establishing the NPO will enable the VillAGE Initiative to maximize the strengths of the government, business, and non-profit sectors, while minimizing the obstacles and drawbacks that each presents on their own. When constituting the NPO, the vision and the mission of the VillAGE Initiative will be outlined. The vision must entail a connection between government innovators and the technological and design community, and the governance must address the framework of that connection, which will be led by its Governing Board, management staff and private partners. The direct responsibility for the VillAGE Initiative needs to be shifted from the City Council to a NPO Governing Board for several reasons:

- Avoids political interference resulting from the electoral cycle;
- Allows information flow and data governance to be totally segregated from other City information systems and therefore ensures more privacy and controls;
- Allows for multidisciplinary Governing Board composed of variety of members with wide range of expertise who have wealth of knowledge and experience to guide the VillAGE Initiative;
- The VillAGE Initiative is too large to become

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

merely a city department. Its scope is to such a scale as to require full attention by a team of people dedicated to it;

- Non-profit organizations are eligible to apply for a variety of grants that municipalities are not;
- A non-profit organization has more freedom and flexibility in terms of procurement and labour relations than municipalities;
- Research and development, particularly in the domain of technology, is far from municipal expertise.

The City, however, has the benefit of public trust and proximity to the population and also has the obligation and duty to comply with all rules governing access to information and privacy protection. The City also creates by-laws, is responsible for the public domain, zoning, and infrastructure, in addition to maintaining important programs and services that are crucial to the success of the VillAGE Initiative. It is for these reasons that long-term safeguards must be put in place to ensure that the City will maintain some governing control of the NPO, and include clauses in its founding statutes that indicate the following:

- That two members of the Governing Board must be sitting members of the Côte Saint-Luc City Council, and that those seats must be preserved in perpetuity;
- That the budget must be approved by the City of Côte Saint-Luc.

As a result, the new organization will be recognized as a "public body" for the purposes of privacy protection and access to information in accordance with the *Quebec Act respecting Access to documents held by public bodies and the Protection of personal information* and among other duties it will have all the obligations and rights to protect the data, which will be generated by this Initiative.

Governing Board

The Governing Board will be made up of nine independent members with a diverse range of expertise, perspectives and knowledge who have a fiduciary obligation to oversee and ensure that they are in the role to continually assess a variety of risks regarding all elements, including but not limited to: financial reporting, ethics, privacy, technology, health and safety. The Governing Board will be accountable for the oversight of the governance process. It will include the following members:

- 2 sitting members of the Côte Saint-Luc City Council
- 1 Medical/Social
- 1 Research/Academic
- 1 Technology Entrepreneur
- 1 Venture Capitalist
- 1 Resident
- 1 Provincial Representative
- 1 Lawyer/Privacy expert

5.2 MANAGEMENT

The following positions constitute the Management Team.

The NPO will be run by a **Chief Executive Officer (CEO)** who is also responsible for the Social Transformation domain of the VillAGE Initiative. The CEO reports to the Governing Board, and is the primary link with the Technology Partner (see below), the City of Côte Saint-Luc, all other (non-tech) partners, and the Infrastructure Canada Smart Cities Challenge team. This person is responsible for the leadership and strategic direction of the NPO, its policies, development, marketing, and communications. On the Social Transformation side, this person will innovate and design municipal strategies that enable older adults to thrive, and work with the City of Côte Saint-Luc City Council and staff in order for them to incorporate these ideas and concepts.

A **Chief Financial and Operations Officer (CFO)** will run the organization, its administration, finances, legal and human resources, and fundraising, ensuring a lean management approach. This person develops procedures, implements policies, and ensures that Key Performance Indicators (KPIs) are met. The CFO reports to the CEO.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

A **Director of Community Engagement and Service Delivery** will be responsible for community engagement work and the service delivery design and team. This person will pivot between the technology and social transformation domains, ensuring that the technology is suitable and relevant to the users. The Director will also be responsible for tracking, analyzing, and reporting on outputs and outcomes, and ensuring the quality of the services provided by the VillAGE Initiative is high and that all of its users maintain their dignity, their information privacy, and are respected as the elders of our society. The Director of Community Engagement and Service Delivery reports to the CEO.

The Management Team will be collectively responsible for:

- Providing and implementing the policies and procedures through which governance occurs within the organization;
- Optimizing the efficiency and effectiveness of the organization;
- Ensuring that the VillAGE Initiative follows all relevant laws and adheres to a high ethical standard;
- Ensuring that the Technology Partner adheres to all the rules and regulations related to governance, privacy, and sustainability and that it strictly fulfills its contractual obligations;
- Continually engaging in risk assessment and mitigation;
- Working towards ensuring that the VillAGE Initiative is sustainable and ultimately, transferable;
- Ensuring that the VillAGE Initiative is a fair employer that supports its diverse staff and allows them to thrive as individuals and as part of a team in an atmosphere of respect and professionalism;
- Ensuring that all staff, partners, and anyone else connected to the VillAGE Initiative hold true to its mission;
- Gathering data and reporting on all activities on a regular basis to the Governing Board, Infrastructure Canada, and all other parties outlined in the founding charter;
- Data Governance and Information Privacy Protection.

5.3 PARTNERS

The ultimate success of the VillAGE Initiative extends far beyond the NPO. An entire ecosystem of partners, including all levels of government, the research, health and private sectors, community groups, and citizens will collaborate to address the complex and widespread challenges our society faces related to aging.

5.3.1 The Technology Partner

The Technology Partner is the primary partner for the VillAGE Initiative, one essential to its existence. In the Organization Model (see Figure 1-1), the entire technology domain will be provided by a private company, consisting of a consultant who will serve as the Chief Technology Officer (CTO) and his full tech team, in order to develop the platform and do all the research and development, working with partners on the technology side. This company will be the same one with whom the City of Côte Saint-Luc contracted to help create and manage the Final Proposal project, and who was instrumental in developing the VillAGE Initiative.

The decision to contract out the technology portion of the VillAGE Initiative was based on the following:

- For-profit companies are run in an agile way, and are able to be extremely flexible.
- Private companies are eligible to receive R&D tax credits from other levels of government.
- The size of the technology team required to create the VillAGE platform is larger than what the budget allows and the size of the team required will fluctuate. The NPO will not have to allocate resources to manage them.

Delevante has more than 15 years of experience and expertise building large-scale technology solutions across a wide range of sectors including: aerospace, investment finance, pharma, healthcare, energy, entertainment, social media, and retail. Today, Delevante's focus, expertise, and pas-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

sion are in building modern technology platforms, based on open technologies, that drive engagement and commerce for local communities, which is philosophically aligned with Côte Saint-Luc's and the VillAGE Initiative's objectives. Delevante is the creator of the leading-edge mobile-first platform Numnu, a smart connected platform that allows consumers to discover events (festivals, fairs, and more) in their area, engage on-site, place mobile orders, and promote local vendors and products to their networks. Founder and CEO of Delevante is Marc Chriqui, former president of Raymark, a leading global enterprise retail software vendor strategically acquired by US-based Mi9 Retail in 2015. Marc personally and very closely collaborated with Côte Saint-Luc during the Smart Cities Challenge finalist phase as Project Director. Concepts from Marc's expertise around smart and connected retail stores translated well and informed our designs for smart connected solutions for residents' homes and mobile devices.

5.3.2 City Partner

We outlined the special relationship that the VillAGE Initiative has with the City in the Governance Framework section of this chapter. Further information needs to be added, however, as the Initiative has a special and symbiotic relationship with the City. So important is this initiative to the residents of Côte Saint-Luc that the City is providing many in-kind donations, of space, resources, and services, especially in the first few years. The residents will need to have the comfort that the City is still behind the Initiative, even if it is not directly running it. This will be achieved through several means:

- City staff familiar to residents will have key and public roles in this Initiative;
- Community engagement will be done in conjunction with the City, in city spaces;
- Many services offered by the VillAGE Initiative, such as technology education and training for older adults, will be given by the City;
- Important activities, such as making Côte Saint-Luc an officially Age-Friendly Community will be done collaboratively;
- City departments such as the Library, Parks and Recreation, and Public Safety will co-develop programs and service with the Initiative;
- The *Programme d'adaptation de domicile* (PAD) program will continue to be administered through the City, and lobbying to modify it to include technology will be done by the municipality as well;
- Cross-promotion will occur continuously;
- The City will collaborate with all VillAGE research partners as a 'Living Lab'.

5.3.3 Other Partners

The VillAGE Initiative has, as part of its organizational model, relationships with research partners in both the technology and social domains. The goal is to continue working with valued partners to fulfill the vision set out in this proposal, and also to co-create with them and expand knowledge that will benefit society. See Appendix for the letters of support from our partners, which outline the nature of future collaboration. Our partners include the following:

RESEARCH PARTNERS

The VillAGE Initiative has, as part of its organizational model, relationships with research partners in both the technology and social domains. The goal is to continue working with valued partners to fulfill the vision set out in this proposal, and also to co-create with them and expand knowledge that will benefit society. Our partners have provided letters of support, which outline the nature of future collaboration.

Université de Montréal/Institut Universitaire de Gériatrie de Montréal: Our existing collaborators who have accompanied us so far in the community engagement and pilot projects, are committed to work with us to co-develop solutions and measure their social, human, and economic impacts. They will continue to provide the VillAGE Initiative with their expertise, time and resources in order to implement and measure performance outcomes for research and future development of smart solutions for older adults. They will also help secure funding and help develop an implementa-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

tion guide so that other cities may benefit from the VillAGE Initiative.

« Cette co-construction ardemment souhaitée par la Ville, et l'écosystème créé autour du projet, m'amènent à considérer la Ville comme un véritable laboratoire vivant; une infrastructure sociale et communautaire qui permettra l'émergence d'innovations par et pour les residents. »

—**Nathalie Bier**, erg., PhD. Professeure agrégée, École de réadaptation, Faculté de médecine, Université de Montréal

Université de Sherbrooke/Laboratoire DOMUS: This is a university research lab, which has developed smart-home-for-seniors technology platform using open technologies. They were our primary partner in the pilot project. They will continue to develop interdisciplinary solutions and lend their expertise to the VillAGE Initiative, helping to introduce new technologies to older adults in an effort to reduce social isolation.

« Le laboratoire DOMUS est donc prêt à soutenir ce projet en engageant son expertise dans une démarche interdisciplinaire pour cerner les enjeux, élaborer des solutions appropriées et respectueuses et tester ces innovations sociales auprès des aînés. »

—**Hélène Pigot**, Professeure titulaire en informatique, Chercheuse au Laboratoire DOMUS et **Sylvain Giroux**, Professeur titulaire en informatique, Directeur du Laboratoire DOMUS

Concordia University: With their EngAGE and PERFORM centres, Concordia has undertaken to provide expertise in the development of programs, services and policy-development related to older adults.

“From prevention to big data insights to arts-based therapies, our researchers are harnessing the potential of treatments and technologies for better health for older adults and facilitating next-generation solutions to pressing issues facing cities around health and well-being.”

—**Christophe Guy**, VP, Research & Graduate Studies, Concordia University

Age-WELL is Canada's technology and aging network dedicated to the creation of technologies and services that benefit older adults and caregivers. They see the VillAGE Initiative as advancing their mission to develop a community of researchers, older adults, caregivers, partners and future leaders that accelerates the delivery of technology-based solutions that make a meaningful difference in the lives of Canadians.

“Our commitment to your proposal will be through providing access to our members, researchers, and stakeholders, and by providing your group with consultation on the various issues related to emerging technologies and smart cities.”

—**Alex Mihailidis**, PhD PEng, Scientific Director & CEO, AGE-WELL NCE Inc.

HEALTH PARTNERS

Working closely with the CIUSSS West Central, the Ministère de la Santé et des Services sociaux du Québec (MSSS), and other leading experts during the finalist phase, we learned that healthcare will increasingly become decentralized. Dependencies on hospitals will be reduced. The point of care will be wherever the patient is—whether at home, in community, or elsewhere. Digital health will continue to drive the way care is delivered and we will continue to see an increasing focus on prevention and prediction with the help of new and advanced technologies.

We will work with our healthcare partners through the VillAGE Initiative to lay the digital foundation in which smart cities and healthcare providers could deliver better care to the home and improve outcomes along the continuum of care. This would not only improve care in the future, but could for the first time actually begin to identify and pre-empt clinical problems before people require treatment.

Ministère de la Santé et des Services sociaux (MSSS), Gouvernement du Québec: The VillAGE Initiative is very much aligned with the orientations of the provincial health ministry, especially as relates to aging in place, and they fully support the project and will have a seat on the Governing Board. As they believe that this initiative will have

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

concrete and positive effects on the well-being of older adults, they have expressed, in their letter of support, a desire to discuss a framework for sustainability.

> « Votre projet s'inscrit en cohérence avec les orientations ministérielles du réseau de services intégrés pour les personnes âgées et est intégrateur des divers services qui sont offerts dans une communauté impliquée activement auprès de ses aînés. »
>
> —**Natalie Rosebush**, Directrice générale adjointe des services sociaux et des services aux aînés, Ministère de la Santé et des Services sociaux du Québec

Integrated Health and Social Services University Network for West-Central (CIUSS West-Central Montreal): Our primary health and social services partner would act in an advisory role for our program governance, as well as information privacy protection and measuring outcomes. The alignment of our respective technological roadmaps and data integration would enable us to co-develop better patient care. They are most interested in partnering for the delivery of digital health on the VillAGE platform. If the future of care is where the patient is, then the first ones to get it will be the VillAGE participants on the platform.

> “Côte Saint-Luc's VillAGE Initiative would lay the digital foundation in which smart cities and healthcare providers could partner to deliver better patient care to the home and improve outcomes along the continuum of care.”
>
> —**Dr. Lawrence Rosenberg**, President and CEO,CIUSSS du Centre-Ouest-de-l'Île-de-Montréal | Integrated Health and Social Services University Network for West-Central Montreal

INDUSTRY PARTNERS

MEDTEQ: This industrial Consortium for Research and Innovation in Medical Technologies has committed to support the VillAGE Initiative through several forms of contribution: in-kind expertise via MEDTEQ staff and resources for the structuring of eligible collaborative projects as well as project management support; financial support from MEDTEQ for collaborative projects with industry which can represent a direct contribution of up to $500,000 per project year over three years (maximum $1.5M per approved project) and direct financing in accordance with the consortium's current program rules (maximum of $1M for the MEDTEQ tranche in a syndicated round of financing).

> “Our belief is that Canadian talents and entrepreneurs in partnership with our public health care system and communities, can develop and implement substantial cost savings solutions for the well-being and health of seniors and their families.”
>
> —**Diane Côté**, CEO MEDTEQ Consortium

Laipac Technology Inc.: Based in Richmond, Ontario, Laipac is an industry leader in mobile healthcare solutions, developing Internet of Things (IoT) products since 1999 that have been exported to more than 100 countries. We worked with Laipac during our pilot project around their feature-rich Look Watch product. In a complete implementation and rollout of the VillAGE Initiative, we would continue our collaboration towards creating a seamlessly integrated smartwatch for older adults offering more convenience, safety, and social connectedness.

> “Should the city be a winner in the Smart Cities Challenge, we would welcome the opportunity to collaborate further on a broader rollout that would meet your program vision and resident needs.”
>
> —**Diego Lai**, CEO, Laipac Technology Inc.

ECONOMIC DEVELOPMENT PARTNERS

Agence Ometz and **PME Centre West Montreal** are two organizations which promote employment and entrepreneurship and which have committed to work in close collaboration with the VillAGE Initiative. As more fully described in Chapter 9, these agencies provide advice and guidance for business start-ups and offer services to entrepreneurs and job seekers.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

COMMUNITY PARTNERS

Cummings Centre, St. Patrick's Square, and B'Nai Brith Canada: There are at least three subsidized residences for independent older adults who have indicated serious interest in collaborating with this Initiative: Caldwell Residences, B'nai Brith and St. Patrick Square. St. Patrick's has already proven to be an invaluable partner in the pilot project and will be again during implementation. They are investing in smart building technology in partnership with the City and its residents. By deploying the VillAGE devices into a few of the older adults' apartments in each building in collaboration with the building's administration, we will be able to measure performance and success in a controlled trusted environment, which will allow residents to remain in their homes longer without having to go to assisted care.

5.4 RISKS AND MITIGATION

The risks related to governance are outlined in the table below.

Risks	Mitigation Plan
Potential for ambiguity of roles and responsibilities	Sign written agreement outlining the relationship between the NPO and the City, including financial arrangements, in-kind donations, human resource allocation, service harmonization and any other shared issues. Develop comprehensive guidelines on roles and responsibilities within the NPO for each level including: • Level and form of engagement of different actors. • Delegation of authority. • Scope of operation and the origin of funding. • Relationship with each other and other partners or stakeholders. • Level of assistance and support with each other. • Explicit mandates of each. • Partnership agreements and scope. • RACI Chart. Create codes of conduct and ethics for the Governing Board and employees.
Outsourcing technology development	Clearly define in a contract agreement the scope, deliverables and timeline for the development of the technology platform, including adherence to privacy policies and procedures, and relationships with other partners.
Human Resources—Finding suitable candidates, start-up very tied to specific people, creating organizational culture	• Build a Human Resource Management Plan that is integrated with decision-making throughout the organization and which has built-in succession-planning. • Develop clear job descriptions with performance outcomes that are aligned to the values and mission of the organization and which incorporate diversity and inclusion. • Create a recruitment strategy to find the best candidates for each position. • Create an organizational chart. • Develop an onboarding program. • Develop a training program to fill skill gaps for both management and employees. • Develop a performance appraisal and recognition program. • Include a liability insurance plan to cover for long-term management absences.
Cash Flow and Collection cycles based on Milestones—continuity breakdown	Clearly define outcome performance agreement per project with the Government of Canada to ensure continuity of projects and outcomes.
Time Escalation on Deliverables	Chart starting and projected delivery date for each activity output on a development chart to measure, control and manage possible slips and adjust when needed.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 6 ENGAGEMENT

This chapter is a summary of what we have learned through community engagement activities to date and our Community Engagement Plan for the next phase of this project. We will also highlight the opportunities for ongoing conversation with our residents and other important stakeholders, which will help define and shape the VillAGE Initiative.

During our community engagement phase, we sought feedback from seniors, caregivers, and other stakeholders in the community in three main areas:

- The needs, worries and challenges they experience as they or their loved one age in community.
- How they view the role of smart technologies to help them age in community.
- How they view the role of the City in supporting aging in community.

Focus groups, public consultations, advisory committee meetings, and a pilot project have been vital. They have created a common understanding and a space for ongoing dialogue with residents. We gathered insights on current issues that are important to them and their families related to aging in community. Residents liked the open, two-way dialogue. They proposed ideas and came up with collective solutions. The meetings also confirmed for us the real needs and desired outcomes of our residents.

During the next phase of the VillAGE Initiative, we will make efforts to expand the number and diversity of the voices providing guidance in the development of the VillAGE Initiative.

6.1 SUMMARY OF RESULTS OF COMMUNITY ENGAGEMENT ACTIVITIES TO DATE

We worked with the following groups and organizations:

- Côte Saint-Luc programs and services including the public library, Aquatic and Community Centre (ACC), Emergency Medical Services EMS), volunteer Citizens on Patrol (vCOP), volunteers
- Research partners from the Montreal Geriatric Institute
- St. Patrick Square pre-retirement community
- Cummings Centre

We conducted the following community engagement activities, which have driven the direction of this proposal:

- Community engagement planning and visioning
- Information sessions
- Focus groups/action research
- In-person public consultation
- Online public consultation
- Senior advisory group meetings
- Project website
- Pilot project

Several key themes emerged through this engagement effort. They are summarized here with explanations in the next sections:

- Older adults would prefer to age in place, yet face a variety of challenges to doing so.
- Smart technology designed for convenience, safety and social engagement can be used to help give older adults and their caregivers peace of mind when aging in place.
- Technology needs to be simple to use, affordable, older-adult-friendly, and customizable.
- While privacy concerns did emerge, most people expressed that they would let go of some privacy in order to have more security as long as privacy was protected.
- Residents expressed a strong level of confidence and trust in the City of Côte Saint-Luc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

GAGEMENT

n infrastructure already in place in Côte Saint-Luc for this initiative to

t the human element—it's not about people to technology but about people to people using technology.

6.2 COMMUNITY ENGAGEMENT VISIONING

Between June 2018 and September 2018, the VILLAGE Initiative team clarified the community engagement issue, developed principles for community engagement and defined the community to be engaged.

6.2.1 Community Engagement Principles

Inclusivity: The City encourages participation by those who will be affected by a decision. We want people to feel agency, to enable them to make a meaningful contribution to their community to matter what their age or background.

- **Connectivity:** The City aims to create networks of community members, linking people from different backgrounds to the City and to each other.
- **Coordinated approach:** The City coordinates community engagement activities to use resources effectively. Residents and community groups are our partners.
- **Open and timely communication:** The City provides information that is timely, accurate, accessible, easily understood and balanced. Public engagement processes will be designed to involve the appropriate people at the appropriate time in the appropriate way.
- **Transparency and accountability:** The City explains its governance processes to residents and ensures that information is readily available to the public.
- **Change and continual improvement:** As technology and circumstances changes, so too will the City. Continual feedback from residents will ensure that the City evolves with them and their needs.

6.2.2 Understanding the Community

While older adults are the target population for this Smart Cities Challenge initiative, many other groups of people will be affected by it as well including families, caregivers, neighbours, future older adults, residences, partners, health care professionals, city staff, and city councillors. Each of these groups have their own needs and concerns and we wanted to ensure they each had the opportunity to participate in community engagement activities. Engagement efforts were conducted with a focus on equity to connect with the broadest cross-section of the City of Côte Saint-Luc population, including focusing on reaching under-represented people.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 6 ENGAGEMENT

6.3 COMMUNITY ENGAGEMENT PLAN

In September and October 2018, we developed a Community Engagement Plan with scope, timelines, locations, costs, and responsibilities to ensure that residents were given opportunities for various levels of participation, from receiving information, to being consulted, to collaborating and active participation. Below is a summary.

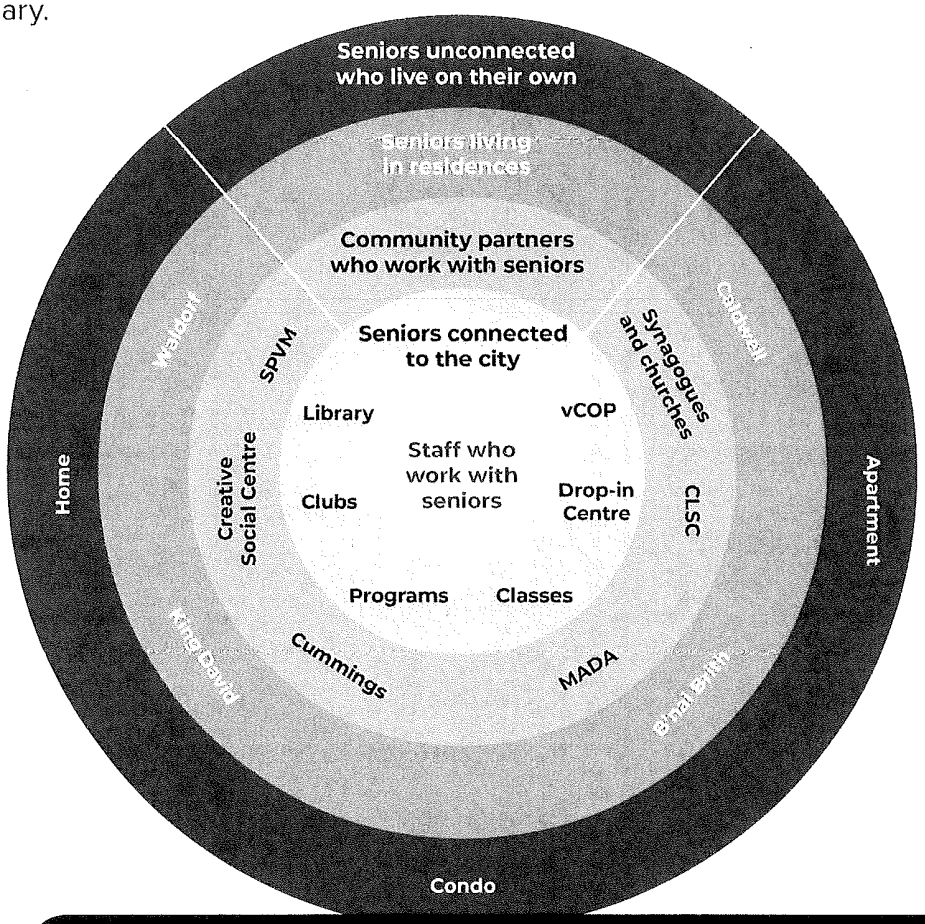

Figure 6-1: Illustration showing the concentric circles of connectedness to the City, from most connected in the inner circles, to least connected in the outer circles.

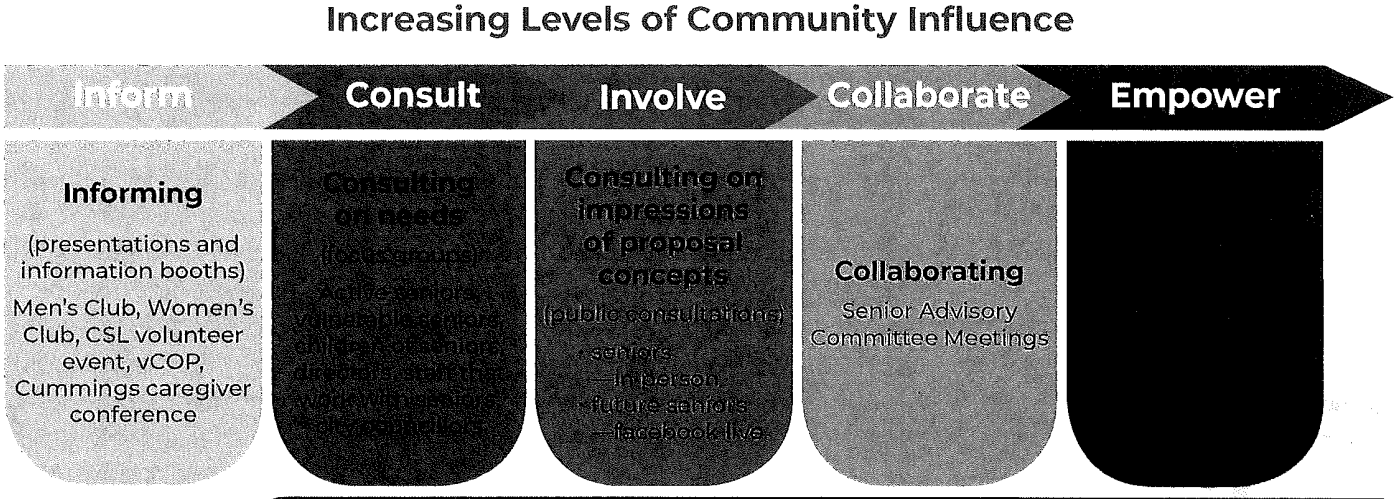

Figure 6-2: Chart illustrates five increasing levels of community influence including inform, consult, involve, collaborate, and empower.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

6.3.1 Summaries from Engagement Activities

We conducted more than 15 community engagement events with more than 1,000 residents from November 2018 to January 2019. We also sent letters to 14,000 households with information about the project and an invitation to participate in the public consultations.

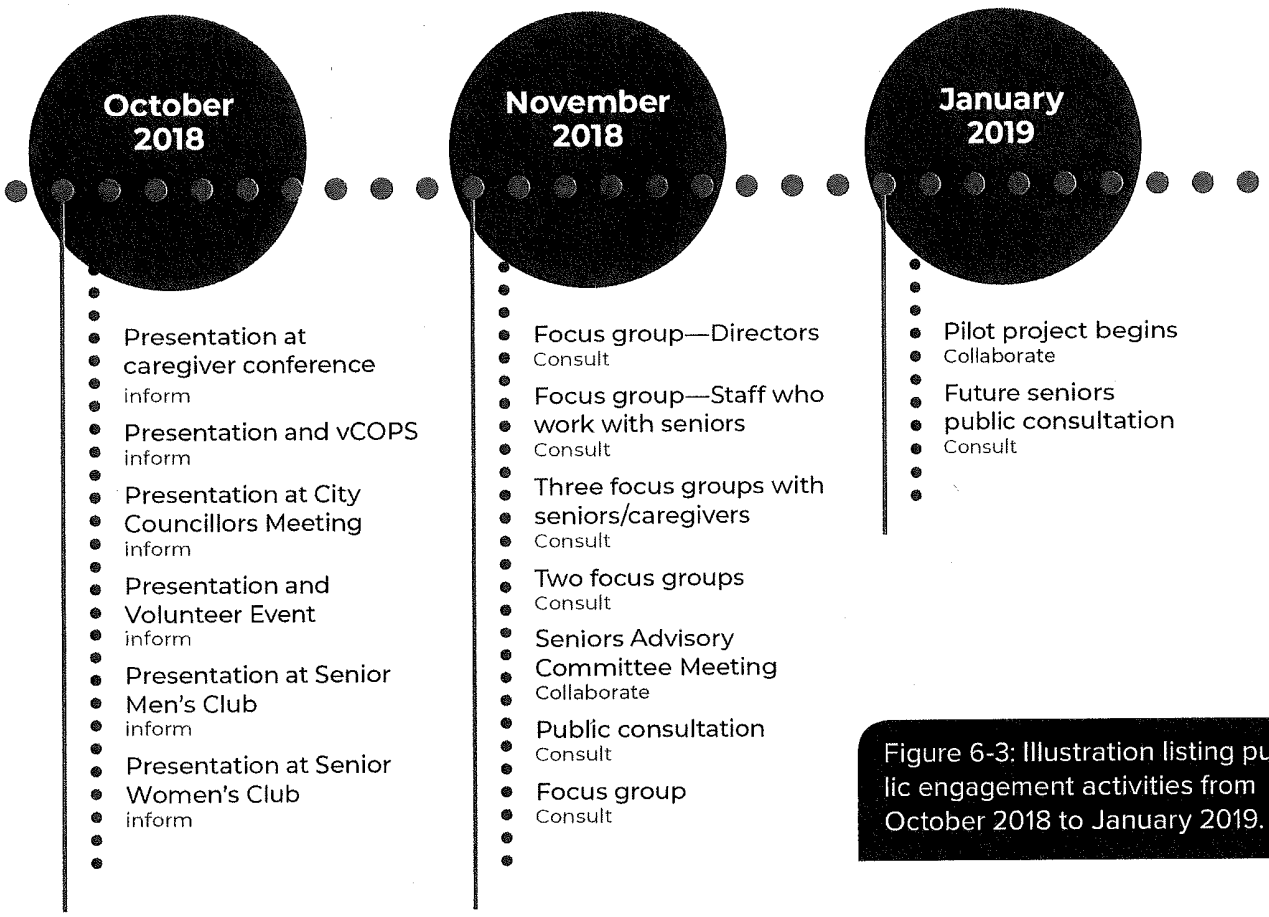

Figure 6-3: Illustration listing public engagement activities from October 2018 to January 2019.

6.3.1.1 Inform: Going Out Into the Community

The first phase of community engagement was informing stakeholders and residents about the Smart Cities Challenge and inviting them to participate in various activities. Information presentations and booths with invitations to sign up to participate in engagement sessions were given to the Côte Saint-Luc Men's Club, the Côte Saint-Luc Women's Club, a Côte Saint-Luc volunteer appreciation event, vCOPs, and a Cummings Caregiver conference. We connected with, informed and invited more than 1,000 people as a result of these informational sessions. We also spoke on local television, used Facebook and Twitter to share our progress, and produced videos to update residents.

6.3.1.2 Consult: Focus Groups

We conducted focus groups with our research partners to determine the most pressing needs of older adults when it comes to aging in place. The focus groups helped to ensure that everyone had the same understanding of the project and to prioritize needs for the proposal. We met with six groups of people (ranging from 4 to 12 people per group) including active older adults, vulnerable older adults, children of older adults, senior City staff, staff that work with older adults, and City Councillors. All groups were asked the same questions following a structured interview guide. During these focus groups—despite some differences between them—we were able to see trends emerge in terms of challenges to aging in place,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

perceptions of technology, how Côte Saint-Luc has a lot of resources that it can leverage, and privacy concerns. The results of the focus groups helped the team come up with the concepts of the VillAGE Initiative Proposal: smart technology for convenience, safety and social engagement through a connected community of people helping people.

What we heard

We heard four broad themes from the focus groups, which can be summarized as follows:

1. **Challenges to aging in place:** social isolation, safety and insecurity, health care system, desire to remain autonomous, mobility, accessibility, daily tasks caregiver burden
2. **Perceptions of technology:** older adults learning curve, socio-economic gap, human connection, purposeful, simple, passive, reliable, caregivers (collect objective data for decision making), connect with others in city for help with daily tasks
3. **What the City can leverage:** confidence/trust in the city, public library and Aquatic and Community Centre are main hubs, partners with community organizations, "connector" role, advocacy and informational support, infrastructure already in place
4. **Privacy concerns:** hackability, theft, what will happen with the data, must be individualized, trustworthy technical support (choosing, installing, ongoing help), manage the privacy risks not avoid them (safety number 1 priority)

6.3.1.3 Involve: Public Consultations

We organized two public consultations to understand the impressions of Côte Saint-Luc residents regarding the concepts being submitted in the proposal, that is, the VillAGE Initiative and smart technology for convenience, safety, and social engagement.

CONSULTATION NO. 1: The first consultation attracted 81 participants. It was conceived for older adults and to be participative in order to share concepts from the Smart Cities Challenge and gain impressions of older adults.

What we heard

We asked participants to draw a **care map** indicating who they would call during an emergency or if they need help with something. The results were surprising. Some people indicated family or friends close by, or a neigh er, health care professional or comm that they rely on for support. Howe ple expressed that they were alone relied on emergency services for e ations. Nobody listed the City as a care map.

meaningful engagement

After the VillAGE Initiative concepts ed, the participants asked what, if anything gave them **peace of mind** about the project. They indicated that they like the VillAGE initiative for both social engagement and security. The people-helping-people approach resonated with participants, as did the concept of village as a way to build community and feel connected and less isolated. They liked the idea of healthy older adults helping isolated older adults and having someone "be there without being there." Others appreciated the safety and security that it could bring to people who live alone.

We asked about **concerns** related to the project. Participants raised several issues related to privacy, accessibility, and the human element. For privacy, participants expressed concerns around invasiveness, hackability, and what would happen in the event of power failures or malfunctions. For accessibility, they had concerns about affordability, language, simplicity of technology and adaptations for people with hearing, vision, speech and mobility impairments. For the human element, they said that technology without people will not be accepted, and that we can't forget about the human element.

CONSULTATION NO. 2: The second consultation was for future older adults (ages 40 to 64) and was facilitated by the City Manager, the Mayor and two municipal councillors. It was streamed on Facebook Live. Participants were asked for feedback on the proposal and its impact on them as they age. Twenty-two participants attended this event.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

We asked participants how they would define **Thriving** as it relates to aging. Their answers focused on feeling connected and contributing to society, remaining active and engaged and having a sense of meaning and purpose. The perceptions of and interest in the **VillAGE Initiative** were very positive with participants reflecting on that fact that this would have an "amazing positive impact in the event of a major event like last years heat wave" and that this would be "one less barrier for older adults." They suggested that municipalities be at the frontlines for preventions and work closely with public health agencies. This age group is prepared to give of their time to help support the initiative.

6.3.2 Collaborate: Senior Advisory Council

A permanent Côte Saint-Luc Senior Advisory Council was established and its first meeting was held in November 2018. Chaired by the City Manager, the members of the Senior Advisory Council included several senior members of the community, volunteers, community partners, elected officials, and city staff who work with older adults. The first meeting focused on the Smart Cities Challenge, and feedback about what was proposed. Thoughts and concerns included:

- Ease of use related to technology
- Lack of WiFi
- Potential costs and accessibility
- Transportation
- vCOP able to make a positive contribution
- Volunteerism deemed to be an important part of the project

6.3.3 Empower: Pilot Project

We launched a pilot project in January 2019 with research partners from the Montreal Geriatric Institute. We implemented smart technologies and monitoring devices into the homes of five older adult participants. The purpose was to get preliminary information on the level of usability and acceptability of the technologies. The five were selected from a pool of more than 15 older adults who showed interest in participating in the pilot project. The five were selected based on predetermined criteria (e.g., living alone, WiFi at home, no big pets, etc.). While we used a convenience sample, every effort was made to ensure a diverse group in terms of gender, language and socio-economic status.

Demographics of pilot participants:

- 3 men, 2 women
- 3 apartments (1 specifically for autonomous older adults), 2 single-dwelling homes
- 3 have involved family living in Montreal, 2 do not
- Age range: 65 to 93

All participants expressed challenges related to safety in the home, performance of instrumental activities of daily living, and fear of falling. None of them had any cognitive impairments, and two shared that they were experiencing some symptom of depression.

During the first meeting, participants signed consent forms and sat for a short interview and completed standardized questionnaires. During the second meeting, we implemented the technology and offered education in learning how to use it. Ongoing support was provided. Only one participant has been involved long enough to have participated in a follow-up interview to discuss perceptions on usability and acceptability

What we learned

A few weeks after installation, participants were asked questions about the usability and acceptability of the technologies. In general, participants expressed:

- The sensors did not feel invasive
- The level of support provided during installation was excellent in terms of explanations received. The letter that was created to describe the process which was given to each participant is attached.
- Alexa was especially appreciated, however participants wished it was programmed to do more things—such as making calls to family and friends

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)

- Aside from the Alexa, the rest of the technology had no impact on improving or hindering daily activities
- The installation of the sensors and lights was not always done satisfactorily and they fell off—several visits were often needed to ensure that sensors were installed properly
- Participants need access to training and support to ensure the proper use of smart home technologies
- One participant was given a Laipac watch that had fall detection and SOS button functions—however, it kept giving false alerts and therefore was not satisfactory and [redacted] disabled during the pilot. Furthe[redacted] device is warranted.
- Participants would be willing to [redacted] ware and some monitoring sub[redacted] however reported that subsidie[redacted] be available for people who ca[redacted] this point they were not comfo[redacted] ting to a price they would be willi[redacted] they do not know exactly what they would be receiving or how it would help.

See Appendix for consent forms, letter given to participants, and preliminary report.

6.4 COMMUNITY ENGAGEMENT STRATEGY FOR THE NEXT PHASE

During the next phase of the Community Engagement strategy, we will focus on equit[redacted] connected with an even broader cross-section of Côte Saint-Luc population. We want to r[redacted] resented and health-disparity populations, increase stakeholder involvement, and distr[redacted] materials in a more targeted and strategic manner. We will continue to work closely witl[redacted] and other partners working with specific populations and communities to provide ongoin[redacted] in a variety of formats for residents and stakeholders to share experiences and ideas [redacted] Initiative. Given the opportunity, we will focus on adding the following principles to our [redacted] gagement Strategy.

6.4.1 Outreach

We will take engagement to places where people are already congregating, setting up pop-up workshops at community events and popular destinations to make it easier for community members to provide their comments without having to attend a separate meeting. This will help us to ensure that the right community members are at the table.

6.4.2 Participative Approach

The process and structure of community engagement activities will allow for all voices to be heard and equally valued. Community members will be involved in developing the VillAGE Initiative from conceptualization, to implementation, to evaluation, to ensuring it is culturally sensitive.

6.4.3 User-friendly Material

To effectively communicate with m[redacted] public, we will develop welcoming jargon-free community engagement[redacted] are visually attractive and written w[redacted] derstand language. Bright stickers, pens and markers will be provided share comments.

6.4.4 Design-Thinking Approach

In order to ensure that the best, most impactful services will be delivered, we will apply IDEO's Design-Thinking process (described below):

- **Empathize:** Learn about the audience through observation, seeking to understand users' perspective

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **Define:** Construct a point of view based on user needs
- **Ideate:** Brainstorm and come up with creative solution
- **Prototype:** Build representations of ideas
- **Test:** Test ideas through prototyping, pilot projects

Once tested, the developers of both technology and social transformation will loop back into the relevant phase to re-define, re-ideate, re-create a prototype, and re-test until the service works and satisfies user needs and expectations. This process puts community engagement at the heart of design and innovation and allows the actual users to share their experience of a service with those who will be delivering it.

In addition to traditional community engagement activities including presenting at conferences and events, focus groups, and mailings, additional efforts to engage residents will be made in person and online.

6.4.5 In-person Activities

Activity	Description
Senior Advisory Committee meetings (4 meetings per year)	Composed of health care professionals, older adults, caregivers, and city staff. The primary role is to: • provide multidisciplinary, well-rounded perspective on needs of older adults and caregivers and solutions • provide guidance on VillAGE initiative planning and implementation process • assist in disseminating information and serving as a liaison to community members
Pop-up workshops (2 to 4 per year)	Informal engagement opportunities strategically located in places where people are already congregating including the library, the Aquatic and Community Centre, the malls, community events, parks and other popular designations. These workshops will include opportunities to interact with the smart technologies that making learning about the project and sharing ideas easy and inviting. Pop-up workshops enable people to share comments quickly, provide materials for participants to engage with online materials on their own time, and capture the perspectives of people who may not ordinarily attend more traditional workshops.
Listening sessions (4 per year)	Listening sessions, like pop-up workshops, take the meeting to the people. However listening sessions typically take place at a regular meeting of a pre-existing group. For example, a listening session may take place at a Senior Men or Women's Club meeting, or at an activity taking place at a local residence or community centre. Listening sessions enable people to participate in the planning process at meetings they already attend regularly, and provide an opportunity for in-depth discussion with specific demographic or special interest groups within the community.
Showcase with user experience sessions (2 per year)	Innovation-through-design thinking is a structured, human-centered method for creatively solving complex problems that inspire and delight users. Using iterations to: • test and stage • refine prototypes and solutions • learn more about user • refine solutions
Individual interviews (at least 10 individuals)	Individual interviews with residents who are homebound and cannot participate in the focus groups or other community engagement activities

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Activity	Description
Thrivability sessions for the VillAGE Community App (monthly)	Working with an experienced facilitator, we will work with residents to cultivate the fertile conditions for the VillAGE Initiative to be successful and for older adults to age in a place of their choosing, closely connected to their communities with the supports and tools they need. We will explore aging of their own design, opportunities for residents to use their talents to improve the VillAGE and plan social activities that minimize isolation and promote interaction and trust within the village community, between individuals who ask for help when needed and individuals who offer help. These sessions will help to fill the gap and allow meaningful engagement and initiative of the VillAGE before service delivery can begin.

6.4.6 Online Activities

Activity	Description
Website	VillAGE Initiative website will be maintained and expanded to communicate general project information, announce events and engagement opportunities, and house online engagement tools like the survey. The project website will also provide an area for people to share open-ended comments related to the project and to opt into the mailing list and receive e-mail updates.
Survey	An online survey will be developed and accessible directly through the website. Hard copy forms will be available as well. The survey will be developed with our research partners to ensure reliability and validity.

6.5 RISKS AND MITIGATION MEASURES

Risks	Risk Mitigation Plan
Low engagement levels of identified target groups, which can jeopardize the success of the onboarding stage of the platform and service delivery buy-in	• Ensure tools and locations of community engagement are accessible and spread out across the City of Côte Saint-Luc • Focus on outreach and bringing engagement opportunities to where people congregate using pop up workshops and listening sessions
Community concerns, needs and questions not sufficiently addressed, jeopardizing success and sustainability of platform and service delivery	• Design community engagement sessions to ask the right questions • Give residents many opportunities to express their needs, concerns and questions
Lack of information or misconceptions about the project and its outcomes leading to disillusionment of participants	• Ensure transparency in community engagement sessions in terms of where we are, where we are going, and how information gathered from residents will be used in developing the VillAGE Initiative • Communicate updates and how they like to findings from community engagement
Interactions & discussions during engagement activities going off tangent or being monopolized by a few participants	• Use facilitators with extensive experience in dealing with difficult group dynamics and keeping discussions on track
Long lag time between community engagement and onboarding of platform and service delivery phases of the project	• Plan on-going engagement activities including regular brainstorming and working session where residents can play a large role in the development of the ViLLAGE Community App (people helping people)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Chapter 7 DATA AND PRIVACY

This chapter is to be read in close conjunction with the Preliminary Privacy Impact Assessment (PPIA) and documents which have been placed in the Confidential Annex on Privacy.

7.1 CONTEXT

Many private companies in the world market are promoting the use of smart home solutions for older adults, but without the rigorous data governance rules and oversight that are necessary to protect users' sensitive personal and health information. Who owns the sensors, who has access to the data they collect, and what the data can be used for are all issues arising from the proliferation of tracking and monitoring devices and systems. In the hands of private companies, individuals' personal information is often leveraged and commercialized for targeted marketing and other purposes, as has been recently revealed in other smart city projects. [5]

The VillAGE Initiative is committed to the highest standard of privacy and data protection. Privacy-By-Design is built into the VillAGE Initiative and will become the standard for other Canadian cities that adopt this program. This will put Canadian cities on the map for the Cities Coalition for Digital Rights, a world initiative to promote and track progress in protecting residents' digital rights in cities. [6]

7.1.1 The New Organization

The VillAGE Initiative will reside within a third-party non-profit entity created to manage the VillAGE Initiative. The structure and governance of the new organization would ensure that data collected, created, and generated by the VillAGE Initiative would continue, in perpetuity, to be subject to data protection and access rights and responsibilities applicable to the City and all provincial "public bodies." Since the new organization will be constituted in compliance with the *Quebec Act respecting Access to documents held by public bodies and the Protection of personal information* it will have all the duties, obligations, and rights to protect the data which will be generated by this Initiative.

According to the VillAGE Initiative Governance Model, one member of the Governing Board will be a privacy expert so that we maintain data governance and privacy protection as a constant consideration throughout the execution, implementation and entire lifecycle of the project.

7.2 THE PRELIMINARY PRIVACY IMPACT ASSESSMENT

At the very early stages of the finalist phase, the City of Côte Saint-Luc engaged Sharon Polsky, President of AMINAcorp.ca, President of the Privacy and Access Council of Canada, and a Privacy by Design Ambassador with more than 30 years experience, to consult and advise the Côte Saint-Luc Smart Cities Team in the preparation of this VillAGE Initiative proposal.

As is more fully elaborated in the Preliminary Privacy Impact Assessment (PPIA), which is included in the Confidential Annex of this proposal, the privacy consultant conducted a thorough assessment of the City's information protection and privacy compliance policies. As a result, she prepared a very exhaustive PPIA with 91 recommendations. Furthermore, she proposed that the City adopt an Information Privacy Protection and Governance Policy Framework, and the City is prepared to adopt that Policy Framework in a timely fashion. In addition, the City envisions incorporating the suggested Policy Framework and the recommendations into the articles of incorporation of the new

[5] "Smart Cities May be too Smart for their Own Good" National Post Feb 2 2019 in the Appendix https://business.financialpost.com/technology/smart-cities-may-be-too-smart-for-their-own-good

[6] See Bianca Wiley (@ biancawylie) Senior Fellow at the Centre for International Governance Innovation and co-founder of Tech Reset Canada "Why we need to push for data rights in Canada. "in the Appendix https://business.financialpost.com/technology/why-we-need-data-rights-not-everything-about-us-should-be-for-sale

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

VillAGE Initiative non-profit organization as part of its creation.

The Policy Framework is intended to provide the foundation of the City of Côte Saint-Luc's Information Security and Privacy Protection program, and enable the City and the new VillAGE Initiative organization to effectively identify, manage, and mitigate the risk of data exposure or compromise within the organizations' computer and information-handling systems and the technology and communications devices under their control.

All the essential elements related to privacy in support of this project are addressed in the PPIA, including compliance with all relevant privacy regimes, types and methods of data collection, and efforts and recommendations to adhere to the ten universal privacy principles which are the foundation of the Fair Information Principles that form the basis of Canada's Personal Information Protection and Electronic Documents Act (PIPEDA). Certain additional elements relating to privacy merit to be highlighted in this section which is not covered by confidentiality.

7.3 PRIVACY BY DESIGN AND HOW PUBLIC CONSULTATIONS INFORM DESIGN

The City of Côte Saint-Luc, in conjunction with academic and research partners and members of Quebec's health care profession, held several in-person public consultations and focus group discussions with a broad range of Côte Saint-Luc residents, their families, caregivers, and the staff who serve them. Consultations were intended to (and did) elicit feedback, concerns, and questions about the VillAGE Initiative in general, and privacy implications and concerns in particular. It should also be noted that, pursuant to this exhaustive engagement exercise and the implementation of the pilot project in the homes of five independent older adults, issues around privacy and security were raised. All of those concerns (see Chapter 6: Community Engagement) were addressed and integrated into the design of the project. For instance, feedback indicated that:

- The solutions offered need to be customized to each individual's level of comfort with technology in general and monitoring technologies in particular, since some participants will want monitoring via cameras and others not;
- The person who recommends devices and the one who does the installation must be trustworthy and accredited;
- The use and distribution of data must be totally secure and not available to any third parties without participants' explicit consent.

Residents who were consulted and those who participated in the pilot project understood that some risks (such as power failures or personal home intrusions) are unavoidable, but were prepared to play a role in managing risks in collaboration with the VillAGE team. The partnership with researchers (including those involved in the pilot project) was also seen as providing a positive ethical approach that could further enhance the design of the VillAGE Initiative.

7.4 OPENNESS AND BIG DATA

The City also believes that providing open access to project data about the VillAGE Initiative must—and can—be done in a manner that genuinely respects privacy and governing law; and that strategy can—and will—invite innovation using anonymized data in a way that genuinely respects individuals' privacy.

The VillAGE Initiative and the City will adopt a communication plan to explain to the public the policies and practices relating to the proposal's management and handling of personal information.

In addition, information management and other policies will be available online and by request as suggested in PPIA Recommendation 87—Access to Policies—ensure consent and notice provisions governing the collection, use, disclosure, and disposition of personal and health information through the VillAGE Initiative are made publicly available through the City website or a dedicated VillAGE Initiative website.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

7.5 FINAL COMPREHENSIVE PIA

As a fundamental component of developing the City's final proposal, we have addressed the privacy concerns through the Preliminary PIA and resolved issues that became apparent during the pilot project. For example, we prepared plain-language consent forms and pilot project participants were asked to sign both the City's consent forms and were invited to sign the consent for their information to be collected by our research partners from the Université de Montréal, whose consent forms are government approved.

If Côte Saint-Luc is selected as a winner of the Smart Cities Challenge, we will conduct a comprehensive Privacy Impact Assessment to ensure that VillAGE participants' information is adequately safeguarded, whether through collaborations with research and healthcare partners or in relation to the technology and devices employed in the VillAGE Initiative.

Furthermore we will rely on the advice and guidance of our major health partner, the CIUSS Centre Ouest-de-l'île de Montreal/Integrated Health Network for West Central Montreal, headed by Dr. Lawrence Rosenberg whose letter of support indicates its intention "to collaborate with Côte Saint-Luc in an advisory role regarding its program governance, alignment of technology roadmaps and data integration aimed at augmenting Patient Health records as well as information privacy protection."

This collaboration has already started in that they have shared with Côte Saint-Luc the policies, laws, regulations, and directives that will guide our information security and data governance once we begin to service those residents of our city who are patients in their health network.

This model of collaboration will serve other communities across the country when adopting the VillAGE platform.

7.6 PRIVACY COMMISSIONER OF QUEBEC

The City of Côte Saint-Luc submitted the draft PPIA to the Privacy Commissioner of Quebec (see letter in the Confidential Annex). After due consultation with the Privacy Commissioner's office, we revised the PPIA to address all of its concerns and included its recommendations.

7.7 RISK STRATEGY

The PPIA identified a broad range of risks and unintended consequences that could result from the creation and implementation of the VillAGE Initiative, and provided detailed recommendations and strategies to mitigate the risks, which are outlined in the four key findings:

Finding 1—Beyond the Baseline

The wealth of sensitive personal, health, and financial information that will be collected, used, and disclosed in the VillAGE makes it clear that it is incumbent upon both the City of Côte Saint-Luc and the VillAGE non-profit organization to go beyond the baseline requirements of the privacy laws.

Côte Saint-Luc must ensure that information is collected and disclosed at the right times, for the right reasons, to the right parties, and in the right amounts, and ensure that the personal information is protected against such risks as unauthorized access, collection, use, disclosure, disposal, and loss of use throughout its lifecycle and to a degree that is appropriate to the sensitivity of the data.

Finding 2—Prevention is Key

The intentional reliance on technology to enhance independent living demands adequate controls for securing all information in the VillAGE (regardless of its form or format) against unauthorized access, use, disclosure, loss, loss of use, and destruction. The importance of minimizing the personal and health information collected, and prop-

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

erly safeguarding it throughout its lifecycle, cannot be overstated.

Accordingly, it is essential to ensure that effective encryption is required in all elements of the VillAGE; that all VillAGE data be categorized and segmented, de-identified and encrypted at source, at rest and in transit through its entire lifecycle; that use by third parties be limited by non disclosure agreements and contracts that articulate strict limits on sharing, access by further third parties, and data location; and that both Privacy by Design and Privacy by Default be embedded and required as the de facto standard in all elements of the VillAGE so that it genuinely respects privacy while facilitating innovation and scalability.

Finding 3—Participants Must Be in Control of their own Information

The desired outcome of the VillAGE Initiative will rely on individuals voluntarily joining the VillAGE Initiative; but they will trust and use the "smart" VillAGE solution only if they are satisfied that it provides adequate confidentiality and privacy, and that it enables them to have explicit control over whether and what information about them is (and is not) collected, who has access to which parts of it, and that they can have access to their own information when they want or need it.

Finding 4—Maintain Primary Control over Information, and Control Secondary Uses

The collection, processing, storage, retention, and management of personal and health information might rely on third parties. Accordingly, it is essential that clear and unambiguous language limit vendors or other third parties from releasing/revealing personal/health information to subsequent parties, and that such limiting language be embedded in all agreements, bid processes, and purchasing policies/procedures relevant to the VillAGE Initiative.

Comprehensive protection of personal and health information can be attained—throughout the data lifecycle—by the City of Côte Saint-Luc creating a separate organization to manage the VillAGE Initiative, thereby facilitating data sovereignty and ensuring that VillAGE data would continue to be subject to data protection and access rights and responsibilities applicable to the City.

Chapter 8 FINANCIAL

8.1 INTRODUCTION

This chapter describes the five-year financial plan for the VillAGE Initiative program including estimates for expenses and revenues along with a detailed financial analysis. This financial plan adopts a top-down forecasting approach.

Program Overview

The VillAGE Initiative program is comprised of five projects and 40 core activities focused on the implementation of a Connected Framework in the City of Côte Saint-Luc as defined in the Challenge Statement and aligned with milestones payments for outcome achievement defined in the Performance Measurement chapter.

Management and Oversight

The VillAGE Initiative management and oversight for accounting and financial projections will be the responsibility of the Chief Financial and Operations Officer (CFO).

8.2 PROGRAM COST ESTIMATES

The total estimated cost for the VillAGE Initiative program over five years is $10 million with a $405,000 in-kind contribution from the City of Côte Saint-Luc, which covers half of the CEO's salary ($375,000) and the first two years of rent ($30,000). The first table shows the breakdown by project (totals have been rounded to the dollar). The second table shows expenses by category.

Project	Total five-year cost in $CAD
Governance and Operations	$3,170,000
Community Engagement	$1,128,250
Platform Development	$3,362,000
Service Delivery	$1,719,500
Sustainability & Transferability	$629,250
TOTAL	**$10,000,000**

Table 8-1: Cost Breakdown by Project

Expense Category	Total five-year cost in $CAD
Management Costs	$6,965,000
Human Resource Costs	$867,000
Operating Costs	$2,195,000
TOTAL	**$10,000,000**

Table 8-2: Cost Breakdown of Expenses

Management Cost Allocation

Members of the Management Team, while defined in the Governance and Operations project, would allocate their time and work across projects according to their skillsets and expertise. Cost estimates have been allocated in the table below.

Management	Revenue Allocation in %	Annual Salary
CEO	40% Governance and Operations 35% Community Engagement 10% Service Delivery 15% Sustainability	$150,000 ($75,000 in-kind by the city)
CTO	40% Governance and Operations 40% Platform Development 10% Service Delivery 10% Sustainability	$150,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Management	Revenue Allocation in %	Annual Salary
Admin	40% Governance and Operations 20% Community Engagement 20% Service Delivery 20% Platform	$60,000
Marketing and Communications Coordinator	20% Governance and Operations 50% Community Engagement 30% Service Delivery	$50,000
Chief Financial and Operations Officer (CFO)	50% Governance and Operations 20% Community Engagement 10% Service Delivery 15% Sustainability	$120,000
Director of Community Engagement & Service Delivery	20% Governance and Operations 40% Community Engagement 40% Service Delivery	$100,000
Fundraising and Sustainability Manager	10% Governance and Operations 80% Sustainability	$75,000 starting second year

Table 8-3: Management cost allocation

Assumptions and Cost Estimating Methodology

Cost estimates were developed by breaking down each project into four major categories: (1) conception and planning, (2) implementation and operational results, (3) monitoring performance indicators, and (4) contingency and risk mitigation. The methodology for each element is further described below.

Cost Elements	Assumptions	Estimated % of Costs—five years
Conception and Planning	Final conception and planning of all projects and services are estimated at 85% of the total costs of management, additional resources and operating costs the first year and 25% each year after	$3,143,350
Implementation and Operational Results	All implementation and operational results are estimated at zero of the total costs of management, additional human resources and operating costs the first 12 months and at 62% each year after	$5,558,920
Monitoring Performance Indicators	Monitoring and reporting performance indicators per project costs are estimated at 10% of the total costs of management, additional human resources and operating costs for the five years	$1,002,700
Contingency and Risk Mitigation	Contingency and Risk Mitigation costs are estimated at 3% of the total five-year costs	$300,810

Table 8-4: Cost Elements and Assumptions

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

8.3 FINANCING AND REVENUES

8.3.1 Introduction

This section presents the projected funding required to complete the program including projected revenues and assumptions.

8.3.2 Financial Plan Overview

This Projected Financial Plan reflects the planned funding strategy through which the VillAGE Initiative will be financed. This includes the $10 million start-up fund financed by Infrastructure Canada through 13 milestone payments and revenue generated from a number of sources to ensure sustainability and scalability in the long-term. These sources include user fees from smart device solution sales, partner subsidies, government grants, planned giving, endowment donations, and premium solution support services

With the aim of funding for sustainability, we have had a number of active discussions with financing partners who would provide additional capital to a $10 million prize from the Smart Cities Challenge. For instance, MEDTEQ have strong interest in supporting the VillAGE Initiative should we be a winner in the Smart Cities Challenge, as evidenced by their letter of support. MEDTEQ is the Industrial Consortium for Research and Innovation in Medical Technologies, which accelerates the collaborative development of innovative technologies for clinicians and patients and their validation and integration into Canadian and international health networks. Their support could include in-kind contributions as well as cash contributions of $500,000 per project year over three years (up to $1.5 million per approved project).

The letter of support from Concordia University confirms their strong interest in supporting the VillAGE Initiative. As a founding partner of MEDTEQ, Concordia University is open to providing in-kind resources, research grants and high-leverage project structuring to offer multiple matching funds to a $10 million prize from the Smart Cities Challenge.

We have included a full-time Fundraising and Sustainability Manager in our plan, starting in year 2, who would be focused on ensuring the achievement of our fundraising objectives towards short-, medium-, and long-term sustainability of the VillAGE Initiative.

The following table shows our revenue assumptions in more detail.

Description	Revenue Assumptions	Total Estimated Revenue for five years
Smart Device Solution Sales	Starting the fourth year, we estimate that 600 residents will purchase our smart device solutions at $1,200 annually for a total of $720,000, representing 10% of the 6,000 older adults who live alone in our city. Starting the fifth year, we estimate that 1,200 residents will purchase smart device solutions at $1,200 annually for a total of $1,440,000, which represents 15% of 6,000 residents + 50% (300) repeat customers from the previous year. We are working, through our partner financing efforts, to put in place a subsidy program for residents to purchase these solutions, based on income level and other factors.	$2,160,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Description	Revenue Assumptions	Total Estimated Revenue for five years
Partner Subsidies, Research Grants, Government Grants, Foundations	Starting the third year, we estimate based on our currently strong level of interested partners that we will be able to confirm three partner subsidy agreements: • $500,000 (third year) • Research and other government grants $1 million (fourth year) • Foundations: $500,000 (fifth year)	$2,000,000
Planned Giving and Endowment Funds	Starting the third year, we estimate, based on strong existing relationships with foundations that we will be able to set up a planned giving program and a VillAGE Initiative endowment fund: • Planned giving: fourth and fifth year • $50,000 each year for a total of $100,000 • Endowments: third, fourth, and fifth year: 20 donations at $1,000 each for a total of $20,000 each year	$160,000
Solution Support Services	Starting in the fifth year, we estimate that we will generate revenue from providing solution support services to (a minimum of) five cities in Canada at $50,000 each.	$250,000
	TOTAL	**$4,570,000**

Table 8-5: Revenue Assumptions

8.3.3 Financing Strategy

The projected financing strategy, or combination of financing approaches, will depend on market circumstances. However, we have developed a preliminary financing plan based on currently available program data and market circumstances. To the extent that additional data becomes available or market circumstances change, we will update the financial plan to account for these changes. See below for the financial details per project for the five years as well as the detailed financials of all the costs and the financial analysis summary of the revenues and costs for the five years.

8.3.4 Estimated Revenues Beginning Third Year

We will use the estimated revenue sources to finance additional human and material resources in three key projects: community engagement, platform development and service delivery. We anticipate an increase in:

- the number of older adults who will want to receive information on services and updates both in person and online;
- the number of lower-income older adults who might require subsidies to offset the monthly fees of their smart device solutions including hardware;
- the number of older adults who will want to purchase smart device solutions.

In all three cases, additional occupational therapists, case managers, smart device installers, help desk personnel, platform developers and hardware will be required. Additionally, with the MEDTEQ partnership, research and development of innovative applications and solutions to foster autonomy and a quality of life for older adults and their caregivers will be possible.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

8.4 ASSUMPTIONS, RISKS AND MITIGATION

The projected financial structure for the program includes the revenues that will be raised by the third year and milestone payment proceeds to pay for project conception and planning, implementation and operational results, monitoring performance measurements and contingency and risk mitigation phases by Infrastructure Canada.

The funding available for the project will be subject to risks that cannot be fully known at the time of this writing. The following is a summary of potential risks that may affect the financing of the project as well as the risk allocation analysis when assessing each project's advancement and delivery.

Risk	Mitigation
Liquidity Risk	Clearly define and execute outcomes-based performance agreement with Infrastructure Canada to ensure timely payments at milestones.
Longevity Risk	Clearly define and execute long-term revenue and financing outcomes to ensure sustainability of the VillAGE Initiative in fundraising and partner subsidy agreements.

Table 8-6: Risks and Mitigation Plan for Financial

8.4.1 Risk Allocation Analysis

The VillAGE Initiative will use a two-step screening process when assessing each project's advancement and delivery. In the first-step screening phase, project information and data are reviewed and assessed against a set of second-step screening criteria to determine feasibility and readiness of each. A project that does not meet some or all the first-step screening criteria may not advance or still may advance based on other considerations.

Project Deliverables	Is timeline of project activities realistic, with the right target and in allocated budget?
Funding Requirement	Does the project have revenue generation potential to partially offset the initial public funding?
Project Team	Does the project have all the necessary human resources to complete the deliverables?
Project Efficiencies	Is there an opportunity to bundle projects or create economies of scale?
Ability to Raise Capital	Can the outputs/deliverables help free funds or leverage existing sources of funds?
Ability to Transfer Risk	Can project help transfer risks and potential future responsibilities to the private sector on a long-term basis?

Table 8-7: First-step Screening for Risk Allocation Analysis

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Page 561 of 1849

Community Need	Does the project address the needs of the community? Does the project support improving the quality of life for older adults?
Community Benefits	Will the project bring wellness and social resilience benefit to the community? Does the project help achieve performance, and safety as outlined in Challenge Statement?
Social and Economic Development	Will the project enhance the City's social and economic development objectives?
Market Demand	Is there sufficient community appetite for the project—isolated older adults, caregivers, healthcare providers, etc.?
Stakeholder Support	What is the extent of support for the project? What strategies are proposed to involve partners, governments, and foundations in the project?
Legislative Considerations	Are there legislative considerations that must be considered?
Technical Feasibility	Is the project described in enough detail to determine the type, size, location, and proposed dependencies?
Project Risks	Are there any risks unique to the project that have not been outlined that could impair project viability?

Table 8-8: Second-step Screening for Risk Allocation Analysis

8.5 REPORT ON THE USE OF THE FINALIST GRANT, INCLUDING REASONABLE JUSTIFICATION OF ANY DIVERGENCES FROM THE PLAN LAID OUT IN THE APPLICATION

We did not fundamentally diverge from the core concept in our initial proposal, the SHARED (Senior Health and Real-time Environmental Data) Initiative, which was focused on leveraging and implementing smart devices and data technologies to keep isolated older adults safer, healthier, and more connected to city services while living at home.

As you will see in the attached Final Revised Budget, we applied the $250,000 finalist grant towards expenses mainly focused on consulting, professional services and various communications needs. The cost of equipment and technical services are far less than what we originally projected in the preliminary proposal.

Once we were selected as finalists, we set out to find advice from business and technology experts. In keeping with our municipal rules and best practices, we sought out competitive bids for the principal responsibilities of project management and technology strategy.

The first contract was given to Innovitech, a company with more than 25 years of experience as innovation strategists. We mandated Innovitech to assist us in developing the SHARED concept and mobilize key research, industry, academics, entrepreneurs and clinical partners in the field of medical technology and digital health. Through their initial mandate, we were introduced to a series of academics, researchers and government agencies. As well, we were invited to present and participate in an Innovation Summit on Medical Technology and Digital Health organized by Innovitech and MEDTEQ in January 2019.

In the summer of 2018, we hired Marc Chriqui from Delevante Software Inc. to be our Project Director and direct the development of the final proposal from concept to implementation of the pilot phase. Marc drove the finalist phase and oversaw every detail of the process from developing partner relations to researching technology, to making repeated presentations and participating actively in

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

community engagement and drafting and preparing the final proposal. His compensation is based on monthly consulting fee.

Other professionals hired included Amina Inc. for the Privacy Impact Assessment. Erica Botner, Public Engagement Coordinator, was hired to work on engagement and oversee our pilot project. We also hired a public engagement animator for our city-wide engagement consultation and hired a professional business writer to help with the final drafting of the proposal.

Videography, legal fees and translation round out the professional services expenses. As can be seen from the final revised budget, hardware and equipment were not major expenses and this is in stark contrast to the initial budget that was presented in the initial application.

The major variance between the final revised budget for the finalist grant and the initial budget as proposed can be explained as follows:

The budget for the initial proposal of the SHARED project was very focused on sophisticated and expensive environmental, home and mobile sensors. The proposal was to run a "Living Lab" pilot project involving 100 isolated older adults, equipping their home with sensors, and personal GPS/fall sensors to trigger city services using a decision-making server that uses machine learning combined with an expert system. We also budgeted for the installation of an environmental sensor grid to test the solutions ability to monitor air and noise pollution.

Once we were selected as a finalist, it soon became apparent that this initial project was overly ambitious for the relatively short finalist phase. After consultation with our population, it was understood that the environmental monitoring was not a top priority for our residents in the initial phase of the project.

A total of 73 percent of the initial budget was focused on hardware, based on a very optimistic number of pilot participants and environmental sensors. This number turned out to be a logistical challenge, which we could not address based on the guidelines and recommendations of the Smart Cities Challenge.

As we understood from the start of the finalist phase, the pilot projects could only be implemented once we had conducted a thorough exercise in community engagement of our residents in order to really understand their needs and priorities. As well, we had to assess and evaluate the technical products that were readily available in the market, without the restrictions of licensing, non-compete and NDA agreements. The initial companies who we approached were very reluctant to allow us to integrate their devices in our pilot homes without very restrictive conditions, which we could not accept.

In the time available and based on feedback from community engagement, we preferred to focus on quality over quantity. The DOMUS Laboratory at the University of Sherbrooke offered us their connected home solution, equipment and expertise at a very fair price. This equipment is relatively inexpensive and the platform is based on open technologies that can be adapted to a diversity of older adults and home types depending on their needs.

Furthermore, we had to adopt protocols for the selection of pilot participants, which were also based on consent and privacy considerations that took time to implement. This included home interviews and assessment of needs. In order to customize the devices to the requirements of the users, we relied on the expertise of our Public Engagement Coordinator.

This explains the variance between the original budget and the revised budget. The former was based in large measure on hardware and technology while the later was to acquire professional services for strategic business development, project management and intensive community engagement.

Chapter 9 IMPLEMENTATION PHASE REQUIREMENTS

Should we be selected as a winner in the Smart Cities Challenge, the City of Côte Saint-Luc intends to work with its existing partners and future partners to identify and meet all regulatory reporting and legislative policy requirements. This chapter outlines our plan with regard to the requirements as outlined in the Finalist Guide.

9.1 DUTY TO CONSULT WITH INDIGENOUS GROUPS

The City of Côte Saint-Luc is located on the island of Montreal, which is situated in Mohawk (Kanien'keha:ka) and Iroquois Territory. The City has already reached out to the Health and Social Services of James Bay (Cree Health Board) to gauge their potential support. The Cree Health Board has shown interest. This will allow us to further offer this program to Indigenous groups and remote communities and involve them in the initial phases of the Initiative. We do not see any potential adverse impact to the Treaty holders in and around our community. On the contrary we see many potential benefits. We have some 40 residents in our community that have self-identified as Indigenous[7]. Should we be selected as a winner, we will reach out to these residents and ask them to participate in the initial phases of implementation if their families and elders see a potential benefit in participation.

9.2 COMMUNITY EMPLOYMENT BENEFIT (CEB)

In compliance with the Community Employment Benefit (CEB) program which applies to the winners of the Smart Cities Challenge, Côte Saint-Luc has already partnered with two organizations that are committed to recruiting and finding employment opportunities for a variety of targeted groups that are included in the CEB program. Both these organizations already collaborate with Côte Saint-Luc in that they directly service our residents with their business counselling and job placement services.

Agence Ometz is a well-established non-profit organization in the west-end of Montreal. It offers a variety of counselling services for job seekers and entrepreneurs. Agence Ometz provides a full range of employment services to special needs job seekers, from skills training to job search assistance. It also offers services for employers to help them find qualified candidates with specialized skills. Agence Ometz also offers coaching for social enterprises and startups including courses on how to start a business and provides services for newcomers to help new arrivals to Montreal establish their lives in Canada through a range of services, from integration activities to employment services. Agence Ometz is accredited by the Ministère de l'Immigration, de la Diversité et de l'Inclusion (Quebec's Ministry of Immigration) to provide these settlement and integration support services to new immigrants. Please see Appendix for letter of support from Agence Ometz.

We have also partnered with **PME Centre-Ouest** which services Côte Saint-Luc and other west-end cities and boroughs on the island of Montreal. This organization is part of a government financed network of offices on the island that offers coaching, training and financing for entrepreneurs, and training and coaching for job seekers.

As a member city that sits on the Governing Board of the PME Centre-Ouest, Côte Saint-Luc has consulted with their advisors about the Smart Cities proposal and is in close contact with their counsellors and advisors who will be able to direct potential candidates to the VillAGE Initiative.

Once the VillAGE Initiative is launched we will work with these two organizations in order to meet the requirements of the CEB program. In particular we will:

- Focus on recruiting new immigrants who are often skilled technicians and very well suited to learn how to install and develop smart home devices for seniors;
- Target youth for a variety of employment opportunities, especially in the technology domain and service delivery;
- In our contracts for procurement of services, we will give first consideration to social enterprises.

[7] Profil Sociodemographique, 2016, http://ville.montreal.qc.ca/pls/portal/url/ITEM/538113131BC71046E0530A9301321046

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Women already represent a majority of Côte Saint-Luc city management and are planned to have a significant role in the VillAGE Initiative non-profit organization as well. We are therefore not focused on affirmative action for women, however we will continue to recruit new staff and employees without any gender bias.

9.3 CLIMATE LENS ASSESSMENT (CLA)

Whereas the VillAGE Initiative does not deal directly with greenhouse gas mitigation or climate change adaptation, there is no obligation or relevance on our part to undertake GHG mitigation assessment, or the climate change resilience assessment to respond to climate change related disruption or impact. However we would simply add that over the long term our project aims to implement environmental monitoring into the connected network linking seniors to city and social health services. Once deployed these environmental sensors for temperature and air quality will give us better indication of the impact of air pollution and extremes in weather, which would inform our policies and programs regarding GHG reduction and climate change resilience.

9.4 OTHER APPLICABLE LAWS, REGULATIONS, AND POLICIES

Managed by the Société d'habitation du Québec, the Programme d'adaptation de domicile (PAD) provides financial support for the home adaptation projects for people with disabilities. The goal is to allow people with physical disabilities to enter and exit their home, perform their daily routines, and therefore continue to reside in their own home more safely and securely. Financial assistance may be as much as $16,000 per eligible person. The admissible work is determined by the municipal partner based on the terms of the program and the recommendations made by staff from the Local community services centres (CLSC), which often takes months of waiting, or costs residents out of pocket for a private occupational therapist. We will expedite the process by providing home assessment as one of the services offered by the VillAGE Initiative. This assessment will be performed by an occupational therapist that we will have on staff. This is, in fact, part of our mandate as we already are partners in the PAD program. In addition, the City of Côte Saint-Luc will ask the Société d'habitation du Québec (SHQ) to include technological devices such as sensors as part of the program, as they are just as useful and important for safety and security as bars and physical adaptation tools.

9.5 RISKS AND MITIGATION MEASURES

Risk	Risk Mitigation Plan
Indigenous population in Côte Saint-Luc not known, difficult to find, potentially reluctant to engage with the City.	• Make strong attempts through social media and print media to specifically invite Indigenous residents to a focus group. • Contact Mohawk Nation for community consultation.
As the population being served is vulnerable, this raises issues regarding the quality of service delivery people going into their homes.	• Do police checks on all hires. • Create language and use personality tests for service delivery people and ensure that employees receive customer service training related to seniors. • Create a training program for technical skills, since many of the technologies that will be applied are new. • Ensure that each service delivery person receives intensive training on VillAGE privacy policies.
The Societe d'habitation du Québec (SHQ) may refuse to expand the PAD program to include smart home devices, reducing accessibility of VillAGE services.	• Obtain letters of support that document the health and importance of the tech tools from our health and research partners and present them to the SHQ. • Produce a cost benefit analysis showing value of VillAGE as it reduces costs for government health and social services. • If necessary, create public awareness campaign related to this.

Table of Contents

Glossary of Key Terms 3

Executive Summary 4
- Reimagining our shared mobility future 4
- Solving critical challenges 5
- A culture of collaboration 6
- Why should we win? 6
- Outcomes-focused implementation 7
- Proposal preview 8
- Conclusion 8

CHAPTER 1 - Vision 9
- 1.1 Greater Victoria at a crossroads 9
- 1.2 A shared vision for smart mobility 9
- 1.3 Our Smart Mobility Program 10
- 1.4 Bringing "Citizen-Inspired Transformation" to life 11
- 1.5 Co-design target groups 11
- 1.6 Why should we win? 14

CHAPTER 2 - Technology 16
- 2.1 Technology plan for our SMP 16
- 2.2 Future-proofing and scalability 23
- 2.3 Compliance and standards 24
- 2.4 Technology partners 24
- 2.5 Inclusivity and accessibility 24
- 2.6 Risk mitigation 25

CHAPTER 3 - Governance 26
- 3.1 Introduction 26
- 3.2 Governance framework 26
- 3.3 Looking to the future 31
- 3.4 Risk mitigation 31

CHAPTER 4 - Engagement 32
- 4.1 Introduction 32
- 4.2 SIPP engagement approach 32
- 4.3 Engagement to date 33
- 4.4 Engagement plan for implementation phase 36
- 4.5 Engagement methodologies 37
- 4.6 Diversity and inclusion framework 38
- 4.7 Risk mitigation 39

CHAPTER 5 - Data and Privacy 40
- 5.1 Data and our projects 40
- 5.2 Data and privacy plan 43
- 5.3 Risk mitigation 47

CHAPTER 6 - Project Management 48
- 6.1 Introduction and approach 48
- 6.2 Scope, schedule, sequencing and dependencies 50
- 6.3 Resourcing 52
- 6.4 Stakeholders 54
- 6.5 Procurement plan 54
- 6.6 Communications 55
- 6.7 Sustaining projects beyond the Challenge 56
- 6.8 Risk mitigation 56

CHAPTER 7 - Performance Measurement 58
- 7.1 Outcomes-based performance measurement framework 58
- 7.2 Risk mitigation 66

CHAPTER 8 - Implementation Phase Requirements 67
- 8.1 Reporting and legal requirements 67
- 8.2 Risk mitigation 69
- 8.3 Freedom to move: from vision to implementation 70

APPENDICES
- Appendix 1 — Finance
- Appendix 2 — Privacy Impact Assessment
- Appendix 3 — Letters of support
- Appendix 4 — Confidential Annex

We are grateful to be doing our work on the territories of the Coast Salish and Nuu-chah-nulth peoples, known today as Lkwungen peoples (Esquimalt and Songhees Nations), W̱SÁNEĆ Nation (consisting of SṮÁUTW̱–Tsawout, BOḴEĆEN – Pauquachin, W̱ JOŁEŁP – Tsartlip, and W̱SIḴEM – Tseycum Nations), Sc'ianew Nation (Beecher Bay), T'Sou-ke Nation, and Pacheedaht Nation. We respect and, in partnership, build on the traditional knowledge of the Indigenous peoples who have thrived and prospered in the South Island for millennia.

Glossary of Key Terms

Co-design target groups:
The three priority populations for the Smart Mobility Program

- Seniors
- Indigenous students
- New employees

Indigenous Smart Mobility Pilot:
Mobility as a Service pilot project for Indigenous students

Initial proposal:
SIPP's first submission to the Smart Cities challenge

Mobility Wellness Index (MWI):
A unique performance tool SIPP developed to measure impacts on people's physical, emotional and financial wellness resulting from mobility improvements

Program Management Office (PMO):
The entity charged with managing the Smart Mobility Program

Scaled Agile Framework (SAFe):
Project management model adopted for delivering the Smart Mobility Program

Smart Mobility Program (SMP):
Overarching program comprising our three projects

- Project 1: Integrated Mobility as a Service (MaaS)
- Project 2: Smart Trip Planning and Single Payment Platform (STP)
- Project 3: Smart South Island Inspiration Centre (SSIIC)

South Island Prosperity Partnership (SIPP):
A private not-for-profit organization that serves as the economic body for Greater Victoria and the entity submitting this Smart Cities Challenge application

Stage Gates:
Project phases, defined by key milestones in program delivery and evaluation

- Stage Gate 1: Minimum Viable Product / Pilot
- Stage Gate 2: Iterative Development
- Stage Gate 3: Rollout
- Stage Gate 4: Operate and Scale (post-SCC)

Acronyms:

API: Application Programming Interface

CIO: Chief Information Officer

CTO: Chief Technology Officer

KPI: Key Performance Indicator

MaaS: Mobility as a Service

MFA: Multifactor Authentication

MWI: Mobility Wellness Index

MVP: Minimal Viable Product

NFP: Not-for-Profit organization

P3: Public-Private Partnership

PII: Personally Identifiable Information

PIPA: Personal Information Privacy Act

PMO: Program Management Office

SAFe: Scaled Agile Framework

SCC: Smart Cities Challenge

SIPP: South Island Prosperity Partnership

SMP: Smart Mobility Program

STP: Smart Trip Planning and Single Payment Platform

SSIIC: Smart South Island Inspiration Centre

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Canada's Smart Cities Challenge

Aerial view of Fort Street and Cook Street, Victoria

Greater Victoria is proud to be united behind a vision for a new, shared mobility future that is convenient, green, affordable, inclusive and improves the prosperity and wellbeing of its citizens. Our vision will be achieved by using smart city technologies, but also by bringing our tagline "Citizen-Inspired Transformation" to life, so that our communities and many others across Canada can realize the benefits of improved mobility.

We are grateful for the support and contributions of our 117 partners, including 13 funding partners, six program partners, 14 funded development and research partners and 84 collaborative partners. This proposal has—without a doubt— been made infinitely better through their participation and involvement. Our momentum and collective will to solve our pressing mobility challenges has never been stronger.

With our rich array of partners, our governance model, our commitment to outcomes that matter to our citizens, and our measured implementation approach, we will not only ensure that our projects are well-executed but also that they are meaningful and transformative to our region and Canada.

It is with pleasure that the South Island Prosperity Partnership (SIPP) shares its vision and implementation plan for a Smart Mobility Program (SMP) in the forthcoming chapters.

REIMAGINING OUR SHARED MOBILITY FUTURE

Through Canada's Smart Cities Challenge, we will showcase how smart mobility can be a local and global model—through connected and innovative technologies that are co-designed by our citizens to ensure everyone enjoys the "freedom to move." Our guiding challenge statement is:

> "To achieve each person's "freedom to move," we will collaboratively create a multimodal transportation network that is convenient, green, and affordable, which will boost South Islanders' mobility wellbeing score by at least 20%."

Our Smart Mobility Program (SMP) is comprised of three ambitious projects designed to not only achieve our vision, but be scaled elsewhere. These are measured through our five key outcome themes, detailed on page 7.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- PROJECT 1 – Delivery of Integrated Mobility as a Service (MaaS)
- PROJECT 2 – Smart Trip Planning and Universal Payment Scheme (STP)
- PROJECT 3 – Smart South Island Inspiration Centre (SSIIC)

This proposal is directly guided by the needs, aspirations and wisdom of our citizens. It reflects SIPP's ongoing pledge to advance "Citizen-Inspired Transformation" throughout Greater Victoria. Leading up to this proposal, SIPP facilitated over two years of resident and stakeholder engagement culminating in Vision 2040, a regional roadmap to guide how connected technologies and data should be used to improve our lives and community wellbeing.

Our SMP reflects mobility priorities identified by citizens in Vision 2040, and provides an innovative blueprint for how our communities, provincially and nationally, can leverage smart technologies to achieve meaningful social, economic, health and environmental outcomes.

SOLVING CRITICAL CHALLENGES

At a high level, our vision addresses the most critical challenges faced by many cities across the world: rising unaffordability, aging populations, and climate change in the context of population growth, decaying infrastructure and fractured governance systems.

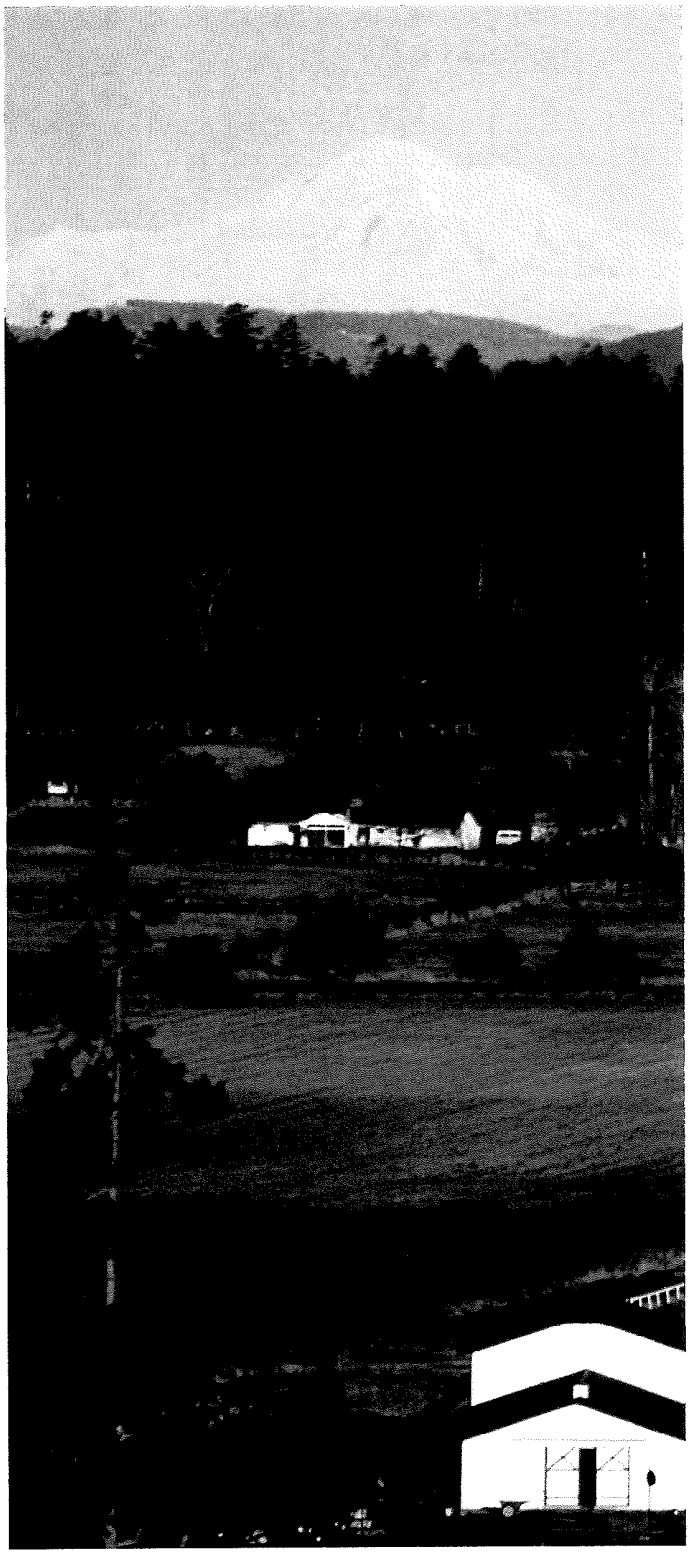
Our SMP takes this down to the citizen level by linking one particular solution—mobility freedom—to these challenges. An aging population means increased social isolation. Rising unaffordability means vulnerable populations move farther away from the economic base they need to thrive. Climate change means the personal automobile is no longer an acceptable option for everyone in the long-term. Fractured governance means coordinating solutions to these problems—in ways that are inclusive and effective—are more difficult.

Improving our collective access to mobility freedom, starting with our most vulnerable populations, is a journey to achieving broad economic, social and environmental outcomes.

Bike lanes and bike racks in downtown Victoria

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

A CULTURE OF COLLABORATION



Founded in 2016, SIPP is a public-private partnership designed to engage governments, businesses, institutions, industry associations and nonprofits toward a sustainable regional economy. SIPP membership comprises 10 municipal governments, seven First Nations communities, three post-secondary institutions, seven industry associations and nonprofits, and 24 large employers. Our unique governance approach aligns closely with the Smart Cities Challenge approach, promoting openness, integration, transferability, and collaboration.

To reflect our steadfast commitment to collaboration, our name has been updated from the South Island Prosperity Project, in our initial SCC proposal, to the current South Island Prosperity Partnership. SIPP's diverse and inclusive membership is critical to the development and successful implementation of our SMP and also makes us resilient by never being reliant on a single partner.

WHY SHOULD WE WIN?

Our vision chapter captures our commitment to deliver truly transformative change through our SMP mobility improvements. This is evidenced by swift, well-coordinated implementation and delivery, and rich engagement through our co-design process with key targeted populations. Our project management model and outcome-based feedback loop will provide the quick wins required to build momentum. SIPP's policy framework for data privacy and security will be central to maintaining data integrity for the public and our partners, while also providing guidelines for selecting the smart technologies we employ to deliver transformative change.

Our solutions are designed not only to be innovative, by integrating mobility, data and connected technologies, but also highly exportable ideas that can solve the mobility needs of Greater Victoria and beyond. Our ideas and outcomes alike will be shared with our regional, national and international partners in hopes that our successes will be modelled and scaled elsewhere.

Saanich landscape

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

OUTCOMES-FOCUSED IMPLEMENTATION

We will measure our progress and success against these five outcome statements, which were identified through community consultation and stakeholder engagement. These outcomes are also captured in a highly engaging and public-facing tool we developed called the Mobility Wellness Index, the first of its kind in Canada.

Convenience: With more convenient, accessible multimodal transportation options enabled by smart technology, residents with access to convenient alternatives to single occupancy vehicles will increase by at least 20% by 2024.

Affordability: With improved multimodal transportation options and trip planning enabled by smart technology, residents will spend, on average, less than 10% of their annual household incomes on transportation.

Wellbeing: With multimodal transportation options and planning enabled by smart technology, the number of daily trips made by active and healthy travel modes (i.e., walking, transit, cycling) will double by 2024 over the current baseline, and average levels of reported trip satisfaction in the region will rise 10%.

Green: Due to shifts in number of per capita daily trips taken with personal automobiles towards daily trips per capita taken with alternative travel modes, per capita vehicle fuel consumption will decrease by 15% by 2024.

Inclusivity: As a result of improved and more integrated multimodal transportation options and trip planning enabled by smart technology, 20% more low-income residents will report improved access to their places of education, services and/or employment by 2024.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

PROPOSAL PREVIEW

Our proposal is designed to first share **what** our vision for a smart mobility future looks like in Chapters 1–2, followed by **who** will be leading and engaged in the implementation plan in Chapters 3–4, and finally **how** we will implement it and achieve our stated outcomes in Chapters 5–8. Appendices follow, which encompass our Finance Chapter and documents supporting our submission.

- **Chapter 1 – Vision**: Our shared vision, co-design target groups, user journeys and win themes
- **Chapter 2 – Technology**: Our SMP project and technology plan details, compliance and standards, risk mitigation, linkages to outcomes
- **Chapter 3 – Governance**: Our unique SIPP and SMP governance frameworks, partnerships, and oversight, risk mitigation, linkages to outcomes
- **Chapter 4 – Engagement**: Our deep engagement to date, key findings, engagement plan for implementation phase, diversity and inclusion framework, risk mitigation, linkages to outcomes
- **Chapter 5 – Data and Privacy**: Our validated data approach, sources, data and privacy plans and compliance, risk mitigation, linkages to outcomes
- **Chapter 6 – Project Management**: Our Scaled Agile Framework, outcomes-based feedback loop, work plan strategy and schedule, core team and stakeholders, procurement plan, future-proofing, risk mitigation, linkages to outcomes
- **Chapter 7 – Performance Measurement**: Our outcome-based performance measurement framework, reveal of the Mobility Wellness Index, monitoring and evaluation plan, risk mitigation, linkages to outcomes
- **Chapter 8 – Implementation Phase Requirements**: Our reporting and legal requirements, risk mitigation, linkages to outcomes
- **Appendices**
  - Appendix 1: Finance Chapter
  - Appendix 2: Privacy Impact Assessment
  - Appendix 3: Letters of Support
  - Appendix 4: Confidential Annex

CONCLUSION

The time to do something about our mounting mobility challenges is now. For the first time in its history, our region is unified around a common goal. The Smart Cities Challenge is critical to bring this concept to reality for our citizens and, more importantly, the vulnerable populations who are being left out of our region's and Canada's collective prosperity.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 1
Vision

"Vision without action is merely a dream. Action without vision just passes the time. Vision with action can change the world."
– Joel A. Barker

1.1 GREATER VICTORIA AT A CROSSROADS

Across the globe, mobility choices touch every aspect of life: from where we live and how we access services and education, to where we work, our quality of life and wellbeing. Simply put, mobility choices give us freedom; or, conversely, a lack of mobility choice restricts that freedom and has a profound impact on how our lives are shaped. To address this complex issue, Greater Victoria is moving full steam ahead toward a new Shared Mobility future. But what does that mean, and how will this bridge a way forward for all Canadians?

Imagine a young Indigenous student hitchhiking to college or, in an emergency, spending half of his monthly income to take a taxi ride into town. Imagine a senior on a fixed income living in isolation because she can no longer drive. Imagine a new employee who recently relocated to Greater Victoria trying to establish himself, struggling to find affordable housing close to transit so that he can spend more time with his family and less time commuting. These are just a few of the compelling stories we heard from our community—stories that will be familiar to all Canadians.

Every year it gets harder for many Canadians to preserve our high quality of life: today's commutes are longer; traffic congestion and our dependence on personal vehicles is increasing; cities are sprawling, and housing costs are soaring. Meanwhile, those on the periphery—seniors, Indigenous people, persons with disabilities, minorities, immigrants and low-income families—struggle to access the mobility services that would improve their quality of life.[1]

Greater Victoria is at a crossroads. With rising unaffordability, rapid population growth, overlapping jurisdictions and mandates and constrained and aging infrastructure, we face imminent challenges. But there is good news. We have also never before in history had access to so many innovative approaches to solving our citizen's challenges through the use of new technologies, data and digital infrastructure.

Now is the time to make community investments in digital infrastructure that scales and will help all Canadian communities design their own transformative 21st-century mobility solutions

Emboldened by Canada's Smart Cities Challenge, Greater Victoria and its vast network of public and private partners is ambitiously reimagining a new, shared mobility future for all of Canada: a future where our citizens—of all ages, abilities and means —are empowered with the "freedom to move."

1.2 A SHARED VISION FOR SMART MOBILITY

Our vision for Greater Victoria is a shared mobility future that is convenient, green, affordable, inclusive and improves the prosperity and wellbeing of our citizens. SIPP's tagline "Citizen-Inspired Transformation" is the foundation of our vision for a new mobility future in Greater Victoria that is designed by and for people, and provides an innovative blueprint for how our communities —in British Columbia and across Canada—can realize the benefits of improved transport, social and economic mobility. Driven by our vision and aspirations for Greater Victoria's mobility future, our Smart Cities Challenge Statement presented in the initial proposal is as follows:

"To achieve each person's "freedom to move," we will collaboratively create a multimodal transportation network that is convenient, green, and affordable, which will boost South Islanders' mobility wellbeing score by at least 20%."

We will measure our progress toward our challenge statement in five key outcome themes identified through community and stakeholder consultation and engagement: (1) convenience, (2) affordability, (3) wellbeing, (4) green and (5) inclusivity. Since our initial proposal, we have added an 'inclusivity'

1 Assessing and Measuring the Factors affecting Mobility, Transportation Accessibility and Social Need, research report by University of Toronto for Metrolinx, http://www.metrolinx.com/en/regionalplanning/rtp/research/Assessing_and_Measuring_the_Factors_Affecting_Mobility_Transportation_Accessibility_and_Social_Need.pdf

apter 7, including the development of
Mobility Wellness Index (MWI).

ool we have designed to meaningfully
cts that mobility systems have on
al, emotional and economic wellbeing.
e American Public Transportation Association (2017), vulnerable populations (e.g. women, low-income persons, seniors, new immigrants, persons with disabilities) are most reliant on public transportation. However, more research is needed to show that these populations are also more vulnerable to first-mile/last-mile challenges. With a focus on inclusive outcomes, our research will help address this knowledge gap. The MWI is designed to be scalable and replicable to other towns and cities across Canada and the world —we are currently in dialogue with Montreal (Canada), Perth (Australia) and Columbus (USA) about its applicability to other regions.

We will maintain our commitment to making progress on our challenge and outcome statements, as we have systematically aligned our Smart Mobility Program (SMP) and three major Projects to our data and technology plans, governance and evaluation, citizen engagement processes, project management and payment schedule — all carefully woven together in a performance piloting/testing and iterative investments from SMP stakeholders. This systems-based approach reduces the risk that the program strays from its original vision and is described in detail throughout the entirety of this proposal.

U-bike on electric bus at Smart Mobility Expo (October 2018)

1.3 OUR SMART MOBILITY PROGRAM

Our SMP is comprised of our three projects, designed to address Greater Victoria's mobility needs, and achieve our vision by measuring success through our five key outcome themes noted above. During the finalist phase, we have advanced design and engagement for our Projects by refining their direction and focus and solidifying the strong links and dependencies among the three projects, which are outlined below:

PROJECT 1 – INTEGRATED MOBILITY AS A SERVICE (MAAS)

Mobility as a Service (MaaS) represents an innovative shift from a personal vehicle ownership model to mobility solutions that are consumed as a service. Bringing all available modes of transportation together into a single, centralized technology platform enables this shift into a new mobility future, particularly for the user. MaaS focuses on moving people, not vehicles, and is gaining traction globally.

PROJECT 2 – SMART TRIP PLANNING AND UNIVERSAL PAYMENT PLATFORM (STP)

While Project 1 is the platform to bring people, communities, schools and employment opportunities together with a broader range of transportation options, Project 2 is the tool to make those mobility services convenient. This project is critical for improving multimodal adoption rates. This trip planner serves as the interface between the end user and the MaaS platform. It will be a seamless, universal payment system for all the region's mobility services.

PROJECT 3 – SMART SOUTH ISLAND INSPIRATION CENTRE (SSIIC)

Our vision is that the SSIIC will start initially as a digital platform to host transportation data from multiple sources and operators into a single, usable platform. This platform is essential in the development of the digital ecosystem that enables third parties to scale the delivery of MaaS and trip planning and payment applications. Our intention is for this digital platform to evolve over time into a physical, interactive mobility lab dedicated to collaboration, education, and innovation through advanced analytics and data simulation.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

1.4 BRINGING "CITIZEN-INSPIRED TRANSFORMATION" TO LIFE

SIPP's greatest strength as an organization and regional voice is its proven ability to unlock the exponential power of collaboration. Over the past two years, SIPP has become a key leader and facilitator of the smart mobility transformation in our region. Our early engagement process (leading up to our initial proposal) culminated with Vision 2040, our long-term vision to address major regional challenges across five key themes—environmental health, human health, economic resilience, transportation and mobility, and affordability. From this list, citizens, businesses, civil society groups and local leadership identified transportation and mobility as the single-most important priority to address today.

Since being selected as a finalist in Canada's Smart Cities Challenge (SCC), we have learned a lot about our fellow citizens—how mobility impacts their needs, aspirations, challenges and hopes for the future. We have now met with hundreds of citizens and stakeholders in Greater Victoria, and engaged indirectly with thousands more through surveys, campaigns and online impressions. These engagement insights, described in Chapter 2, directly informed our SMP.

1.5 CO-DESIGN TARGET GROUPS

Vision 2040 and our ongoing engagement continues to frame our approach to the projects within our SMP, which are detailed in Chapter 2. In order to test our projects, we identified three population groups facing the most pressing challenges in Greater Victoria and across the country. Our first set of co-design target groups consist of Indigenous students, seniors, and new employees. We detail these groups and profile individual users on page 13.

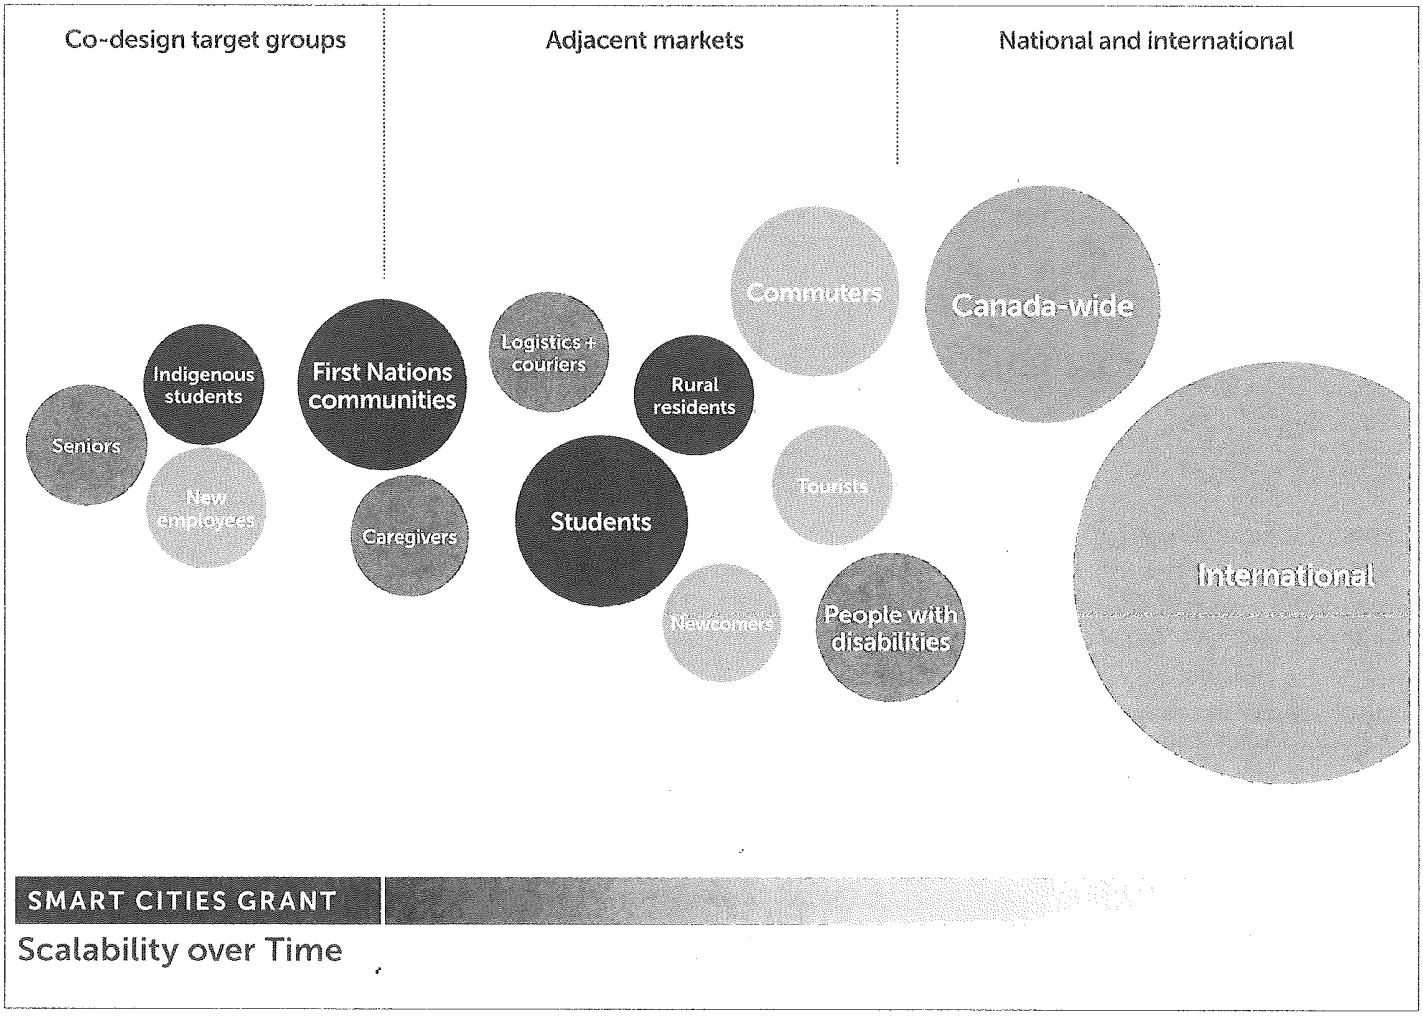

Figure 1.1: Scalability of projects

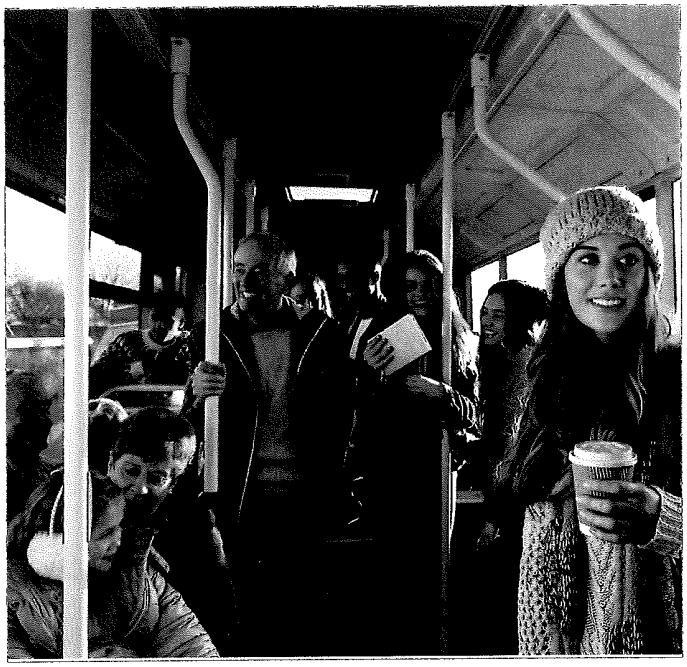
Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

These groups share similar characteristics and mobility needs with additional population sub-sets (e.g. low-income, language minorities, rural/remote, caregivers, accessibility-challenged, etc.). Insights derived from our co-design target groups are intended to help inform services, refinements and innovation that can be used to design and scale mobility solutions for new markets with similar characteristics as shown in Figure 1.1. Over time, these solutions can scale across the broader population of Greater Victoria to achieve our challenge statement and Vision 2040 goals.

The significance of the SMP spans far beyond the co-design target groups. We expect to take our learning to extend the program to other non-emergency mobility needs of the wider Greater Victoria region to improve efficiencies, availability and the range of transit services by scaling to new local markets, rural communities across the province and, more widely, across Canada.

INDIGENOUS STUDENTS



Greater Victoria is home to 10 First Nations communities, most of which have poor geographic connections to the wider community and economic centres, making it challenging to access education, services and employment. For Indigenous students, poor transit reliability and misaligned scheduling of existing transit service is a significant barrier that dramatically impacts their ability to access educational opportunities,[2] and often forces students to hitchhike or walk along hazardous roads in unsafe conditions.

SENIORS

Greater Victoria is home to the largest percentage of seniors of any large urban area in Canada, and demographic projections show that Canada's senior population will be 23–25% of our total population by 2036. In order to age in place, mobility-limited seniors need convenient, accessible and affordable transportation,[3] both to meet their daily needs and to mitigate the risk of isolation and loneliness and the accompanying mental health impacts.[4] Without change, this causes a social and economic cost to the country, approximately $390 million annually for the public cost of home care for seniors with mobility restrictions.[5] Though particularly acute in Greater Victoria, this issue is prevalent across the country.

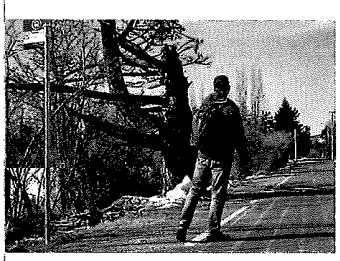
NEW EMPLOYEES

Greater Victoria's economy is strong, and there are a number of important, large employers in our region who are regularly recruiting. They want and need to attract high-quality employees, yet high housing costs and limited transportation options are often a deterrent. For newcomers, it is recognized that sustainable and affordable transportation choices are most easily established if they are part of a housing choice. This problem stretches beyond talent retention for employers and is applicable to new employees, new students and overall, new residents.

Broadening multimodal options that meet the diverse needs of Greater Victoria residents

2 According to Canada's Auditor General, the education gap for those living on reserve has widened over the last 15 years, http://www.oag-bvg.gc.ca/internet/English/parl_oag_201805_05_e_43037.html

3 According to Government of Canada over one third of Canadians ages 65 and older are living with a disability (and over 42.5% among individuals aged 75 and up), https://www.canada.ca/content/dam/nsc-cna/documents/pdf/policy-and-program-development/publications-reports/2014/Report_on_the_Social_Isolation_of_Seniors.pdf



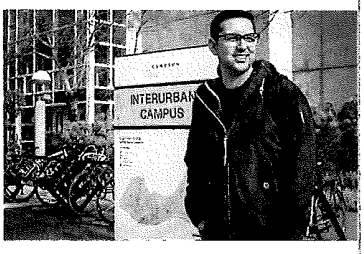
4 According to Government of Canada social isolation is a predictor of mortality from coronary heart disease/stroke to cognitive decline, https://www.canada.ca/content/dam/nsc-cna/documents/pdf/policy-and-program-development/publications-reports/2014/Report_on_the_Social_Isolation_of_Seniors.pdf

5 See Accessible Transit in Canada: Building on the Benefits. Report by the Canadian Urban Transit Association, http://cutaactu.ca/sites/default/files/cutareport_valuecaseforaccessibletransitincanada.pdf

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

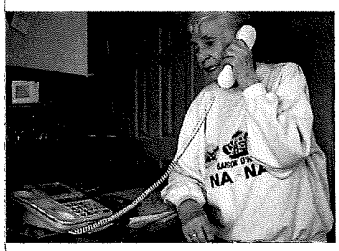
INDIGENOUS STUDENT USER JOURNEY : JARID

Jarid, aged 23, is a post-secondary student who lives on a remote First Nations reserve that is not well-served by transit. If he misses the infrequent bus he misses his class entirely, or worse, his exams. Missing classes due to poor transit access is detrimental to Jarid's education. A missed bus means being stranded for hours and lost opportunities. Having access to reliable, consistent on-demand transit is critical to Jarid's educational success and progress.



Jarid is taking transit to school for an exam. He realizes he missed the bus. The next bus arrives in an hour.

Jarid texts the Indigenous SMP text service for a backup ride to get him to school.



A First Nations community vehicle is sent to pick up Jarid for a ride to school.

Jarid arrives at school in time for his exam.

SENIOR USER JOURNEY : JACKIE

Jackie, age 91, lives alone in a condo just outside the urban core. She is blind but still very active and sharp. Living independently is important to Jackie, but she can only maintain her independence with carefully considered pre-planning. Accessible transit is critical to her quality of life and allows her to age in place—without it, Jackie would be isolated. Access to transit that serves Jackie's needs enhances her quality of life and keeps her connected to her community and family.

Jackie talks to the Smart Mobility Program help line to plan her travel for the week.

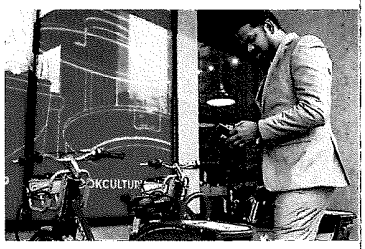
With their help, Jackie knows which bus route to take into town for her activities.

Jackie meets with her family in town at the local café for an afternoon snack and visit.

Jackie walks with her family to her medical appointment later that day.

NEW EMPLOYEE USER JOURNEY : NEIL

Neil, aged 30, is new to Greater Victoria. He recently immigrated from India and has accepted a job in the urban core. Neil doesn't have a vehicle and lives far outside the core, so he had difficulty figuring out the first/last mile of his new commute. The availability of multimodal options, like bike share, means Neil's commute is easier, convenient and affordable.



Neil has recently moved to Victoria and has been offered a new job in the city.

Neil does not own a car. He wants to know the best ways to travel and explore Victoria.

Through his new employer, Neil has access to the Smart Mobility Program app that connects him to the local bikeshare.

With the app, he can easily find, book and pay for a bike for his trips in the city.

Figure 1.2: User Journeys

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

1.6 WHY SHOULD WE WIN?

We have a head start on our challenge and engagement – A fundamental commitment to co-design and citizen engagement, and strong relationships built over time, have given us the insight, engagement and momentum to deliver results quickly. Not only have we tapped the innovation capacity of our community through open innovation challenges, we learned a tremendous amount that informs our SMP and implementation plan, enabling us to transition to a higher gear faster.

We have committed partners – We have received significant support and in-kind commitments from partners as evidenced in our partnership matrix and our 117 letters of support (Appendix 3). We have four partners categories: funding, program, funded development and research and collaborative, detailed further in Chapter 3. These partners cover a wide spectrum from engagement, citizens and civil society, to industry, and local government. We also have strong planning and implementation support from anchor partners like BC Transit and CUTA (Canadian Urban Transit Association).

We are focused on accessibility, diversity and inclusion – Our proposal engages directly with seven First Nations communities to co-design mobility options that will better serve Indigenous peoples and First Nations communities. Specifically, we will work with Indigenous students to improve accessibility that provides greater connections to educational and work opportunities, as well as improves social and economic inclusion. Our projects are designed to make impactful strides in improving convenience and accessibility for users with a wide range of mobility needs, and our co-design process will ensure a wide spectrum of voices help to shape and implement our SMP.

Indigenous Smart Mobility Pilot – Through extensive research and engagement with First Nations communities, education facilities such as Camosun College and Saanich Adult Education Centre (SAEC), BC Transit and other partners, we have been able to secure vehicle assets, drivers and training support to make the Indigenous Smart Mobility Pilot possible.

We are the ideal Canadian test market – Greater Victoria offers visibility as the Capital Region of British Columbia. We rank 15th out of 34 Census Metropolitan Areas in population and therefore are an optimal mid-size, smart city test-bed. The size of our region, and its rural and urban environments, means we will produce solutions that can be demonstrated, tested, delivered and refined to solve a variety of our region's and our country's challenges.

We are already delivering and scaling – The Mobility Wellness Index funded by the finalist grant is a collaborative tool and will soon be shared with many cities to track regional and national progress across a consistent set of indicators. This tool is now ready for use, and we have already developed strong interest from smart city peers like Montreal (Canada), Columbus (USA), and Perth (Australia) to apply the Index to their unique context.

We have the right governance – Globally, the biggest challenge to solving urban problems and delivering infrastructure and services is governance. We are guided by the belief that meaningful collaboration draws on the strengths of each partner and will deliver better outcomes than one partner can achieve on their own. As the only public-private partnership (P3) in the SCC, SIPP is uniquely positioned as an independent, trusted organization with a proven capacity and commitment to "Citizen-Inspired Transformation".

Student from SIPP s Future Innovator Challenge at University of Victoria

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

We are trusted and independent – SIPP is not beholden to one technology or technology provider. Rather we will ensure open technologies will be favoured in all procurement activities. By removing any specific vendor requirements in our architectures from the outset, we maximize the flexibility and transferability of our solutions. While we will work with leading-edge experts, we actively preserved our independence throughout the development of our proposal to ensure that our community maintains autonomy and control over program outcomes.

We have early recognition – Within a short span of time, SIPP's smart city initiatives, as well as our governance model, are becoming globally recognized. SIPP was a top-five finalist at the Smart City Expo World Congress in Barcelona in the "Governance and Finance" category, recognized out of 473 entries for best-in-class collaborative governance. For the first time, the Intelligent Community Forum (ICF) in New York listed Greater Victoria as a 2019 Smart21 City, an annual list of the world's top cities that are actively participating in the broadband economy.

We have enthusiasm and momentum on our side – Community buy-in is at an all-time high, and the necessary players are at the table for the first time. Where we recently had silos, we now have the collective belief that our shared vision will become a reality. We are ready to show Canada that Greater Victoria is a smart community!

Some collaborative partners at SIPP's Transportation and Mobility Stakeholder Roundtable

CHAPTER 1 LINKAGES TO OUTCOME THEMES

Convenience
STP makes different mobility options convenient to access

Seniors will be provided with convenient transportation needs to mitigate isolation

Affordability
Improved transit will make finding affordable housing easier to access

Students have affordable alternative transit options

Wellbeing
Better transit options improves citizens' physical, emotional and economic wellbeing measured by the MWI

Better transit services mitigate isolation among seniors

Green
MaaS focuses on moving people, not vehicles

Vision 2040 will address and monitor environmental health

Inclusivity
Better accessibility improves connection to educational and work opportunities, improves social and economic inclusion

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

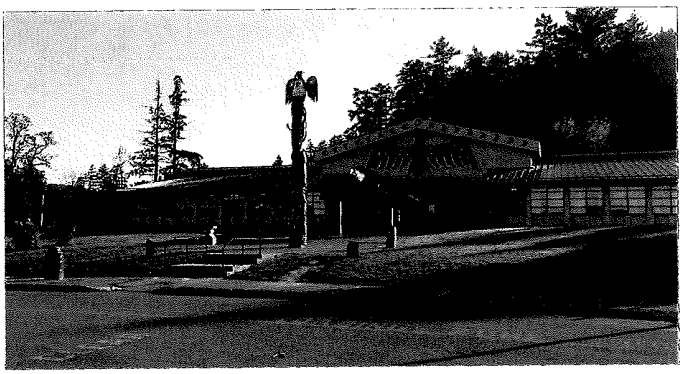
CHAPTER 2
Technology

"Sustainable solutions based on innovation can create a more resilient world only if that innovation is focused on the health and wellbeing of its inhabitants. And it is where technology and human needs intersect—that we will find meaningful innovation."

– Frans van Houten

2.1 TECHNOLOGY PLAN FOR OUR SMP

Technology will be developed and delivered through our three projects to address pressing mobility needs by engaging smart technology and our smart citizens—in tandem—to achieve our "freedom to move" vision. We will measure success through our five key outcome themes (Chapter 1).



During the finalist phase, we have advanced design and engagement for our projects—refining their direction and focus and solidifying the strong linkage and dependencies among the three projects outlined below.

These projects are vehicles for improving our citizens' wellbeing and for helping us achieve measurable progress toward our challenge statement to create a multimodal transportation network that is convenient, green, and affordable, boosting South Islanders' mobility wellbeing score by at least 20%.

2.1.1 PROJECT 1 – DELIVERY OF INTEGRATED MOBILITY AS A SERVICE

Mobility as a Service (MaaS) is central to our proposal approach and our vision for a new mobility future. MaaS represents an innovative shift from a personal vehicle ownership model to mobility solutions that are consumed as a service. Bringing all available modes of transportation together into a single, centralized technology platform enables this shift into a new mobility future, particularly for the user. MaaS focuses on moving people, not cars, and is gaining traction globally.

Our initial demonstration for this project will be the Indigenous Smart Mobility Pilot. During our engagement with First Nations communities, we have heard that challenges related to service availability, reliability, safety, cost of travel and a lack of awareness of service options are resulting in students, parents and local bands having to develop and operate their own ad-hoc mobility options.

The ŁÁU, WELṈEW Tribal School, part of the W̱SÁNEĆ School Board. All 10 First Nations in the region require reliable access to school.

The Indigenous Smart Mobility Pilot will offer flexible, on-demand microtransit service for 150-200 students across First Nations communities. It will leverage the deployment of existing community-owned or community-run vehicles in a more efficient and coordinated manner. Through several meetings with First Nations communities, we were able to assess the availability of community-owned vehicle assets and drivers, which could be engaged to achieve this MaaS pilot (see Chapter 6 for details on infrastructure readiness). We have gained significant buy-in for this concept by First Nations communities, and this level of collaboration should not be understated as it is critical to our success.

Over time, this pilot will scale to provide more flexible and on-demand mobility services within First Nations communities (for example, non-emergency medical transport services). All customer-facing elements of MaaS must look, feel and have functionality that users want and need. We will develop these through a co-design process with our three co-design target groups. These will be provided, and enforced against a common library of tools, APIs and data standards.

In developing our MaaS concept, we drew from experts who have deployed MaaS pilots in commercial settings around the world. We learned from the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Canadian Urban Transit Association (CUTA). This helped inform not only our vision, but also our engagement, co-design process and implementation plan focusing on high-needs groups. We can quickly deliver pilots that can be replicated for other geographies and groups. Through the implementation of MaaS, we can also offer insights on how to improve efficiencies and expand service options for seniors and people with disabilities (e.g. BC Transit and handyDART). We expect this MaaS approach to be flexible, on-demand mobility that will scale to new local markets, more rural communities across the province and more widely across Canada. We envision Greater Victoria as a showcase for regional MaaS and as an exporter of convenient, scalable and multimodal solutions.

2.1.2 PROJECT 2 – SMART TRIP PLANNING AND UNIVERSAL PAYMENT PLATFORM (STP)

While Project 1 is the platform to link people, communities, education and employment opportunities together through a broader range of mobility options, Project 2 is the tool to make those mobility services convenient—a critical element to improving multimodal adoption rates. Our trip planner is the critical technology interface between the end user and the MaaS platform. Project 2 will enable a user to plan, book and pay for travel through a single MaaS account. These core functions will be developed and available to all participating MaaS providers in order to establish a single, shared technology platform.

2.1.3 PROJECT 3 – SMART SOUTH ISLAND INSPIRATION CENTRE (SSIIC)

We envision that the SSIIC will serve as the region's shared digital platform for hosting transportation data from various sources and operators into a single, usable platform. This project will establish a trusted data commons to support the functionalities that will help us deliver Projects 1 and 2. This digital platform is critical for enabling third parties to scale the delivery of MaaS and trip-planning and payment applications, which will make the 'integration of services' achievable. It will also enable third parties to access or upload data from various providers by entering into data sharing agreements directly with SIPP, rather than undertaking agreements among many different parties or agencies.

The SSIIC will make transport data more open and accessible to all citizens of Greater Victoria, so that they can make better, more informed decisions related to mobility and the region. This is made possible through the development of open data mapping, visualization, analytics and simulation tools. Over time, we envision that this platform will evolve into a physical, interactive mobility lab dedicated to collaboration, education, and innovation through advanced analytics and data simulation. Entrepreneurs, researchers and others will use the SSIIC to pilot and develop their own projects, businesses and innovative pilots. The SSIIC could also be expanded to address the four other goal areas in our Vision 2040 plan in addition to improving transportation.

Trip-planning smartphone application © Arup

Figure 2.1 outlines the technology architecture and the Smart Mobility Program (SMP) framework for this project. Standardization of data and tools make it easier for new mobility providers to participate in the SMP, and enables new services to be integrated safely and efficiently. This process will also enhance the value delivered from existing mobility services, by enhancing their potential market reach and connecting them with related services. It will enable new partners to join the SMP to address remaining inefficiencies within the region's mobility network by having a clear set of shared standards and common interfaces to services. For example, new transport providers will be attracted to the region for two reasons: rider demand is aggregated across the mobility network, making it easier for new service opportunities to be identified, and a common library of standards and tools reduces time for new services to be validated.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

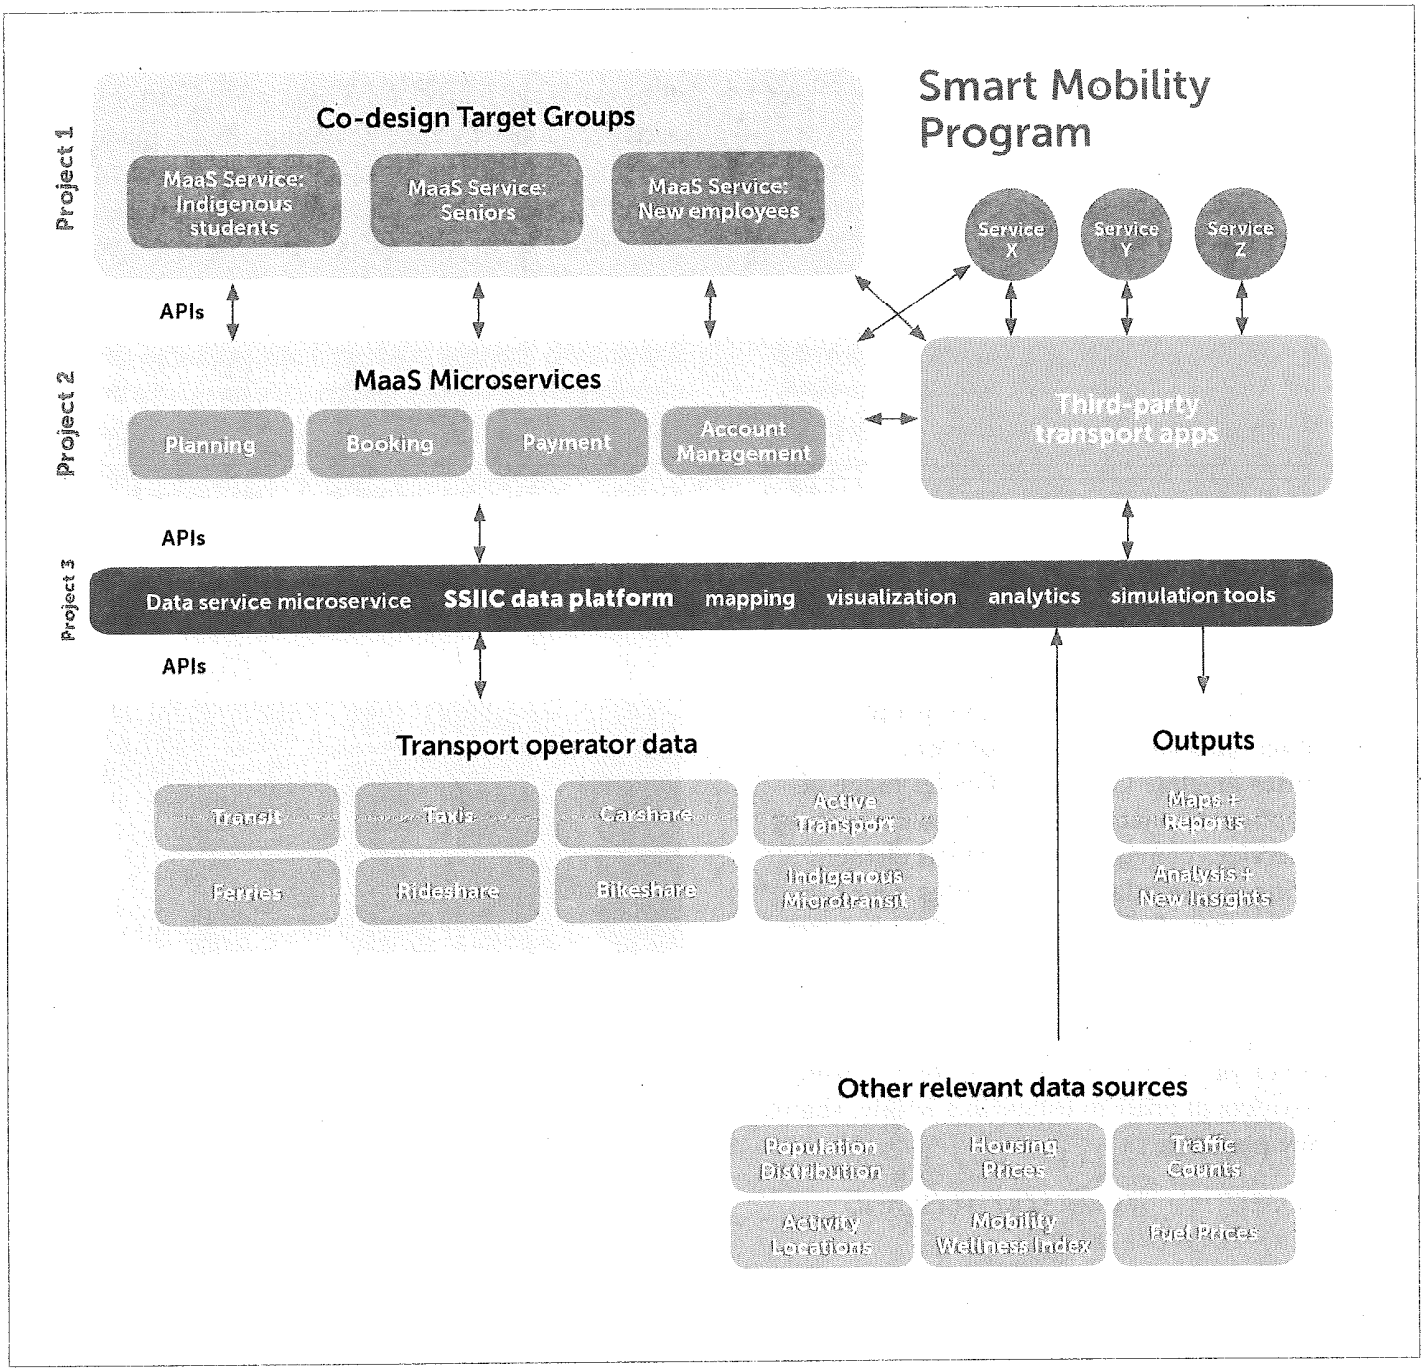


Figure 2.1: Technology architecture and Smart Mobility Program

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Technology details and applications

The MaaS platform is constructed as a framework of microservices that communicate through application programming interfaces (APIs). Developers can configure functionality to be used as part of each deployed MaaS service (see Figure 2.2). New requirements and mobility tools can be added as extensions to the core framework. Mobility tools can be identified as standalone fixed components of functionality accessible by other services.

The advantage of the microservice approach is that changes to external systems have little impact on the underlying deployed services. For example, if the planning microservice uses Google Maps as the primary supplier of directions information, and there is a decision to replace Google Maps or enhance it with another system, the impact to the underlying deployed MaaS services is minimal. This helps ensure future-proofing, so that our platform is not anchored to a single supplier.

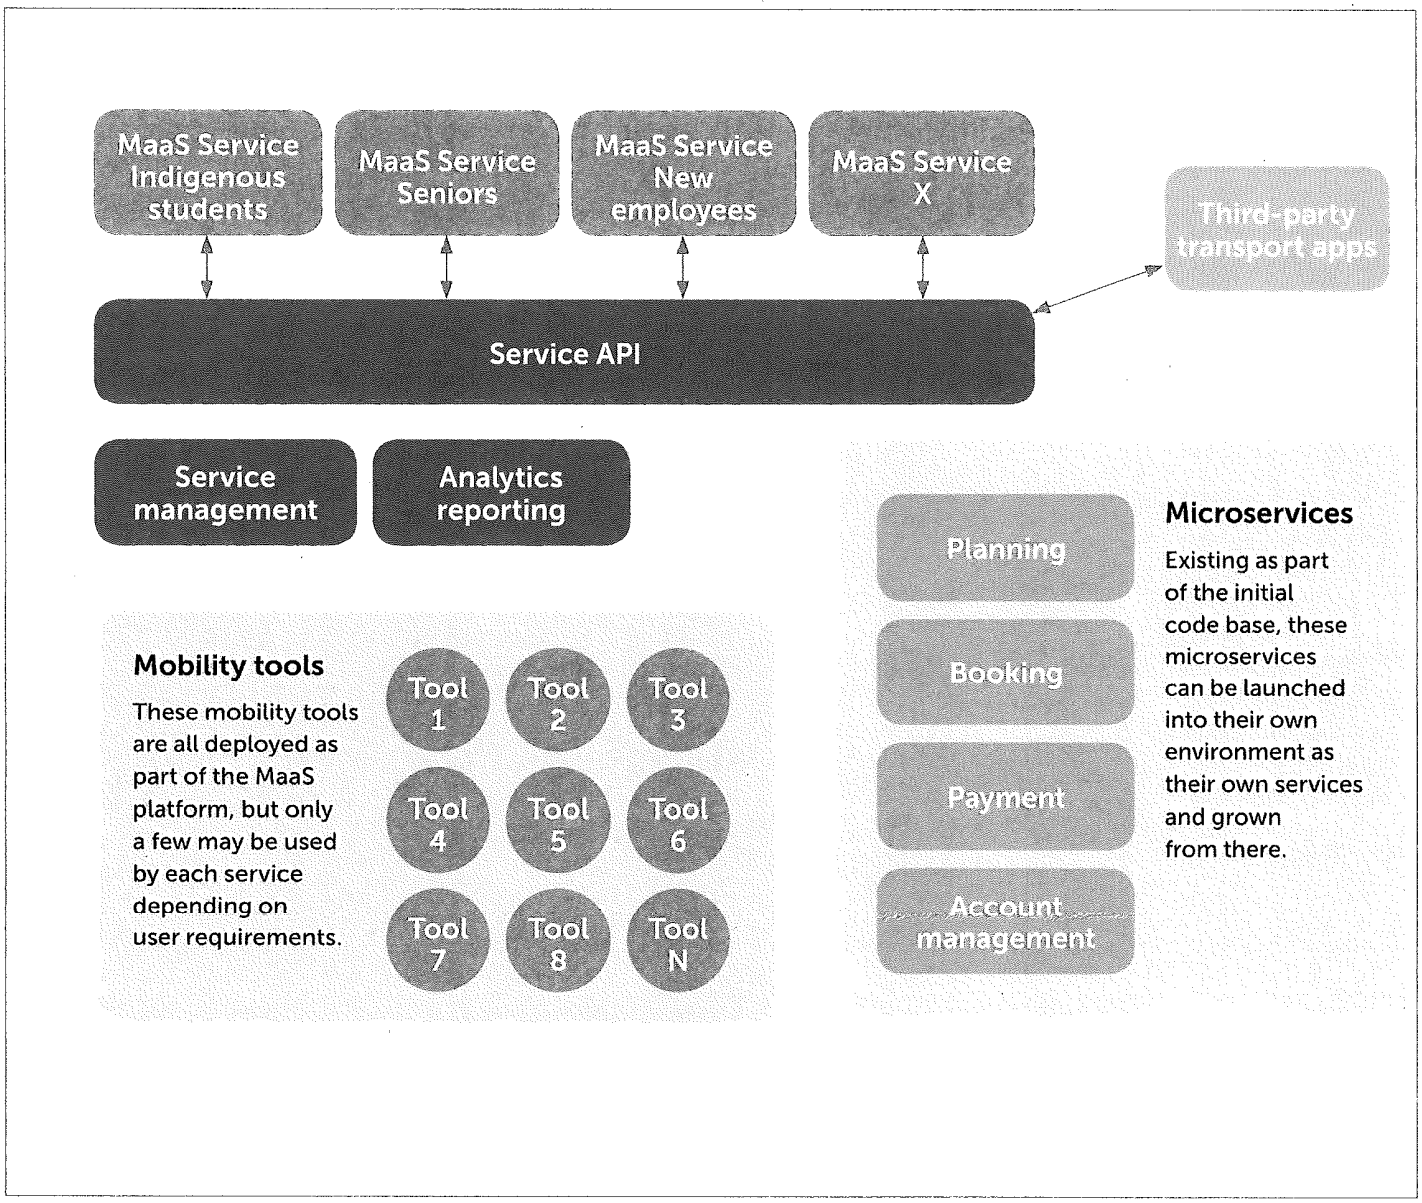

Figure 2.2: Microservice approach

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Project 1: MaaS

As outlined in our Vision (Chapter 1) we focused our MaaS pilots on three co-design groups and introduced an Agile project methodology (Chapter 6) to deliver quick wins, while enabling us to innovate as we iterate and develop the MaaS pilot.

The technology focus for Project 1 will be on the co-design process that will help determine user requirements for the MaaS service. The co-design process provides both the user requirements and customer trips from which we will build the service and adapt the MaaS platform in Project 2. These two projects will then determine the data to be delivered to Project 3, so there is a strong symbiosis between our projects, as well as shared technology and data-sharing benefits across our SMP.

Low-Tech + Low Cost = Maximum Impact

"Sometimes the smartest ideas aren't the most technological ones. If our communities can't benefit from new technologies because some people don't even have connections to WiFi in their home, then we're forgetting that our goal is people."
- Chief Ron Sam, Songhees Nation

Our community can only realize shared benefits from new technologies and mobility services if our solutions have wide-reaching positive impacts for all of our residents. Our engagement with the Beecher Bay (Sc'ianew) First Nation, provided valuable insight to the technology challenges that are faced by residents, who do not have a cell phone tower in the area, meaning data coverage is extremely limited in this location.

Careful consideration has been given to the user interface for the Indigenous Smart Mobility Pilot because data coverage in rural and First Nations communities are often limited. Through engagement with the First Nations communities, it was noted that a text-based notification approach, coupled with a web-based application would be developed in order to reach a wider audience of users.

This strategic choice enables us to not only be a smart city but to also be an inclusive city by providing smart solutions that do not require out-of-pocket costs by the users and are easily scalable to technological and financially vulnerable populations. Taking a low-tech, low-cost approach, while co-designing directly with users to address critical needs, as in this case, can often can yield maximum benefits and realize the smartest solutions.

Table 2.1: Project 1: MaaS technologies

MaaS Technologies	What does it do?	What does it achieve?
User account microservice	Allows registration and authentication of user and account set-up	Interoperability, scalability
API gateway	Provides communications to services within Project 1 and future third party in other areas	Interoperability, scalability, future-proofing, replicability, feasibility
Web app	Responsive website that can be used like an App for user to access or request the MaaS service	Interoperability, inclusivity, scalability
Mobile app	Application written for iOS/Android smartphones to access or request the MaaS service	Interoperability, scalability, future-proofing
Support functions	Functionalities to support printing of itineraries, responsive interfaces, personal phone support or webchat	Interoperability, inclusivity
Mobility tools	Specific tools developed to meet a users' requirements. Examples include a transportation cost calculator, taxi fare splitter, or a supplier dispatch tool to coordinate community vehicle supply with demand (for Indigenous MaaS Pilot).	Inclusivity, scalability, future-proofing

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

This initial technology approach ensures that we are delivering on the following outcome statements:

- Convenience – low barrier for users to access the technology required to be a part of the Indigenous Smart Mobility Pilot;
- Affordability – low or no cost to upgrade required hardware/software technology;
- Wellbeing – improving on wellbeing with access to alternative transportation options;
- Inclusivity – this approach ensures the Indigenous Smart Mobility Pilot is available to everyone within the target group, by offering a low barrier and no/low cost to access and use the service.
- Green – users will have improved awareness of walking and cycling options for their trip

In future iterations and Stage Gates, technologies will be developed and scaled to address the needs of the other co-design target groups and markets.

Table 2.2 outlines the MaaS technologies we will be utilizing, what they enable or support, and the goals and outcomes they help achieve.

Project 2: STP

The trip planner is the primary interface between the end user and the MaaS platform. The following are the key functions we will specify for the service delivery partner during the implementation phase:

- Planning: Plan trips using multiple modes of transportation
- Booking: Booking integration of mobility services that include both "on-demand" services (community buses/vehicles, handyDART, and taxis) and scheduled services (BC Transit bus services, BC Ferries)
- Payment: Payment technology that provides a seamless experience for users and enables payment distribution across mode providers. Multimodal payment technologies also provide opportunities to drive new business, partnerships and equity initiatives

Table 2.2: Project 2: Smart Trip Planner

MP2 TECHNOLOGIES	WHAT DOES IT DO?	WHAT DOES IT ACHIEVE?
Trip Planner Microservice	Connects and consolidates travel data sources with trip plan requests	Interoperability, scalability
API Gateway	Provides communications to services within MaaS and future third party in other areas	Interoperability, scalability, future-proofing
Fallback function	Microservice functionality to provide geographic coverage via third party data	Interoperability, inclusivity, scalability

Table 2.3: Project 2: Payment technology

TRIP PLANNER PAYMENT TECHNOLOGIES	WHAT DOES IT DO?	WHAT DOES IT ACHIEVE?
Payment Microservice	Provides MaaS service user functions (registration and management of funds in/out, checks, refunds and termination) required to link to third party banking service. Required for pre-paid and payment gateway payment	Interoperability, inclusivity, scalability, future-proofing, feasibility
MaaS Stored Account API	Communications service to support a pre-paid banking service	Interoperability, scalability, future-proofing, replicability
Multiple Payments API	Communications service to support a pre-paid banking service	Interoperability, scalability, future-proofing, replicability

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **Standardized Account Management**: Establish shared account management policy and processes across mode providers and network operators to ensure efficient and equitable service delivery to all populations in MaaS service zones.

As a microservice nested within the MaaS technology platform, the trip planner connects to other third party systems to respond to a user trip request coming from a central gateway controller. This is a single point for all trip-planning requests and is made available by an API for all the MaaS services and third parties.

The trip payment platform will support multiple payment types to ensure inclusivity. Use of tokens and digital wallets will be used for both real-time and recurring payments as we move closer toward a cashless society. Payment friction can be minimized improving the user experience while also reducing payment bottlenecks. The platform would also link transport operators to various financial networks to ensure proper payment authorization, settlement and reporting.

Project 3: SSIIC

SSIIC will initially be a digital platform and clearinghouse, integrating a wide range of data from multiple third-party sources including transport operators, municipal governments, and other data providers (detailed in Section 5.2). It will be hosted on a secure cloud-based platform that contains microservices and tools to request, visualize, and analyze mobility data. Data are owned and stored by third parties and would be accessible to the SSIIC by APIs. This hosted service will reside in Canada.

The integration of data within the SSIIC addresses two primary use cases:

- For a MaaS transport app developer, the SSIIC will integrate data to enable the development of universal trip planning and trip payment (e.g. Projects 1 and 2).

- For residents, planners, and decision-makers in Greater Victoria, the SSIIC will integrate data to visualize, analyze, and simulate how mobility is affecting key outcomes.

Over time, the SSIIC intends to evolve into a physical common space, enabling citizens to engage and collaborate on transport and mobility challenges in Greater Victoria. This might include the following:

- Public engagement sessions on transport, urban issues, smart city solutions

- Hackathons on transport and urban issues

- User training and support related to MaaS, data and privacy education

Table 2.4 outlines the technologies and functions related to Project 3. These technologies will be selected from best-in-class providers, developed through SIPP partnerships, or developed through open procurement processes. Open-sourced solutions will always be given priority in keeping with the vision and philosophy of our SSIIC and our governance model.

Table 2.4: Project 3: SSIIC technologies

SSIIC Technologies	What does it do?	What does it achieve?
Data Source Microservices	Connects data requests from MaaS, trip planner, and visualization/analysis (SSIIC) microservices to third-party data provider APIs.	Interoperability, scalability, future-proofing
Mapping and Visualization Tools	Displays transportation network and spatial data as layers on an interactive map, with corresponding charts and graphs	Interoperability, scalability, future-proofing
Analytics Tools	Calculates data from multiple sources to enable analysis of mobility and outcomes	Interoperability, scalability, future-proofing
Simulation Tools	Enables user input of transportation network and spatial data attributes to test the change in outcomes and test "what if" scenarios	Interoperability, scalability, future-proofing
API Gateway	Provides communications for MaaS and third-party developers to connect to the Data Source Microservices	Interoperability, scalability, future-proofing
Open Data Portal Web Application	Provides public access to open data sources and mapping, visualization, analytics, and simulation tools	Interoperability, inclusivity, scalability, future-proofing

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

2.2 FUTURE-PROOFING AND SCALABILITY

Future-proofing and scalability are essential to our Smart Mobility Program. These attributes have been integrated into our project's architecture and technical design, the development processes to design the services, supporting partnerships, and open technology standards. Specific elements are detailed in the following sections.

2.2.1 TECHNICAL DESIGN

Microservices Approach with open APIs

This approach has been specifically chosen to support re-use. This approach also enables third parties to access and adopt these services.

Hosting

For our web application model we intend to separate the architecture into presentation, application and persistence layers. This architecture has been designed to scale out by adding additional hosts at the persistence, web or application layers and has built-in performance, failover and availability features. Using a cloud-based hosting model makes it easy to set up, operate, and scale.

Fallback Functionality

This functionality allows usage of basic features in the trip planner to be utilized outside Greater Victoria. This enables potential adopters (municipalities, customers) to have some initial interactions in a live environment.

2.2.2 TECHNICAL PROCESS

Co-design process

The co-design process that guides our projects ensures that the MaaS services, the microservices and mobility tools are intimate to user needs. After co-design, the draft functionalities will be prioritized (by users) by their impact on behaviour and attractiveness to users/new users. This supports widespread adoption by users.

Local innovation challenges

SIPP has a proud record of hosting successful "hackathon"-style innovation challenges (Chapter 4). These have produced highly innovative products and services. This open call for solutions, married with the open platform upon which solutions can be built, provides an incubator and infrastructure that support innovation. These events will continue to have an impact by way of innovators participation, and project visibility and scalability.

2.2.3 TECHNICAL PARTNERSHIP

SSIIC digital platform

The SSIIC will host a centralized library of products (microservices, API Gateways, Mobility Tools and APIs) and business rules (technical, organizational and commercial arrangements to deliver the services). These will be made available to municipalities and other stakeholders in order to increase adoption and reduce development costs.

Scaling across Canada

We have partnered with BC Transit and CUTA to assist with the dissemination and scalability across British Columbia and Canada, notably in creating a Co-Design Toolkit and MaaS guidelines, as well as aligning specific dissemination activities with their wider ongoing networking and technical development outreach.

2.2.4 OPEN STANDARDS

We are committed to a non-proprietary, multi-vendor architecture and procurement. Wherever possible, we will defer to open systems to support transferability of solutions, reduce single points of failure in the design, and enhance innovation wherever possible in the architecture. Open standards allow for rapid and sometimes disruptive innovation to occur throughout the value stack, and truly enable citizen inspired and engaged innovation.

Open Innovation Challenge winner, Simon Park, with his prototype of Caboost, an electric bike assist that can be attached to regular bicycles

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

2.3 COMPLIANCE AND STANDARDS

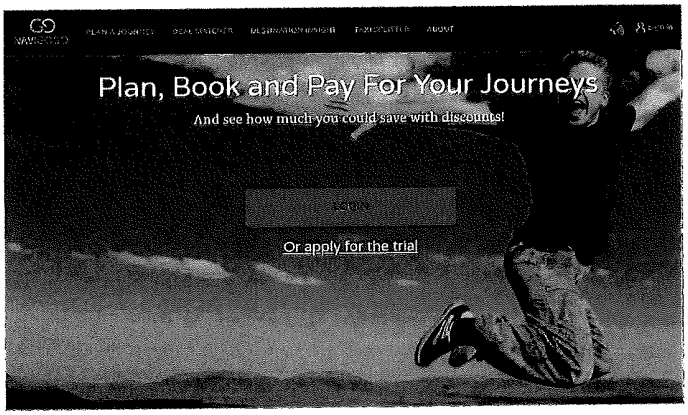

Table 2.5 shows relevant compliance areas and conformity to standards.

Table 2.5: Compliance and standards

Compliance Area	Standards Conformity
Personal privacy/digital rights	PIPA (BC)
Legislation/directives governing financial prudence and exclusions	Fintrac (Financial Transactions and Reports Analysis Centre of Canada) regulations regarding KYC, AML, MSB
Interoperability of ticketing within and between modes	EMV contactless payment standard P2P Tokenization for Card on File transactions
Security in financial transactions featuring credit cards	Payment Card Industry Data Security Standard (PCI DSS) SOC1/SOC2 NIST/ISO security frameworks

2.4 TECHNOLOGY PARTNERS

SIPP will work with its well-developed network of technology partners to deliver the technical solution and integrate component parts. Our diverse partnerships offer SIPP the help and capabilities needed to successfully build out MaaS. These capabilities include: scheduled display, real time display, trip planning, pricing, payment, ticketing, and integrated multimodal route optimization. SIPP has engaged a wide range of technology partners and has received numerous statements of support and interest as evidence of their commitments to supporting our SMP. These statements of support and interest can be reviewed in Appendix 3.

NaviGoGo is a MaaS application designed by young people. © NaviGoGo

2.5 INCLUSIVITY AND ACCESSIBILITY

It is imperative that the advances made through our projects are inclusive, accessible and have benefits for all people. Where digital technologies are a focus, individuals can be excluded because of: (a) poor awareness/promotion of new solutions; (b) lack of access to smartphones, computers or internet; (c) poor data connectivity; (d) poor interfaces or usability. We will promote inclusivity through:

- Considerations of service deployment – e.g. use of free SMS text messaging or helplines alongside digital options (e.g. website or app);
- Ensuring the ability to use digital services offline (e.g. allow users the ability to use WiFi to plan trip but save trip plan for offline use);
- Collaboration and co-design with users to design and test appropriate interfaces and easy usability;
- Using a range of interface and communications options to be fully responsive to users with a range of disabilities;
- Creation of video content, case studies and real-life examples on what to expect when using accessibility features available for modes of transport;
- Trip planner can be designed to provide user profile selections that offer meaningful accessibility information to users, integration of in-transit accessibility information such as walking distances or walk scores, curb ramp availability or sidewalk conditions;
- Call-in services are maintained (see User Journeys page 13).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

2.6 RISK MITIGATION

Table 2.6: Risk mitigation strategies

RISK	MITIGATION STRATEGIES
Technological components are not suited to task	All major system elements will be evaluated for (at least): scalability, interoperability, standards compliance, secure design and extensibility. Our open architecture and capacity to plug and play means we are not tied to any one supplier solution and can adapt and transition services as technology evolves. In our procurement strategy we will include an assessment of vendors' capability to deliver.
Change management practices incomplete	Through our PMO, we will ensure all changes are validated. Changes will be signed off and escalated if they impact form, fit or function.
Architecture is not fit for purpose	Formal architecture design is an integral part of the overall co-design method. Architectural designs will be signed off by steering committee and technology taskforce prior to development.
Lack of inclusivity (digital divide)	Our co-design process will include consideration of potential inclusivity issues related to co-design target groups. As noted earlier, a key issue relating to payment are those people who are unbanked or with reduced banking trust, and solutions such as pre-paid accounts will be explored.

CHAPTER 2 LINKAGES TO OUTCOME THEMES

Convenience
Greater Victoria serves as a showcase for MaaS and scales convenient solutions

Low cost and technology barriers pertaining to the Indigenous Smart Mobility pilot

Affordability
Low or no cost to upgrade hardware/ software technology required

Wellbeing
Improving wellbeing with access to alternative transportation options

Green
Greater access to shared and active modes reduces carbon emissions

Inclusivity
Indigenous Smart Mobility Pilot is available to everyone within the target group by offering a low barrier and affordable access to the service

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 3
Governance

"We were impressed by the broad range of organizations that were actively engaged and the level of involvement of all parties. The effort put in by SIPP in ensuring all stakeholders are fully vested in this project, and that the public good is kept front and centre, is second to none."

– David Oliver, Co-founder and CEO, Greenlines Technology, Inc.

3.1 INTRODUCTION

Poor governance hampers the effective delivery of infrastructure and services. This issue is compounded in the context of smart mobility, as across the world we are seeing an influx of private operators into what had previously been "public" mass transit. Metrolinx, the regional transportation authority in the Toronto region, identified this issue in its report on New Mobility,[1] emphasizing the urgency of creating new skill sets, processes and partnerships with more flexible and responsive procurement processes to encourage private-sector innovation.

SIPP is different. Founded in 2016, we promote sustainable economic development in the interests of our membership, which includes 10 municipal governments, seven First Nations, three post-secondary institutions, seven industry associations and nonprofits, as well as 24 large employers.

We are a public-private partnership (P3) guided by the belief that combining the strengths of each partner will deliver the best outcomes and that our collective action and investment is greater than the sum of its parts. While P3s are strongly associated with infrastructure delivery and risk transfer, SIPP's is similarly positioned to draw on the strengths of each partner to deliver better SMP and project outcomes than if any one party were to operate on its own (also placing risk in the ownership of the partner best suited to manage it).

SIPP has a similar structure and mandate to the Columbus Partnership, the organization behind the winning proposal of the 2016 USA Smart City Challenge. Like Columbus, our collaborative model builds and aligns partnerships with key implementation partners that have similar interests and needs, such as mobility service providers, education and research institutes, technology providers, data specialists, municipal governments and First Nations communities, among others. These strategic partnerships are key to delivering a project this complex and to maximizing the likelihood of successful implementation locally and scalability to other regions of Canada.

3.2 GOVERNANCE FRAMEWORK

Our collaborative governance model allows SIPP to fast track implementation across the region. We can deliver quick wins at each stage of development, thus reducing project delivery time and costs. SIPP was structured by its funders to offer many notable advantages:

- Lean, efficient organization offers value for money
- Vigorous partnership network drives development, coordination and project management
- Diverse membership increases stakeholder buy-in and promotes transparency
- Singular operational focus creates clear priorities and effective processes
- Efficient operational structure can scale during project implementation

3.2.1 SIPP GOVERNANCE

SIPP's Board of Directors includes business leaders, First Nations leaders and academics, as well as legal and accounting experts. Our board operates within a well-defined policy governance mandate using rigorous standards derived from the Carver model, defining roles and relationships in four key areas: governance process (governance style and board responsibilities), strategic objectives (planning, monitoring and evaluation functions), executive

1 New Mobility. Metrolinx, 2016. Technical Paper 4 to support the Discussion Paper for the Next Regional Transportation Plan, http://www.metrolinx.com/en/regionalplanning/rtp/technical/04_New_Mobility_Report_EN.pdf.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

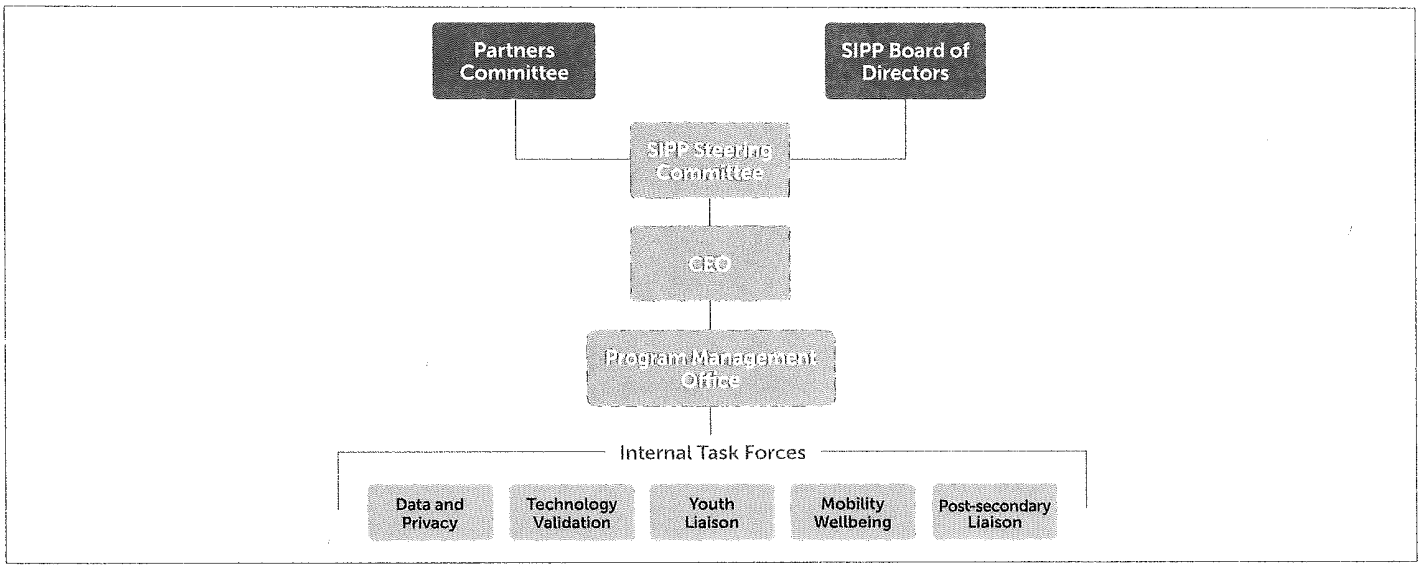

Figure 3.1: SMP governance and organization

limitations (checks on CEO powers including financial planning, asset protection, compensation, staff treatment, and more) and board-management delegation (nature of relationship between Board and CEO including delegation, monitoring and reporting). A finance, accounting and risk management committee supports this critical governance function.

SIPP's Board of Directors is accountable to our membership. The members form a Funder Council that approves bylaws, receives annual audited statements and performance reporting and elects Board members according to a competency-based board recruitment, nomination and election policy. There is a clear delineation between the roles and responsibilities of the Funder Council, the Board of Directors and Operations (led by a CEO) in order to promote effective accountability, transparency and mission focus.

3.2.2 SMART MOBILITY PROGRAM GOVERNANCE

Figure 3.1 details the governance structure for the SMP. Since 2017, SIPP has had a Smart Cities Steering Committee, which meets biweekly and is comprised of Board members and key implementation partners. The Steering Committee is comprised of the Mayor of Victoria (and Chair of the Partners Committee), the CEO of BC Transit, a Councillor from Esquimalt (and representative-at-large of the Partners Committee), the Executive Director of Songhees Nation and SIPP Board members and CEO.

A strategic advisory committee called the Partners Committee, which meets bimonthly, represents 11 local and First Nations governments and community leaders. The Partners Committee provides critical linkages to government and community stakeholders and establishes key program criteria, such as the challenge statement, outcomes statements and Vision 2040. In addition, SIPP has specialized subcommittees and taskforces to ensure the SMP aligns to agreed-upon outcomes and local priorities.

The Steering Committee has primary accountability for managing the day-to-day implementation and integration of the three SMP projects and will be supported by the Program Management Office (PMO), with staff and contractors managed by the CEO, along with associated taskforces.

The PMO will provide oversight across all three projects comprising the SMP and will align the delivery with Steering Committee direction. It will facilitate the sharing of resources, planning and information to manage dependencies between the projects. It will also help coordinate the three SMP projects, while setting standards for how each project should be delivered. The PMO will liaise the program management function with staff leads for data management, community engagement, partnerships and technology.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Financial Oversight

SIPP has the financial enterprise systems in place for an effective compliance environment, which will apply to the delivery of the SMP as well. Specifically, role-based permissions and approval limits are predefined and tailored based on stakeholders' intimate knowledge. Funds will be managed, tracked and governed using fund accounting in the financial enterprise system, and the PMO will be supported by a certified financial controller and legal counsel.

Sound financial internal controls are in place, including segregation of duties, approval limits, third-party validation, quality assurance practices and internal audits. In addition, other financial practices include retention of a part-time CFO, a certified accounting and bookkeeping firm, and an active Financial, Audit and Risk Management Committee. This allows SIPP to be flexible, manage financial and governance risks and comply with government financial reporting requirements.

On a monthly basis, the financial statements, which comprise the statement of financial position, statement of operations, changes in net assets, and statement of cash flows, will be prepared in accordance with the Canadian accounting standards for NFP organizations. The financial statements are approved by the Financial, Audit and Risk Management Committee on a quarterly basis and subsequently by SIPP's Board of Directors. On an annual basis, the financial statements will be audited by a member-appointed external auditor (historically KPMG).

Taskforces

Our taskforces help SIPP access the knowledge, local, national and international networks, and expertise of diverse stakeholders and subject matter experts. Applying these lenses allow program ideas to scale and find multiple applications for tools and technologies.

- **Data and Privacy** is co-chaired by the Chief Information Officer (CIO) and Chief Technology Officer (CTO) from the City of Victoria and includes the CIOs/CTOs of 10 other municipalities. It is responsible for considering data availability, data accessibility, data sharing, data security and data privacy, as well as making recommendations for inter-municipal cooperation.

- **Technology Validation** provides technology guidance with a focus on user requirements. It provides input on the technical feasibility to design, deploy and maintain the proposed projects, the long-term viability and scalability of proposed solutions and performs technical validation with local and global experts.

- **Youth Liaison** provides an ad-hoc organization to explore youth engagement in the SMP. It will research barriers to multimodal transportation that young people experience and make recommendations on ideal engagement techniques.

- **Mobility Wellness** oversees the regional MWI throughout the project as outcomes are monitored. It will guide refinement of future iterations and provide advice on how to scale the index to other cities in Canada and beyond.

- **Post-Secondary Taskforce** provides coordination with the University of Victoria, Royal Roads University, and Camosun College in the development and implementation of the SMP.

3.2.3 SIPP PARTNERSHIPS

Our proposal is built on firmly established partnerships and collaboration, and we draw on expertise and resources from a broad array of industry experts, political leadership and national and international smart city peers. Many of these partners have collaborated with us already in the development of the SMP. This proposal is a testament to our effort to collaborate with our partners who have contributed their expertise throughout this application. With our aligned priorities and investments, the impact the Smart City grant will have on our community, and across Canada, will be amplified many times over.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

SIPP's partnership model demonstrates exceptional community support and alignment. We have four partner categories: funding, program, funded development and research, and collaborative. Not only do these partners reduce risks associated with lack of buy-in down the road, they also represent key implementation partners. If awarded the grant, this will allow SIPP to immediately mobilize, implement and scale program delivery. Our partnership model also provides the opportunity for collective advocacy in key areas of the economy and mobility.

SIPP has phenomenal community and stakeholder support in Greater Victoria, BC, Canada and the world (see 117 letters of support in Appendix 3). In addition, SIPP has established strategic memoranda of understanding (MOUs) to foster enhanced collaboration with three key partners: Shanghai's Centre for Smart City Promotion (China), Camosun College and currently under development with the city of Columbus, Ohio (USA).

(See full partners list in Appendix 4 and summarized in Figure 3.2.)

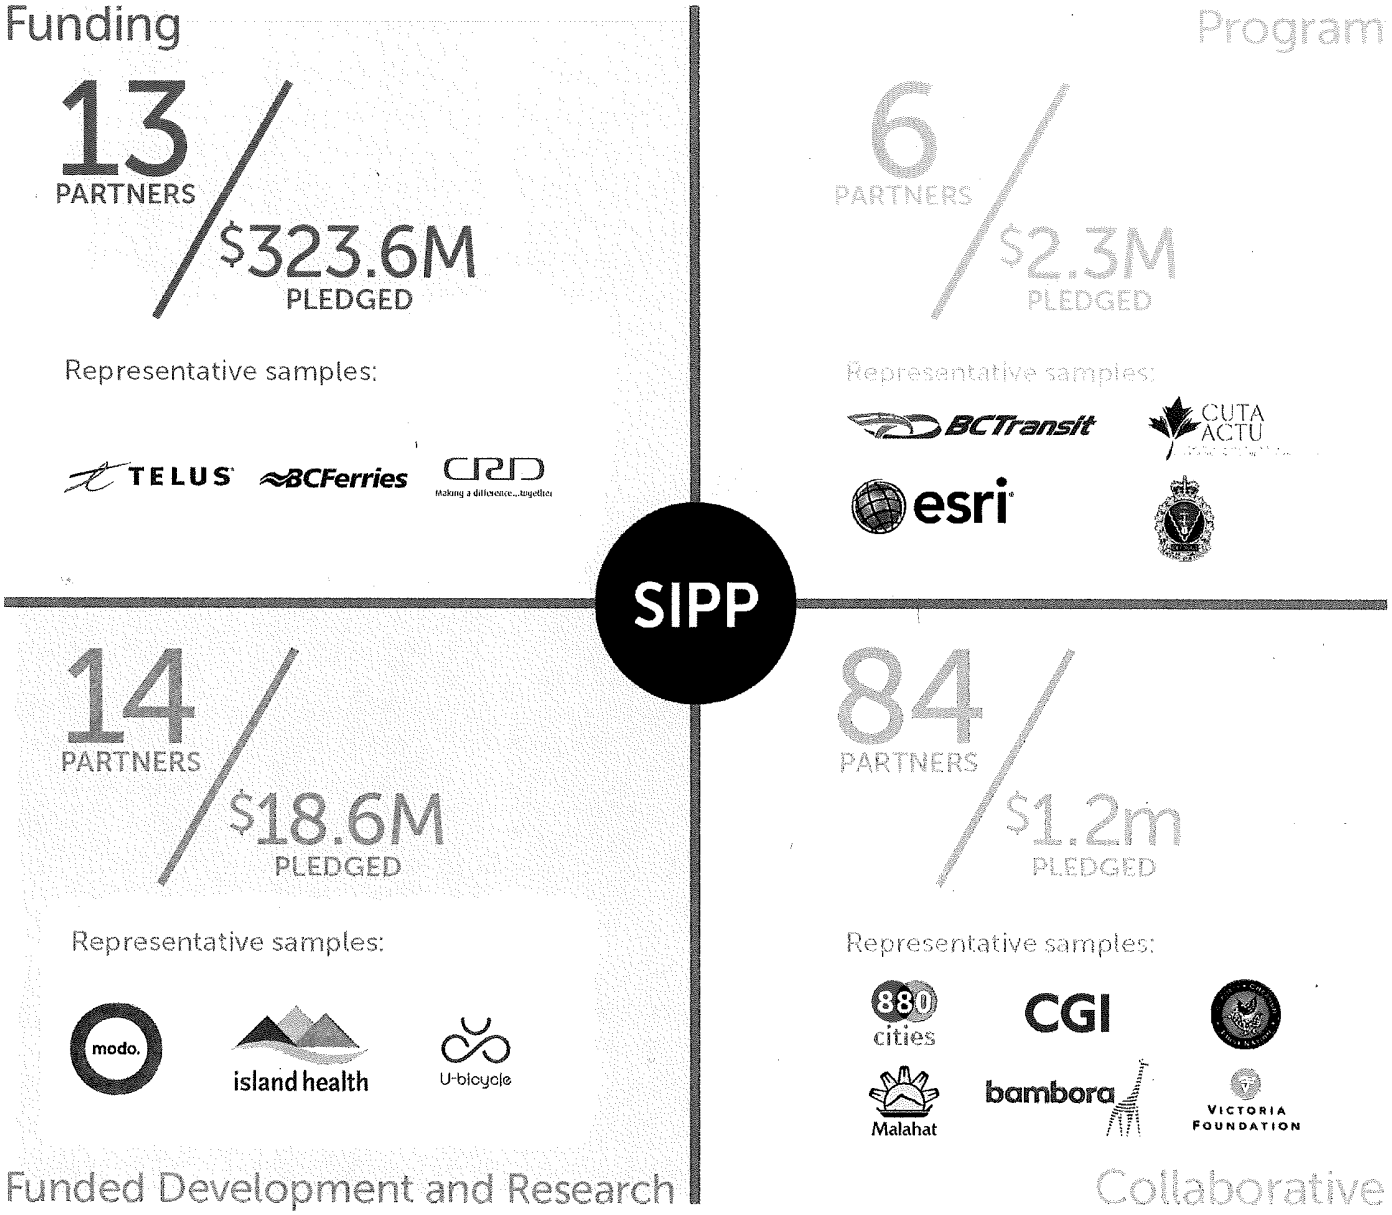

Figure 3.2: Implementation partners matrix

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Representatives of SIPP and Camosun College after signing the Indigenous Smart Mobility Pilot MOU

Key contributors to the projects include:

Funding Partners: Supporting capital, infrastructure (hard and digital) and operational initiatives that leverage and support the $10 million grant

Our **10 municipal partners** have listed aligned funding contributions in the form of capital and operational initiatives such as hard and digital infrastructure investments, planning, assets and alignment and collaboration across smart transportation initiatives. Private-sector investments in digital infrastructure like **Telus** will also help to achieve the project outcomes by providing a landscape for fast connectivity, data sharing and Internet of Things (IoT) solutions.

Program Partners: Direct contributions of in-kind materials, assets or staff time to advance our initiatives

BC Transit sees SMP as well-aligned with its corporate strategy to reimagine how it manages and operates services across the province. It has been engaged from the outset in the design of the projects and expects to provide key planning expertise, data and other in-kind contributions. The CEO of BC Transit sits on the Steering Committee.

The **Canadian Urban Transit Association (CUTA)** has contributed to the development of SMP and will be a key partner in implementation, significantly multiplying the impact and scale of project funding. CUTA's role is to represent the voice of the industry, to champion open systems, align their own ongoing research and development and, most importantly, ensure scalability across Canada.

The private sector is also coming to the table, including in-kind contributions from **Esri**, **Arup** and **ESP Group** to bring forward and accelerate the program implementation. If awarded the grant, this category will significantly increase with the addition of technology partners. Until now, we have remained strictly independent to ensure we adhere to open technology and data standards and to maintain community control over SMP governance and SMP design (Chapter 6).

Funded Development and Research Partners: Commitment to aligned research and/or funded development that can be applied to advance the SMP

University of Victoria, Royal Roads University and **Camosun College** are key partners, as they have committed to aligned research and development activities in research fields, such as Indigenous transportation networks, mobility wellness, climate change, autonomous vehicles and future transportation modes (Appendix 4).

Privacy Dynamics Inc. will provide data privacy experts, in conjunction with **Harvard University**, to develop a Private Data Sharing Interface prototype, which will allow scientific researchers to perform exploratory data analysis of sensitive human subject data. Privacy Dynamics will provide the hosting and operational support guidance on technology selection and development. The Harvard team brings together research expertise in differential privacy, geospatial data science and standards development.

Collaborative Partners: Aligned outcomes, policy and activities objectives

A substantive number of collaborative partners have also pledged their support for the SMP and have policy and programs that would benefit by its successful delivery. This list of over 80 partners includes but is not limited to governments, civil society and community groups, mobility providers, thought leaders and digital service providers, as well as international and national smart cities peers (Appendix 4).

We wish to gratefully acknowledge our collaborators and supporters for their collective contributions and their enthusiastic support of its goals.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

3.3 LOOKING TO THE FUTURE

The diversity of our partnership team makes us resilient, as we will never be reliant on any single partner. It has also been built with the future in mind as an ongoing legacy for the region. The governance and structures we have put in place will carry on beyond the life of the project. The PMO will serve as the foundation for the SSIIC, bringing in people and capacity to support smart mobility over the long term. We see our P3 as a model for other cities and regions, and our learnings will form part of our collaboration with our region and plans for dissemination and scalability.

3.4 RISK MITIGATION

Table 3.1: Risk mitigation strategies

RISK	MITIGATION STRATEGIES
Loss of community control over program outcomes and objectives Loss of community influence over planning, system design and delivery	Community engagement and aligned partnerships are central to our mandate, our P3 governance structure and our commitment to collaboration, openness and ethical practices. Based on insights from Columbus Partnership and others, we created a vendor engagement strategy to ensure we have the most flexible procurement and partnership models that do not tie us to any specific proprietary services or cookie-cutter smart city products, concurrent with the open co-design process we undertake with communities.
Continued buy-in and alignment with partners Loss of partner commitment to funding contribution Partner capacity to deliver Partner readiness and alignment to project timescales	We have a strong track record of engagement and alignment with partners established over several years and will carry that success and learnings forward into our implementation. Our governance model is being strengthened over time as more and more stakeholders perceive the value and trust in SIPP's commitment to public good. This growth has led to partnership diversity, one of our key strengths, which means we are not reliant on a single or small group of partners. Where the capacity of one partner may be weak, the excess capacity of other partners will address the gap, allowing implementation to proceed with minimal risk. From our years of working with our partners, we have a strong understanding of their engagement level, capacity and readiness and have framed our projects, project delivery structure and timelines to align with these learnings.
Changes to the political environment	With the recent municipal elections, we have fully engaged with the new councils, and have continued building our relationships with Chiefs and Councillors from local First Nations partners. Our proposal has gone before the Partners Committee and the project will be largely complete and transitioning to ongoing operations before the next election in 2022.
Emerging BC ride-hailing legislation (*Passenger Transportation Amendment Act*)	The province is currently consulting on ride hailing and expects to introduce new legislation this year. We have advised on this consultation and will monitor the legislation as it advances. A key benefit of our approach is that it does not rely on any one form of transportation; rather, it flexibly incorporates existing transit operators and emerging or changing modes as they arise in the marketplace. This mitigates any unforeseen variables within provincial legislation.

CHAPTER 3 LINKAGES TO OUTCOME THEMES

Convenience

Collaborative transportation partners agree to share data, improving the convenience and ease of access to different transportation modes for the end user

Affordability

Operational structure can scale during implementation

Partnerships provide aligned funding for lower user costs

Wellbeing

Mobility Wellness Taskforce oversees the MWI through the projects to monitor outcomes and provide advice on scalability

Inclusivity

Diverse membership increases stakeholder participation and promotes transparency

Vigorous partnership network drives development, coordination and project management

Youth Liaison Taskforce provides an opportunity for youth engagement

Close collaboration with civil societies, NFPs

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

CHAPTER 4
Engagement

"The open innovation challenges allowed us to think about how we source new ideas and innovation for our business operations differently. After the Future Innovator Challenge, we were so impressed by a team of students that we invited them to discuss their concept for an app called Bus Bank with the BC Transit team."

– Erinn Pinkerton, CEO BC Transit & SCC Steering Committee

4.1 INTRODUCTION

SIPP's most significant strength, as an organization and a regional voice, is in accessing the exponential power of partnerships and collaboration. Over the past two years, SIPP has become a central facilitator of Smart Mobility transformation and a leading cohesive voice in our region. This chapter outlines the progress of SIPP's engagement activities, as well as how lessons learned and relationships built through those activities have framed our proposal and will guide our continued engagement during implementation.

Our capacity and depth as an organization enables us to meaningfully engage citizens and stakeholders, address a wide spectrum of regional issues, provide thoughtful leadership and facilitate knowledge sharing to proactively address the most pressing issues for Greater Victoria. We boast a unique strength in the "people power" behind our engagement capacity—our diverse and dedicated staff, leaders, taskforces, stakeholders and peer cities (Chapters 3 and 6) will guide and support our engagement activities during implementation.

4.2 SIPP ENGAGEMENT APPROACH

Over the past two years, SIPP has brought its adage "Citizen-Inspired Transformation" to life, by demonstrating our passion and commitment to co-creation, inclusive governance and citizen-focused engagement.

To date, we have used an engagement framework developed by the International Association of Public Participation (IAP2), which is comprised of five progressive engagement levels outlined below. We have put this approach into practice through all of SIPP's engagement activities, ranging from broad public forums and general awareness building, to in-depth surveys and one-on-one dialogues.

Engagement level

Inform	To provide balanced and objective information in a timely manner
Consult	To obtain feedback on analysis, issues, alternatives and decisions
Involve	To work with the public to make sure that concerns and aspirations are considered and understood
Collaborate	To partner with the public in each aspect of the decision making
Empower	To place final decision-making in the hands of the public

International Association of Public Participation engagement levels

We have applied this approach with stakeholders at many levels, consulting with mayors, First Nations leaders and CEOs to often-overlooked groups such as students, who we empowered through a Youth Liaison Taskforce. We consult and collaborate to be as inclusive as possible, hosting roundtables with the Disability Resource Centre and at Camosun College with Indigenous students. We inform new residents about our projects at the Intercultural Association, a local immigrant and refugee centre. Our shared vision and our solutions are stronger when we engage together.

Camosun students at pop-up poll

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

4.3 ENGAGEMENT TO DATE

Figure 4.1 details SIPP's engagement to date, highlighting the IAP2 levels of engagement associated with these activities. This is followed, on the next page, by detailed descriptions of our activities and the insights that illustrate our capacity and committed track record to "Citizen-Inspired Transformation" and focused engagement that will drive our implementation plan.

Engagement statistics at a glance

#freedomtomove Campaign:

- Social media impressions – **355,600**
- TV / Radio impressions – **948,100**
- Website hits – **12,600**

Other engagement:

- Public attendance at events – **1,450**
- One-on-one engagements at Pop-up Stations – **300+**
- In-depth survey completions – **562**
- Number of posters throughout the city – **1,750**
- Smart Mobility Manifesto signatures to date – **914**
- Proposals received for Innovation Challenges – **140+**

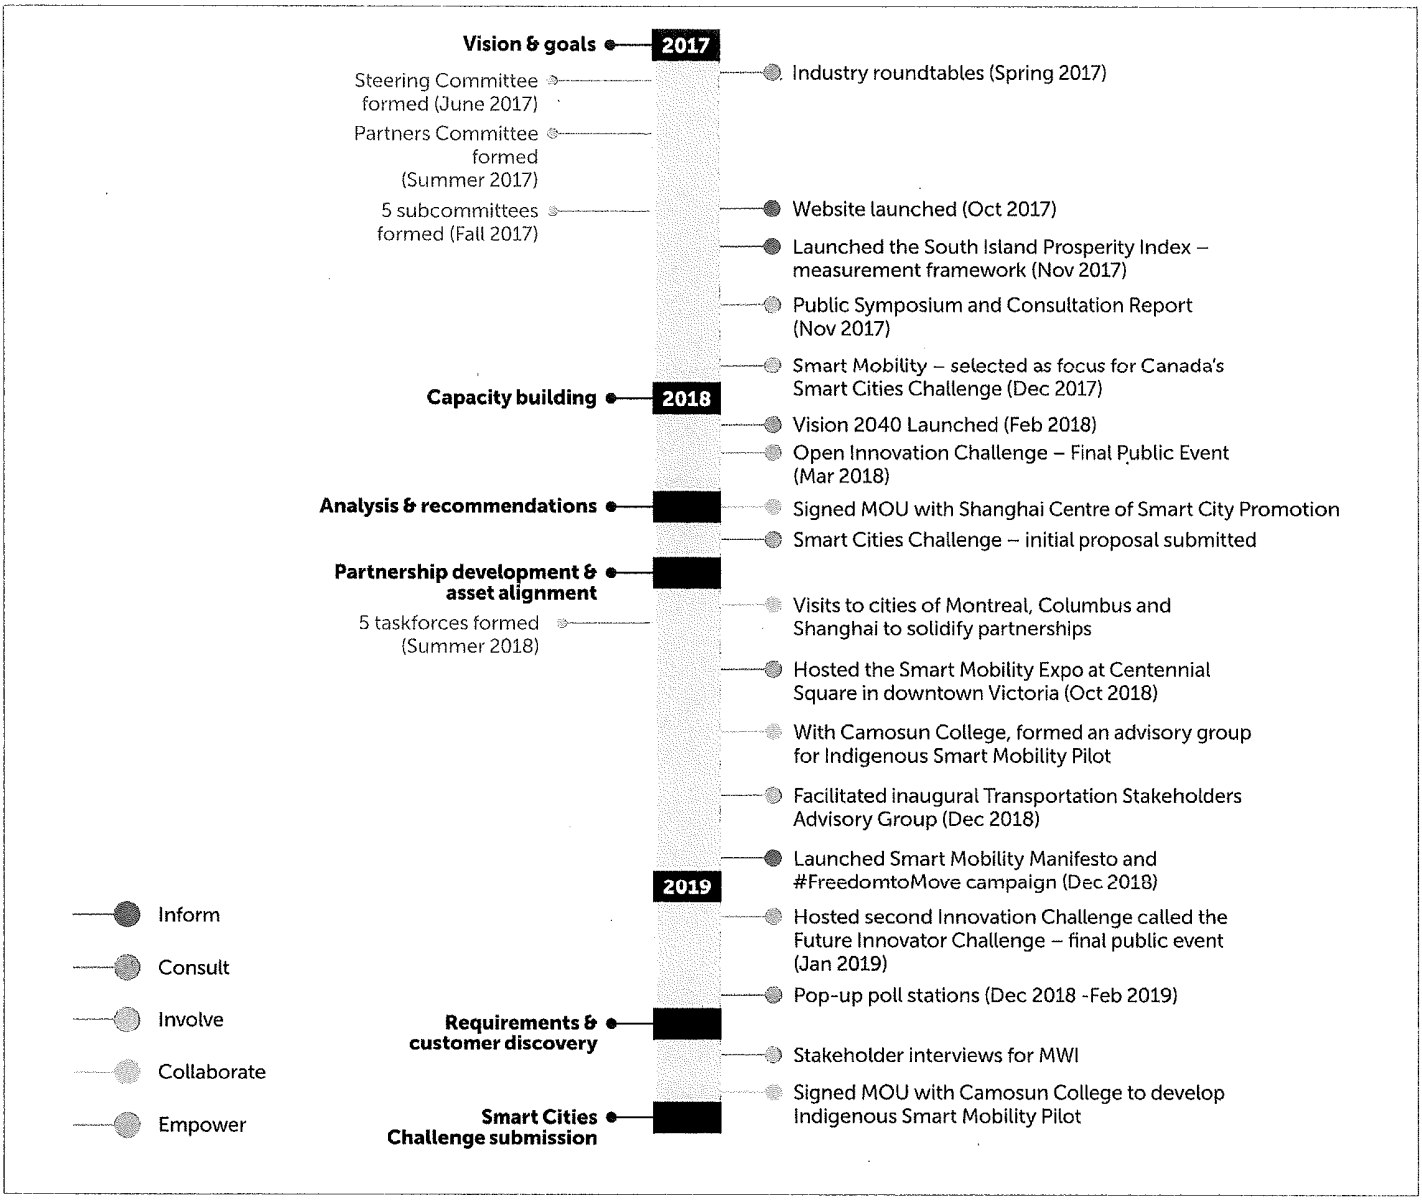

Figure 4.1: SIPP engagement timeline

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4.3.1 DETAILED ENGAGEMENT DESCRIPTIONS

Kick-off stakeholder roundtables: Industry and stakeholder engagement around developing a regional strategy to promote Greater Victoria as a centre of excellence for "clean, connected and competitive cities" with the University of Victoria (UVic), yielding ideas, dialogues and engagement that informed our SCC initial submission.

Steering Committee: Coordinates broad outreach efforts, ensuring that all stakeholders are represented.

Partners Committee: Advises the Steering Committee, playing an active role in shaping and developing Vision 2040 and our SCC proposal (Chapter 3).

Website and social media platforms: Public engagement website launched in September 2017 (www.smartsouthisland.ca) as a platform for involving the public in SIPP issues and initiatives. This is augmented across multiple social media platforms.

South Island Prosperity Index: Annual reporting index, to be updated in March 2019, provides a snapshot of the region's wellbeing, measures progress on five outcome statements through 140 indicators (in alignment to the World Council on City Data's ISO 37120 framework) and compares these to Canadian peer cities to add context.

Smart South Island Public Symposium: Public event, attended by over 350 people and facilitated by award-winning Canadian urbanist Charles Montgomery to exchange ideas with citizens and share information about the SCC challenge themes. Incorporated innovative tools such as real-time polling on smartphones to gauge opinions.

Sub-committees: Representing 50 organizations and active November 2017 to March 2018, engaging stakeholders and industry leaders to provide expertise, engage target audiences and refine the initial proposal.

Open Innovation Challenge: SIPP engaged residents as co-creators in addressing Smart City innovations related to outcome statements. Produced 69 projects over eight weeks, with 10 finalists selected by a jury. The top three finalists received $15,000 grants, and the three projects are currently in implementation under SIPP guidance.

SIPP Taskforces: SIPP taskforces guided initial SCC proposal, oversees the MWI, hosted pop-up polls and special events, engaged youth (Chapter 3).

Stakeholder and peer city consultations: Strategic knowledge sharing with both stakeholders and international peers—including Victoria Disability Resource Centre; Intercultural Association of Victoria; Canadian National Institute for the Blind; peer cities (noted earlier); BC Office of the Privacy and Information Commissioner; BC Minister of Transportation; BC Minister of Jobs, Trade and Technology and BC Minister of Finance (August 2018–February 2019).

Smart Mobility Expo: Expo of over 25 vendors designed to introduce citizens to the spectrum of smart, multimodal options available now, or in the near future, including an electric ferry, smart buses, e-scooters, carshare, hoverboards and electric bikes.

Transportation Stakeholders Advisory Group: Convened over 30 transportation stakeholders from both public and private sectors to discuss data sharing, collaboration and regulatory policy.

Smart Mobility Manifesto and #FreedomtoMove Campaign: Campaign in support of SIPP's SCC challenge statement and Smart Mobility Manifesto, collecting citizen-submitted videos using the hashtag #FreedomtoMove. Campaign included ads on buses, TV, radio, and in newspapers.

Travel habits survey: To understand current consumption and attitudes among a diverse range of people. Survey yielded over 500 responses over 12 weeks.

Future Innovator Challenge: Second innovation challenge in partnership with post-secondary and secondary schools, yielding nearly 80 student submissions. Six finalists were shortlisted and made a final live pitch to judges and the general public.

Pop-up Polling Stations: Yielded over 50 hours of engagement and 300 face-to-face conversations, with a focus on reaching residents who may not have access to web-based materials. Camosun College and University of Victoria were among hosts.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

4.3.2 KEY FINDINGS

After meeting face-to-face with hundreds of citizens and stakeholders in Greater Victoria, and engaging indirectly with thousands more through surveys, campaigns and online impressions, we learned a lot about our fellow citizens and their needs, aspirations, challenges and hopes for the future. We reaffirmed how valuable citizen-inspired action is to our mission and to achieving our shared vision for a smart mobility future.

Key insights and lessons learned during our two-year engagement process now form the foundation for our SCC approach. These include the following:

Co-design produces meaningful direction

A broad spectrum of SIPP members and citizens actively guiding and participating in decision-making creates proof points and strong buy-in at each engagement stage. SIPP's Partners Committee plays a critical role as a connection point between each government body and the SIPP Steering Committee, ensuring smooth communication and engagement and meaningful outcomes.

By bringing a broad spectrum of transportation stakeholders together, SIPP achieved consensus on a set of data-sharing principles. From this, SIPP developed a list of 10 Principles for Emerging Multimodal Options, which was shared with the BC government to inform provincial legislation for ridesharing industries slated for fall 2019.

Validation from citizens

We listen, iterate and innovate through our engagement activities. Respondents to our transportation surveys contributed data and feedback that helped inform and validate the SCC proposal by affirming two critical issues:

- Our region is not sustainable along its current path.
- More and better access to transportation is the solution to this challenge.

Following the launch event of our 2017 Prosperity Index, we engaged and empowered the audience to suggest and provide guidance on how SIPP might improve and update its next iteration. Through their involvement, we learned of citizen's strong interest in learning more about the linkages between social, environmental and human health impacts, which inspired and drove our creation of the MWI.

Taking advantage of new tools

We use a wide variety of smart tools in our engagement activities and will continue to learn, share, and develop new engagement tools to reach, collaborate, and connect with citizens. We used smart technology to conduct real-time polling at engagement activities, enabling us to quickly and adeptly understand our audiences, as well as to identify which citizens we were not reaching. For example, youth were underrepresented early on, which led us to create the Youth Liaison Taskforce.

Through their student-focused engagement, SIPP's Youth Liaison Taskforce identified a previously unknown need to educate high school youth about their digital rights, an issue being introduced around the world to inform, educate, and engage youth in understanding their rights and relationship to data. The Taskforce is currently developing a digital literacy information kit to share with local high schools. This is a tool that could be replicated and scaled for use across many jurisdictions to foster "smart citizens" from an early age.

The Youth Liaison Taskforce discussing smart mobility and regional transportation issues with University of Victoria students

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Engagement objectives

1. Ensure the long-term viability of the program
2. Ensure that diversity and inclusion goals are met and that all residents, including those most underrepresented, feel that their voices can shape the projects
3. Enlist residents as co-designers of projects
4. Ensure that partners provide input at key stages of implementation
5. Ensure that governments (at both political and staff levels) are consulted at appropriate stages of implementation
6. Ensure that ongoing engagement is embedded into project design

Readiness for Indigenous Smart Mobility Pilot

Through close consultation with First Nations communities, education facilities—Camosun College, Saanich Adult Education Centre (SAEC) and University of Victoria—we have been able to engage Songhees First Nations, Beecher Bay and SAEC to survey students on their travel patterns and how this aligns with the current transport services. Through this engagement with multiple First Nations communities, we have been able to secure the use of existing community-owned and -operated vehicle assets (community buses, vans, personal-use vehicles) to be used for the Indigenous Smart Mobility Pilot. The level of coordination and collaboration is a testament to the shared vision that these communities have, to improve the mobility options available to their students and residents.

BC Transit has also offered driver training to those communities for the pilot further demonstrating the engagement and collaboration that has been performed to make this a reality.

4.4 ENGAGEMENT PLAN FOR IMPLEMENTATION PHASE

The following engagement plan for our implementation phase ensures that our process builds on the co-design approach and focuses on diversity, inclusion and equity, while remaining accessible to everyone across the region. Our engagement objectives (see above) will be the lens through which we plan, develop and make decisions regarding our engagement and outreach activities. We will encourage our partners and co-designers to do the same as we advance our decisions and designs and move into implementation.

4.4.1 TARGET ENGAGEMENT GROUPS

Building on our activities to date, engagement of a broad cross section of Greater Victoria residents will be critical to driving program implementation. However, we will prioritize our three co-design target groups (Indigenous students, seniors and new employees) throughout our implementation engagement plan.

This section highlights the primary groups we intend to engage during the implementation phase. A comprehensive list of implementation partners, who are critical to achieving our outcomes, can be found in Chapter 3 and Appendix 3.

4.4.2 STAKEHOLDERS AND PROJECT PARTNERS

To ensure effective design, development and implementation of all project components, SIPP will engage stakeholders and partners that span a variety of disciplines. They are outlined in general categories below as they relate to our engagement plan. A comprehensive list of our implementation partners, who are critical to our engagement initiatives, can be found in Chapter 3 and Appendix 3.

4.4.3 GOVERNMENT PARTNERS

SIPP's government partners are crucial to our organization, as well as to our engagement and implementation plans. To ensure that project design and implementation are coordinated with both existing and future infrastructure or investments, local municipal and First Nations communities will

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

be consulted through various engagement activities across all project stages. Beyond SIPP's existing government partners, we will focus our engagement on government ministries, agencies and institutions that have a role within the mobility and transportation industries. We aim to use smart city funding at critical moments, to align with provincial government funding opportunities and to identify when and how we can best align our projects alongside BC Government initiatives and opportunities.

4.5 ENGAGEMENT METHODOLOGIES

This section highlights how, when and at what levels we intend to engage with our citizens and stakeholders during the implementation phase.

4.5.1 KEY ENGAGEMENT DESIGN PRINCIPLES:

- **Lead with diversity:** SIPP's citizen-inspired approach and diverse governance model is designed to maximize inclusiveness of residents and stakeholders, ensuring our design process and projects benefit a wide variety of people including those who are often underrepresented. SIPP has received international recognition for its governance model.

- **Engage across the whole spectrum:** We go beyond traditional levels of consultation and embrace direct participation. SIPP has piloted two open innovation challenge competitions and incorporated this approach into the SSIIC.

- **Co-design:** Because SIPP's experience with co-design, and our plans to continue to use it throughout implementation, we are confident we can deliver better and more inclusive ways to achieve our outcomes (Chapter 6).

- **Measure early and often:** Engagement is a key component of social outcomes. SIPP's MWI is an ongoing engagement and measurement tool. Users will be able to submit feedback about journey satisfaction, access information to inform decision-making and access data that helps gauge willingness to change modes or behaviour. By tracking these metrics—from user engagement to their journeys and mode shifts—we will establish a method of measuring and achieving outcomes.

4.5.2 ENGAGEMENT ACTIVITIES

Our challenge theme "freedom to move" anchors our vision for a shared mobility future in Greater Victoria that is designed by and for citizens and as a result, provides a vibrant, innovative and measurable approach to engagement with our communities.

Key Activity: Ongoing guidance and leadership

Steering Committee: The Steering Committee will be expanded during SCC implementation to ensure a broad and diverse group of stakeholders are contributing to critical decisions at key Stage Gates and on issues of specific interest or expertise.

Partners Committee: Municipal and First Nations leaders will continue to be engaged through this committee. It remains an effective way to liaise with multiple governments at once at critical Stage Gates.

Engagement levels: Inform, consult, involve

Key Activity: Public and stakeholder engagement

Webpage: SIPP will maintain the Smart South Island website through all phases of implementation to build awareness for the SMP so we can establish baselines for addressing behavioural changes that will improve outcomes.

Smart Mobility Manifesto and multimedia campaign: This multimedia campaign will continue to roll out over the coming months as the region prepares for implementation. Awareness will be key to deeper levels of engagement during the implementation phase. Other cities, including Montreal and Columbus, have expressed interest in adopting this Manifesto as a ready-to-implement toolkit.

South Island Prosperity Index: This regionwide annual report card is an annual opportunity for SIPP to report on overall progress of Smart South Island, along with the macro-indicators about the region's progress toward Vision 2040.

Engagement levels:
Inform, involve, collaborate, empower

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Key Activity: Engagement through co-design

Project 1: Integrated MaaS

We will conduct initial engagement activities with the three co-design target groups (and relevant partners including W̱SÁNEĆ School Board and First Nations governments, senior service centres, the Disability Resource Centre and the Intercultural Association) through focus groups, followed by beta-testing groups to provide active co-design inputs to the service and technology developers.

Project 2: STP

Engagement will involve multiple touch points but primarily will focus on the three co-design target groups.

Mobility Wellness Index

The first iteration (March 2019) will present the framework, as well as showcase the dynamic indicators that will be developed in the future. This version will be used to capture feedback from various target audiences through focus group sessions, going beyond the engagement activities described above that were used to design the beta MWI.

On an ongoing basis, MWI will become the primary tool that will allow residents to better understand their mobility experience and influence behavioural change (for example, features that show how their wellness has improved or their carbon footprint has been reduced through their mobility choices). Journey satisfaction and other data will be used to determine baselines and shortcomings of the mobility system and will inform policy and planning decisions.

Engagement levels: Involve, collaborate, empower

Key Activity: Ongoing consultation and citizen-led innovation

Project 3: SSIIC

Through the SSIIC, a diverse range of projects can be nurtured from ideation through to concept, to pilot and eventual scaling all while building public capacity and empowering our citizens.

Engagement levels: Consult, collaborate, empower

4.6 DIVERSITY AND INCLUSION FRAMEWORK

Beginning in 2017, we sought to understand the stories of people in our community who are disadvantaged and underserved by our current transportation system (see co-design target groups in Chapter 1). Building a regional transportation network that serves everyone requires a profound understanding of how certain groups are excluded. As explored throughout this chapter, SIPP is addressing this issue head-on by co-designing the early iterations of the MaaS solution alongside our three co-design target groups, before scaling solutions up to serve broader sets of users that face similar challenges (Chapter 1).

4.6.1 CO-DESIGN TARGET GROUPS: CONTEXT AND SCALE

Indigenous students: There are 10 First Nations communities and 17,245 Indigenous people on South Vancouver Island. Only two of the 10 reserves are close enough to the urban centre to access education and career opportunities off-reserve. The other eight are rural, remote and not served by public transit; their residents have less access to education and career opportunities, and spend a higher percentage of household income on transportation.

Scale: Engage to test and scale to other rural and remote populations regionally and nationally.

Seniors: As a popular retirement destination, Greater Victoria is home to an aging population that is far greater than other cities (21.1% of our citizens are over age 65, compared to the national average of 16.1%).

Scale: Engage to test and scale to other unique mobility users, who—if offered reliable, customized and convenient mobility options—would make more recreational and social trips (such as citizens with mobility challenges or accessibility needs).

New Employees: New employees encompass a significant percentage of people moving into Greater Victoria. These include, but are not limited to, Canadians moving in from other areas, immigrants, new students, and others who are

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

just arriving in Greater Victoria. We must engage and embrace new residents in our communities and workforces to maintain our region's strong economic competitiveness.

Scale: By meeting the unique mobility, information and engagement needs of new residents, we can scale to other populations, like our region's large international student population for example, as they would benefit similarly.

4.7 RISK MITIGATION

Table 4.1: Risk mitigation strategies

RISK	MITIGATION STRATEGIES
Lack of trust between target stakeholders/ partners/ governments	SIPP's inclusive governance model has representation from a diversity of groups as members who will be engaged fully throughout implementation. We will continue the efforts that have been made throughout the process to build long-term relationships and trust by consistently engaging, building in time for continuous communication, reporting back on results and allowing time for validation of results.
Difficulty engaging the general public on highly technical content	We will invest time in translating complex technical content into accessible engagement materials. By developing clear key messages and breaking down complex ideas, we will ensure the public remains engaged and interested. We will also enlist our co-design target groups to create public-facing content that is more palatable to their user groups and to general audiences.
Our co-design target groups face barriers to participation	We will work with project partners to understand the barriers these groups may face in engaging with our work. We will reduce these barriers where possible (i.e. travel subsidies, accessible venues, accessible materials, online and in-person, etc.). In other words, we will 'meet them where they are at' in both physical space and capacity to engage.
Perception that decisions are being made behind closed doors	The results of our engagement activities will be communicated back to participants (and made public) in summary reports that highlight what was heard and how it influenced decision-making. SIPP's governance structure is built on collaboration and having many voices around the table. We will clearly communicate who is making decisions and how they are being made. The SSIIC will also encourage transparency and discovery.
Overlapping and potentially conflicting interests of numerous partners or tensions between user groups/perception of inequality	SIPP's governance model is independent and often coordinates the shared interests of its members. SIPP is viewed as an "arms-length" organization, meaning its structure as a public-private partnership enables it to act on behalf of the public good and is not beholden to any particular group(s).
Certain voices dominate the process	We will maintain contact lists, track participation and categorize information shared (disaggregating for co-design target groups and gender) to help us understand who is participating, whose perspectives we are missing, and how the issues and needs of different stakeholder types differ. We will engage our co-design target groups in each stage of implementation to ensure diverse and inclusive voices are not just included but are meaningfully incorporated throughout.
Expectations that mobility projects will immediately solve the region's transportation issues	We will manage expectations by communicating and reporting regularly on expected outcomes and timelines in a transparent and realistic way through our engagement materials and through SSIIC and by measuring our progress with our identified performance measurement tools and standards (Chapter 7).

CHAPTER 4 LINKAGES TO OUTCOME THEMES

Affordability

Engaged Songhees and Sc'ianew Nations and SAEC to coordinate existing vehicle assets for the Indigenous Smart Mobility Pilot to keep costs down

Wellbeing

The Youth Liaison Taskforce is developing a digital literacy kit for local high schools that could be replicated in other cities

MWI ongoing engagement and measurement to gauge wellbeing through both quantitative but also, highly engaging 'gamification' methods to collect qualitative data and influence behavioural change

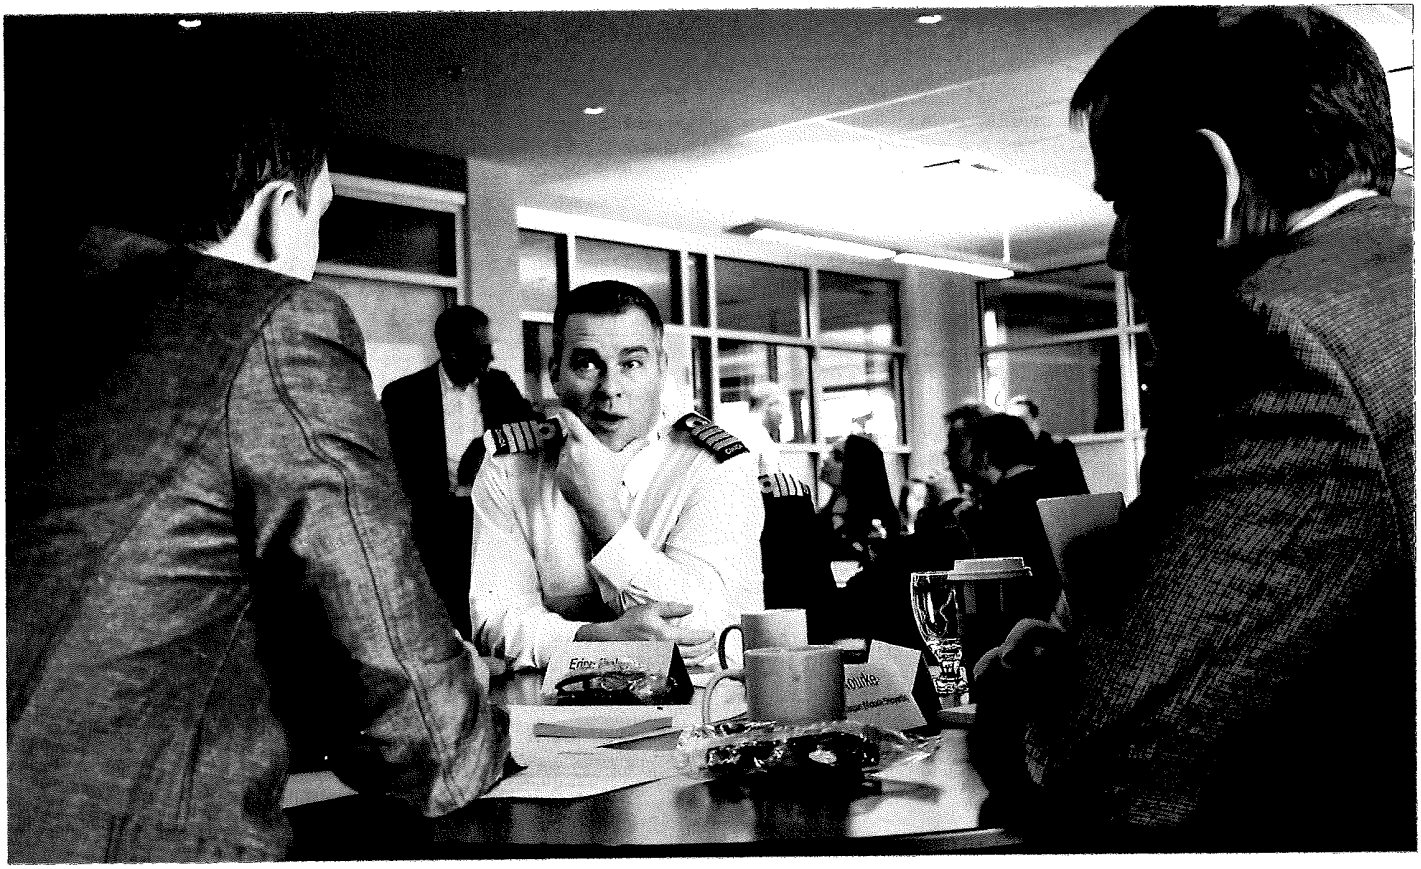
Inclusivity

The collaborative inclusive membership model

SIPP's many engagement activities have involved diverse people and perspectives and have informed us on gaps and future engagement plans

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

CHAPTER 5
Data and Privacy



"Data has the power to transform our communities, but only when it is valued less as a commodity and more for its potential to improve citizens' lives. This is the driving ethos of our Smart South Island Inspiration Centre."

– Mike Palmer, Co-Chair SCC, Data and Privacy Taskforce, Chief Information Officer, City of Victoria

5.1 DATA AND OUR PROJECTS

Data are fundamental to the success of the three projects in the SMP. The integration of transport data throughout our projects will enable Greater Victoria residents to make more convenient, affordable and green mobility choices. Data from these transport operators, combined with other civic data sources in the SSIIC, will provide input into the MWI, which allows us to monitor progress towards our outcome statements (Chapter 1). It will also help citizens, planners and decision makers in local communities to understand the impacts of transport on broader outcomes. Over time, the sharing and integration of regional transport, demographic and environmental data can drive the development of technological innovation and community-owned solutions here in Greater Victoria.

As described in Chapter 2, the SSIIC will integrate data to enable two primary use cases: for MaaS and for visualization and analysis. Table 5.1 outlines the data that we plan to integrate into the SSIIC, describing the owner, availability and use case, as well as when we plan to integrate this data (aligned with the Stage Gate approach described in Chapter 6).

Stakeholder workshop on MaaS, privacy and data sharing

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 5.1: Data sources for SMP projects (preliminary list)

Owner	Data	Availability	MaaS	Analysis / Visualization	Stage Gate
BC Transit	Transit routes and schedules	Open	☑	☑	1
	Real-time vehicle location	Open	☑	☑	1
	Passenger counts by route	Public		☑	2
	Current fares	Open	☑	☑	1
BC Ferries	Routes and schedules	Open	☑	☑	1
	GPS ferry location	Public	☑	☑	2
	Booking platform	Private	☑		3
Taxis	Real-time taxi location	Private	☑		2
	Booking + payment platform	Private	☑		2
	Number of trips by origin-destination	Private		☑	3
	Travel time from origin to other locations	Private		☑	3
Uber/Lyft	Real-time vehicle locations	Private	☑		2
	Booking + payment platform	Private	☑		2
	Number of trips by origin-destination	Private		☑	3
	Travel time from origin to other locations	Private		☑	3
Modo (Carshare)	Car location map	Private	☑	☑	1
	Booking + payment platform	Private	☑		2
U-bicycle (Bikeshare)	Bike location + real-time availability	Private	☑	☑	1
	Booking + payment platform	Private	☑		2
Capital Region District (CRD)	Cycling routes in Greater Victoria	Open	☑		1
	Traffic counts	Open		☑	1
City of Victoria	Parking locations	Open	☑		1
	Booking + payment platform (ParkVictoria)	Public	☑		2
	Traffic counts + speeds	Open		☑	1

	Household spending	Public		☑	2
Municipalities	Employment locations	Public		☑	2
	Community amenities	Open		☑	1
Insurance Company of British Columbia (ICBC)	Licensed vehicles in Victoria	Private		☑	2
Victoria Real Estate Board	House prices	Private		☑	3
Environment Canada	Daily weather	Open		☑	1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5.1.1 BIG DATA, OPEN DATA AND SHARING

As described in Table 5.1, some of these data sources are readily available as open data. We are prioritizing the use of open data during Stage Gate 1 to deliver an initial product quickly. We will encourage the use of open data and international standards for sharing transport information (such as General Transit Feed Specification, or open data feeds for transit schedules and fares), as this makes our work interoperable, scalable and replicable with other regions across Canada and beyond.

Our projects also rely on public and private data that are not currently open but are owned by transit operators, government or other third-party organizations. In these cases, we are ready to engage and partner with these organizations to enter into a data sharing agreement so that their data can be made openly available to the public. We will also develop data access agreements for third-party organizations who wish to use the data to develop MaaS or other transportation applications as part of the SMP. Citizens, researchers, planners and analysts may also access the data through an appropriate open data license (such as Open Government License or Creative Commons License). Figure 5.1 illustrates the relationship between data providers and consumers from a data and organizational perspective.

By integrating these data sources into a common platform that is open and accessible, the SSIIC will be an invaluable component to the SMP, as it can be used to combine different datasets together to consistently update the MWI and derive new insights into mobility and communities. The SSIIC will house tools for citizens to perform this analysis themselves (Chapter 2), enabling citizen-inspired solutions through innovation and entrepreneurship. Table 5.2 shows a selection of insights that could be derived by combining multiple data sources.

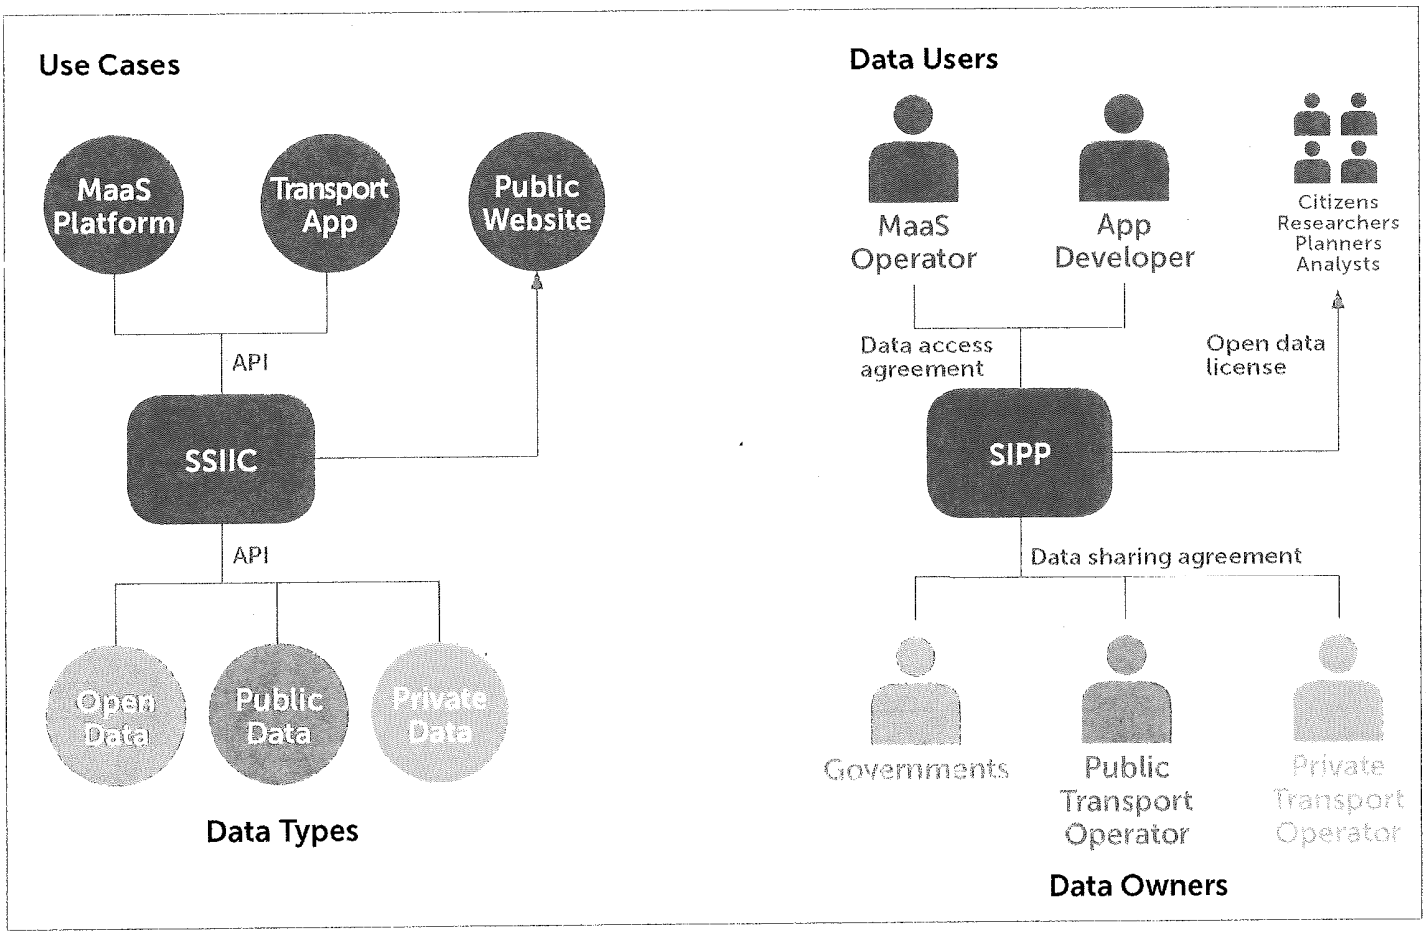

Figure 5.1: Types of data, owners, users and agreements

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 5.2: Sample insights generated from big and open data

Outcome	Insight	Datasets
Convenience	Amenities accessible within 30 minutes by transit or cycling	• Amenity locations • Transit routes and schedules • Cycling network
Affordability	Average cost to travel by car or transit to downtown Victoria	• Transit routes and fares • Road network and distances • Average fuel prices
Wellbeing	Mode shift by trips to cycling, walking, transit	• Cycling trip counts • Walking trip counts • Transit ridership by route
Green	Change in car trips compared to current population	• Average yearly daily traffic counts • South Island population
Inclusivity	Jobs accessible within 30 minutes of First Nations reserves by transit	• Employment locations • Transit routes and schedules • First Nations locations

5.1.2 DATA COLLECTED FOR MAAS AND STP

To enable the desired functionality for the MaaS and STP we will collect, store and process personal data (as shown in Table 5.3) in line with our data management plan and policy (described in the following section). We will explain clearly to users why we are collecting their personal information.

5.2 DATA AND PRIVACY PLAN

Having a clear plan and approach to data management increases confidence of users, data sharing partners and the public that their data and privacy will be protected. This section outlines our data management plan, through the lens of all three projects and the MWI. We describe our data policy and principles in line with best practices and outline how these meet the relevant data and privacy legislations within British Columbia and Canada.

The data used within this project will follow these principles:

- Accessible to the public through SSIIC
- Publicly sourced and community-owned (not owned by the private sector)
- Collected, used and disclosed through transparent consent
- Volume of data shall be minimized and de-identified
- Stored and transmitted securely under assurance of effective cybersecurity

Adhering to these principles will support the transferability and replicability of the projects and associated technologies.

5.2.1 DATA TRUST, GOVERNANCE AND OWNERSHIP

A data trust is a mutual organization formed to provide governance, decision-making and oversight on critical issues regarding the management of data. Our data trust will consist of a group of mixed stakeholders, comprised of representatives from the public and private sectors, as well as implementation partners and citizens. This diversity will help keep data policy interpretation open and able to be challenged from different viewpoints. This is also a way of extending control over data to the users from which it is gathered, reinforcing the principle of being community-owned.

The data trust will conduct regular reviews to oversee changes pertaining to individual aspects of the data lifecycle: generation, storage, reuse, redistribution and archiving of data. The outcomes of these reviews are imperative to holding external organizations accountable. The reviews will allow for regular engagement throughout the progression of the three projects and will prevent private-sector ownership, thus maintaining community-owned and -controlled data approaches to publicly sourced data.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 5.3: Data collected through MaaS and STP

Data	Examples	How is this collected?	Why are we collecting this information?
Name	First + last name	Users provide when they sign up for a MaaS account	To associate an account with a person
Credentials	Username + password	Users provide when they sign up for a MaaS account	To allow a user to securely access the service
Contact information	Email address, phone number	Users provide when they sign up for a MaaS account	To enable communication with the user in order to inform of any cancellations to a booked journey, invite to co-design sessions or to inform of updates to terms and conditions or the privacy policy.
Demographic information	Age, user group, preferences	Users provide when they sign up for a MaaS account	To enable personalization of the transportation options and fares (e.g. a lower fare may be shown for seniors)
Location	Trip origin + destination and route	Through the app interface when a trip is booked and via GPS during the duration of the trip	To understand (in aggregate) the travel behaviour and patterns in Greater Victoria and to populate a journey plan/ booking request
Mode choice	Transit versus other options	Through the app interface when a trip is booked	To understand (in aggregate) the travel behaviour and patterns in Greater Victoria and to populate a journey plan/ booking request
Payment data	Debit/credit card or bank information	Users provide when they pay for a trip using the MaaS account	To allow the user to pay for trips directly through the MaaS service and to enable quicker 'checkout' (with securely stored payment token)
User feedback	Trip satisfaction, stated wellbeing	Through the app interface, during or following a trip	To understand how a specific trip affects wellbeing

Additionally, we will appoint a Data Privacy Lead (also a member of the Data Trust) to enforce compliance with privacy regulations. Through this strategy, SIPP will act in the public's best interest and hence build trust.

5.2.2 CONSENT

It is imperative to be transparent when obtaining consent for data. In compliance with privacy regulations, to obtain meaningful consent organizations must inform users of the purpose of data collection, the data retention period, how and to whom the data will be transmitted and, outlined in clear terms, the data subject's rights to the control of their own data (access, erasure, update, etc.).

The strategy involves always pursuing the least privacy-invasive alternative wherever possible, minimizing the data collected, and anonymizing all personal information at the earliest opportunity, while mitigating the potential for re-identification. The data should be used to improve the three projects and the MWI and will only be stored for as long as deemed necessary for improvements or updating of the initiatives outlined in our initial SCC proposal.

We will hire a third-party company that is highly competent at anonymizing collected data and ensuring the anonymized data containing Personally Identifiable Information (PII) cannot be re-identified when disseminated. We assume that existing data outside of our ownership and collection complies with privacy regulations as appropriate.

The open data policy invites the public to contribute data through openness and transparency. This data will be used to drive community-owned solutions such as MWI and inform strategic and regional plans.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

5.2.3 SECURITY

Cybersecurity is a critical component of the MaaS and SSIIC platforms, which involve PII. Within the SMP, users can expose their PII knowing with confidence that it 1) is only being accessed by trusted and vetted third-party partners, 2) is encrypted and 3) is accessibly only through two-factor authentication.

Our system will deploy security solutions through the following methods, which address trusted vendor and customer relationships, encrypted PII and human error:

1. Trusted suppliers and customers: Third parties will need to have access to our data platform to create and deliver value to the citizens of Greater Victoria. Traditional security solutions using IP-based identification have been proven by cyber criminals to be easy to defeat. SIPP will implement a DNS firewall that our networks can only communicate with the domains of trusted suppliers and customers on an established domain white list. Everything else will be blocked.

2. Encryption triad: There are three stages of data encryption: 1) at rest, 2) in transit and 3) in use. SIPP will work to implement all three phases of encryption of the PII data. Nation State attacks are usually successful when data is In Use. Until recently, processing power and technology has been a limiting factor for In Use encryption. With the emergence of Homographic security, SIPP will ensure that In Use data is always encrypted.

3. Multifactor authentication (MFA): Google and European banks have mandated the use of MFA. Humans are the greatest risk to a network, and MFA prevents credential theft from occurring. For example, users must complete a login process by entering a code sent to their mobile phone.

Beyond the technical elements of our privacy protection scheme, the Data Privacy Lead will ensure all attempted breaches are reviewed to continually monitor our security profile.

5.2.4 DATA AND PRIVACY REGIMES

As SIPP is a NFP organization within British Columbia, we are regulated by the BC Personal Information Protection Act (PIPA). This act balances individual rights to protect personal information with an organization's need to collect, use or disclose it. We have developed our data management plan to meet this standard (5.2 Data and Privacy Plan). Within Appendix 2, we include our preliminary Privacy Impact Assessment (PIA), which was prepared in consultation with the Office of the Information and Privacy Commissioner for BC.

Only trusted third-party partners will have access to users' PII.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 5.4: Data privacy principles and our plan for compliance

Privacy principle	How will we comply?
Accountability	The Data Privacy Lead will be responsible for compliance with applicable privacy legislations, as well as for handling access requests and privacy complaints. We will make the name and contact information of this individual public.
Identifying the reasonable purpose	We will identify the reasonable purpose for the collection, use or disclosure of personal information that is required to deliver the services developed for the projects. We will use clear, understandable language to notify individuals of the purpose.
Consent	We will clearly and concisely notify users of the purpose of data collection through an easy-to-understand privacy statement and end-user license agreement. Individuals will provide express consent (through the website or app) prior to using the service and can withdraw consent at any time.
Limiting collection	We will ensure that the information collected will be limited to the purposes identified before or at the time of collection.
Limiting use, disclosure, retention	We will limit the use, disclosure and retention of personal information to what has been consented to or to what is allowable under PIPA. We will notify and request consent from individuals should the purpose change. We w ill limit retention for as long as required. This will be reviewed by the Data Trust.
Accuracy and correction	The collected personal information will be kept accurate, complete and up-to-date as possible to satisfy the purposes for which it is collected. We will correct errors or omissions to personal information as requested by individuals. We will provide users with the ability to update their own profile.
Protection and safeguards	We will build data protection into the core design of all systems, rather than as an addition at a later stage. We will use state of the art data anonymization methods such as differential privacy, geomasking, and k-anonymity to preserve privacy throughout the collection, storage, and use of all data containing PII.
Individual access	An individual can challenge or amend information as appropriate. The individual can also be informed of the existence, use and disclosure of personal information and given access per request. We will provide an electronic copy of personal data and/or any supplementary information to participants as requested.
Challenging compliance	We will provide a simple form for users to communicate any questions, concerns or complaints related to their personal information. An individual may complain to the Office of the Information and Privacy Commissioner should we fail to meet our obligations. We will cooperate with the Commissioner's Office.
Openness	We will ensure our policies and practices relating to the management of personal information are publicly and readily available through web platforms and apps. Citizens can also request information from our Data Privacy Lead.

We will engage citizens in 'hackathons' to help develop solutions for problems identified by data in the SSIIC.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

5.3 RISK MITIGATION

Table 5.5: Risk mitigation strategies

RISK	MITIGATION STRATEGIES
Loss of public trust or negative public perception over nature of data openness uses related to projects and data privacy standards	We have developed an engagement plan to keep the public informed and engaged along the journey (Chapter 4). The co-design process ensures that touchpoints and processes both comply with legislation and best practice but also produce trust and confidence in users' terms. Each service will have a unique set of Terms and Conditions and a privacy policy (which conforms to the applicable data protection laws of the operating country) with the co-design group helping to ensure these terms are accessible and understood by the target audience.
Vulnerability against breaches, damage as a result of potential data breach	Enforce data sharing partners (municipalities, industries, mobility service providers, etc.) to be compliant with the applicable regulation. The data-trust is will be independent, treating all parties equally, and will conduct thorough reviews for robustness of partner companies' cybersecurity policies, processes, procedures and readiness.
Possible re-identification of data	Hire a third-party company who is highly competent at anonymizing collected data and ensuring anonymous PII. The data-trust plans to incorporate or adhere to new data privacy standards, tools and practices as they emerge, which could include incorporation of self-sovereign identity or blockchain authenticated identity.
Security of collected PII data	Implement physical, administrative and technical safeguards to minimize access to personal information. This includes the separate storage of data by classification into a tiered system. Access will only be provided to individuals as required for the identified purpose of delivering the services.

CHAPTER 5 LINKAGES TO OUTCOME THEMES

Convenience

Access to open and big data makes MaaS solution more convenient for users

Wellbeing

Data from transport operators, combined with other civic data sources in the SSIIC, will provide input into the MWI, which allows us to monitor progress towards our outcome statements

Data will be used to drive community-owned solutions such as MWI and inform strategic and regional plans

Inclusivity

The SSIIC will house resources for citizens to perform this analysis themselves enabling citizen-inspired solutions through innovation and entrepreneurship

The open data policy invites the public to contribute data through openness and transparency

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

CHAPTER 6
Project Management

"It's a bad plan that admits of no modification."
– Publilius Syrus

6.1 INTRODUCTION AND APPROACH

Complex, innovative projects with sub-projects and multiple stakeholders can deliver breakthrough results. At the same time, they are also subject to a host of challenges such as schedule slip, insufficient customer connection and coordination challenges between stakeholders and siloed sub-projects.

To avoid these issues and ensure success, we will employ aspects of the Scaled Agile Framework (SAFe) to our projects. The SAFe approach promotes alignment and collaboration between teams and stakeholders, which in turn helps ensure our desired outcomes for the design and implementation across the three project teams. It applies lean innovation concepts and ensures early and frequent customer involvement, rapid and continuous iteration and validated learning through constant end-user engagement and iterative design.

As an innovative addition to SAFe, we have developed an Outcomes-Based Project Feedback Loop (Figure 6.1), which combines a Stage Gate approach (divided into key milestones in program delivery and evaluation) with SAFe principles.

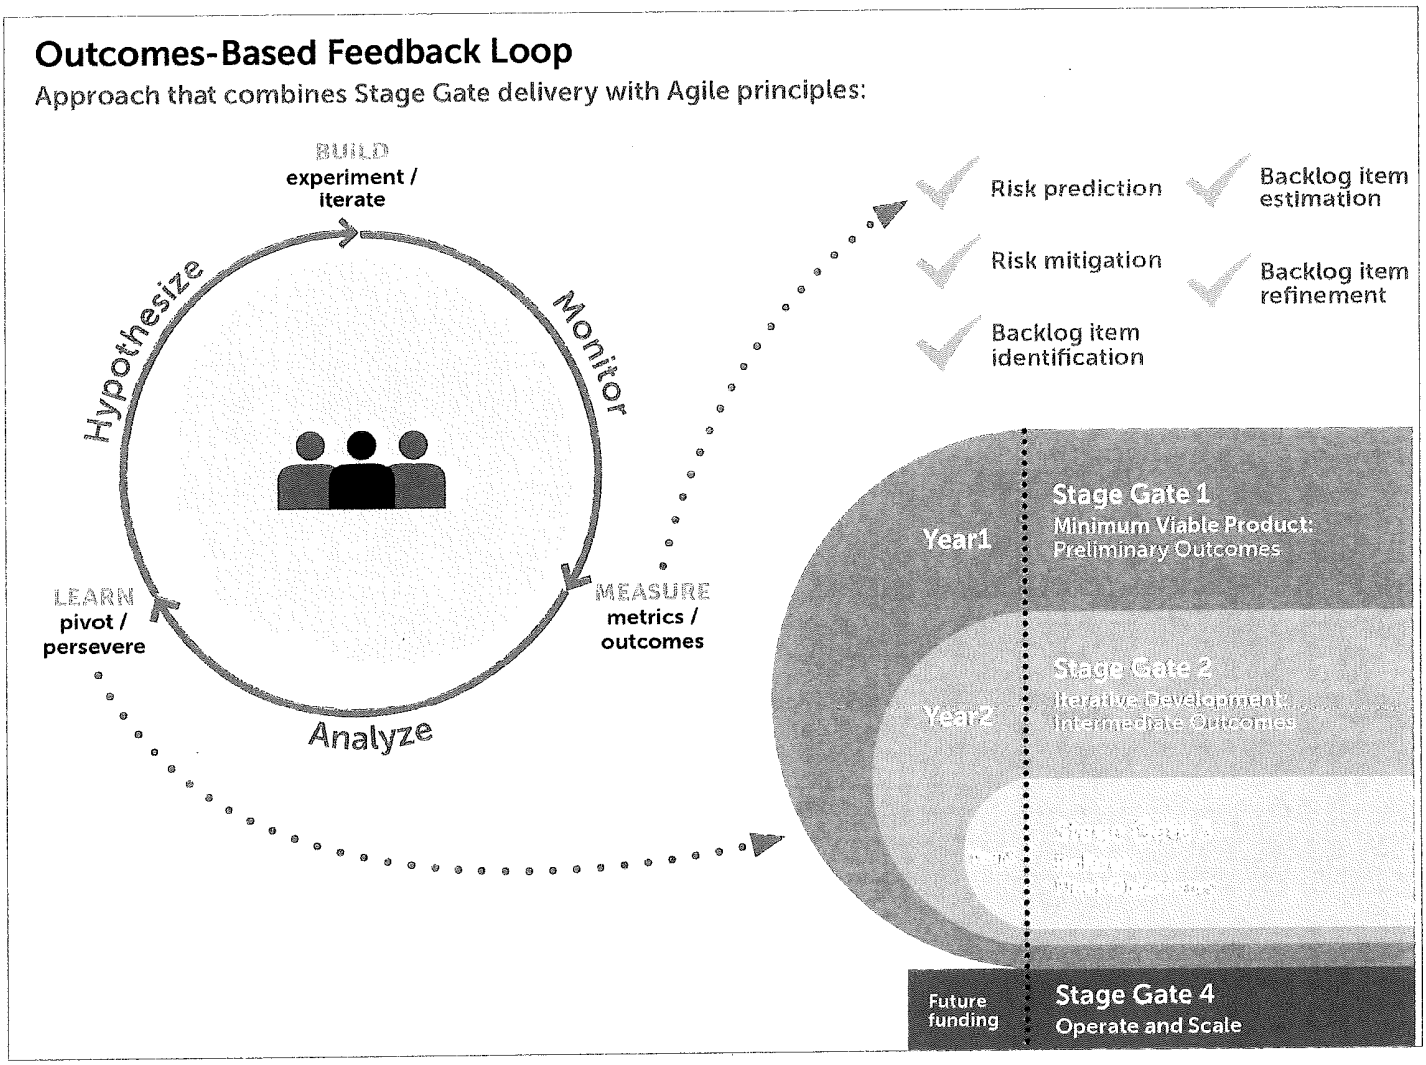

Figure 6.1: Outcomes-Based Feedback Loop

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

This ensures we deliver frequent releases to our customers, while also ensuring we deliver on our longer-term program outcomes. This concept will be further elaborated below.

6.1.1 PROGRAM MANAGEMENT OFFICE

To manage the SMP we will establish a Program Management Office (PMO). The PMO will run quarterly sprint review and planning sessions to discuss project progress to ensure alignment across the three project teams around agreed outcomes for the next quarter. These sessions will bring together the three project teams, along with the key stakeholders, to both review and align design and development and to plan the next iteration. This protocol will help to manage risk and dependency between the projects. To successfully deliver, we will incorporate the following into our project plans:

- The full range of services/functionality to be delivered in each project
- The dependencies that exist between the projects, highlighting the critical path
- Technology and non-technology deliverables
- Resource needs and readiness for human resources, assets/materials and workforce capacity
- Any related initiatives already underway
- Management of the key stakeholders, delivery partners and the procurement process
- Reporting and communications plans to ensure individual projects are on track
- Risk management to work through known risks and use our Stage Gate and iterative design approach to identify and mitigate unknown risks

We will run a series of sprint reviews to demonstrate progress at each quarter to all stakeholders. In the early stages, these sprints will be vital to developing the minimal viable product (MVP), providing the teams with quick progress updates to decide to continue on the current path (persevere) or to review and reassess our concepts (pivot). Each project team will provide its product demonstrations in the same session, breeding cross-team alignment, early identification of risks, budgetary impacts and dependencies, as well as effective communication with stakeholders, the PMO and the Steering Committee.

This hybrid project management framework (SAFe with the Outcomes-Based Feedback Loop) builds consensus in advance at planned stages; each Stage Gate is delivered as an increment of the overall program, with a unified outcome in mind. Through regular iterative rollouts, the project teams will expedite development and improve predictability for future iterations.

Our PMO and Steering Committee will run quarterly sprint reviews.

6.1.2 CITIZEN-INSPIRED TRANSFORMATION

We recognize that 'no business plan survives the first encounter with the customer' as a warning that our process must maintain the customer at the core of our project management process. In fact, our motto "Citizen-Inspired Transformation" compels us to ensure that we hold this ideal true in all our actions—from engagement, vision setting and, of course, project management.

We will honour these commitments via our dedication to co-design target groups (through workshops, user story mapping and beta testing) to ensure that customer-valued features will be prioritized. As the costs of a missed feature increase exponentially through a project's lifetime, we expect to build quick, learn quickly and adapt quickly, which will ultimately pay dividends downstream as we scale to larger audiences. Hence, we have chosen three co-design target groups to focus on, deliver value, and ultimately move to adjacent, broader groups and applications.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

While some components of our projects will allow for direct connection to customers in real time, many others will require beta group feedback with selected group of advanced customers. This high-trust relationship helps ensure that new project features, systems, and services can go through early testing and evaluation in advance of broader release.

At key points in the project (major release cycles), we will lock features and capabilities to create the deliverables and functionality at each Stage Gate. This will provide the project management team a chance to analyze and measure outcomes, with a view to either pivot or persevere with the design and functionality.

The diverse set of professional skills required to deliver these projects is a significant resource requirement. We will need project team resources as well as engaged stakeholders and community members to participate in pilot programs. We will manage these resources through a rigorous stakeholder analysis, which identifies the resources available (people, assets, intellectual property, technology and non-technology functions) and how they can be best deployed in the development of the projects.

Through our robust partnership network, we have identified qualified resources and partners for all aspects of the project. We will engage in open procurement processes to secure the best resources and best-in-class solutions, while maintaining the strongest attention to the key attributes of the projects: open data models, open technology frameworks and sustainable and transferable solutions. At the same time, we are not beholden to any one specific path or partner and can therefore pivot from one supplier to another if required.

6.2 SCOPE, SCHEDULE, SEQUENCING AND DEPENDENCIES

The scope of the three projects that comprise the SMP are detailed in the Vision and Technology chapters. Table 6.1 outlines the level of functionality that we plan to achieve and deliver by the end of each Stage Gate. The outputs delivered in the first Stage Gate are initially limited in functionality, as during Stage Gate 1 we will deliver a minimum viable product. We will take lessons learned from users and the co-design target groups to deliver new functionality and scale to more markets within later Stage Gates.

Concurrent with this work, we will also develop the guidance documents with best practice, templates, and materials to formalize our learnings and serve as a basis for knowledge transfer and scaling across Canada, as discussed in Chapter 2. Specifically, we will develop an MWI Toolkit, Co-design Toolkit, and MaaS Guidance. These will be delivered once key supporting project workstreams have been completed.

Table 6.1: Technology scope by Stage Gate

STAGE GATE	1	2	3
Project 1: Integrated MaaS	Co-design requirements (services and tools); build, beta test and Indigenous Smart Mobility Pilot.	Increase users; Increase functionality; Quarterly releases based on ongoing co-design and feedback; New mobility tools designed and delivered.	Consolidate learnings; Upgrade platform and service in line with emerging SMP co-design target group requirements. New features and markets
Project 2: Smart Trip Planning	Trip-planning microservice.	Integration with new third-party data to deliver new functionalities	
Project 2: Single Payment Platform	Integrated pricing information; payment microservice.	Payment microservice; MaaS stored account API; Payment for specific modes via one stored balance account.	Multiple-payment API; payments to multiple operators via a range of interface options.
Project 3: SSIIC	Integration with Stage Gate 1 data sources; API gateway; prototype open-data website with visualization tools	Integration with Stage Gate 2 data sources; open data website with visualization and analytics tools	Integration with Stage Gate 3 data sources; open-data website with visualization analytics, and simulation tools

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

We have partnered with BC Transit and CUTA to help disseminate information to municipalities and transit agencies across the province and Canada.

6.2.1 SCHEDULING AND CRITICAL PATH DEPENDENCIES

In our schedule (Figure 6.2), we identify the timelines for four Stage Gates. The first three Stage Gates are covered by the SCC funding. After Stage Gate 3, we plan for our solutions to be sustainable locally (through revenue generation) and scalable across Canada.

Our workplan strategy for MaaS is to rapidly begin co-design for the Indigenous Smart Mobility Pilot, working with Indigenous students to determine the needs and requirements for a MVP within the early sprints of Stage Gate 1. We will then deploy the service, learn and begin co-design of the MVP for our seniors co-design target group. At the same time, we will re-enter co-design and development on expanded set of features for Indigenous Smart Mobility Pilot. This process will then be repeated for the new employees co-design target group as well. We will be constantly refining the service offering and expanding to more users.

Similarly, the workplan strategy for the earlier sprints within Stage Gate 1 for the STP and the SSIIC will be to develop the microservices and integrate the data sources that support the delivery of the MaaS

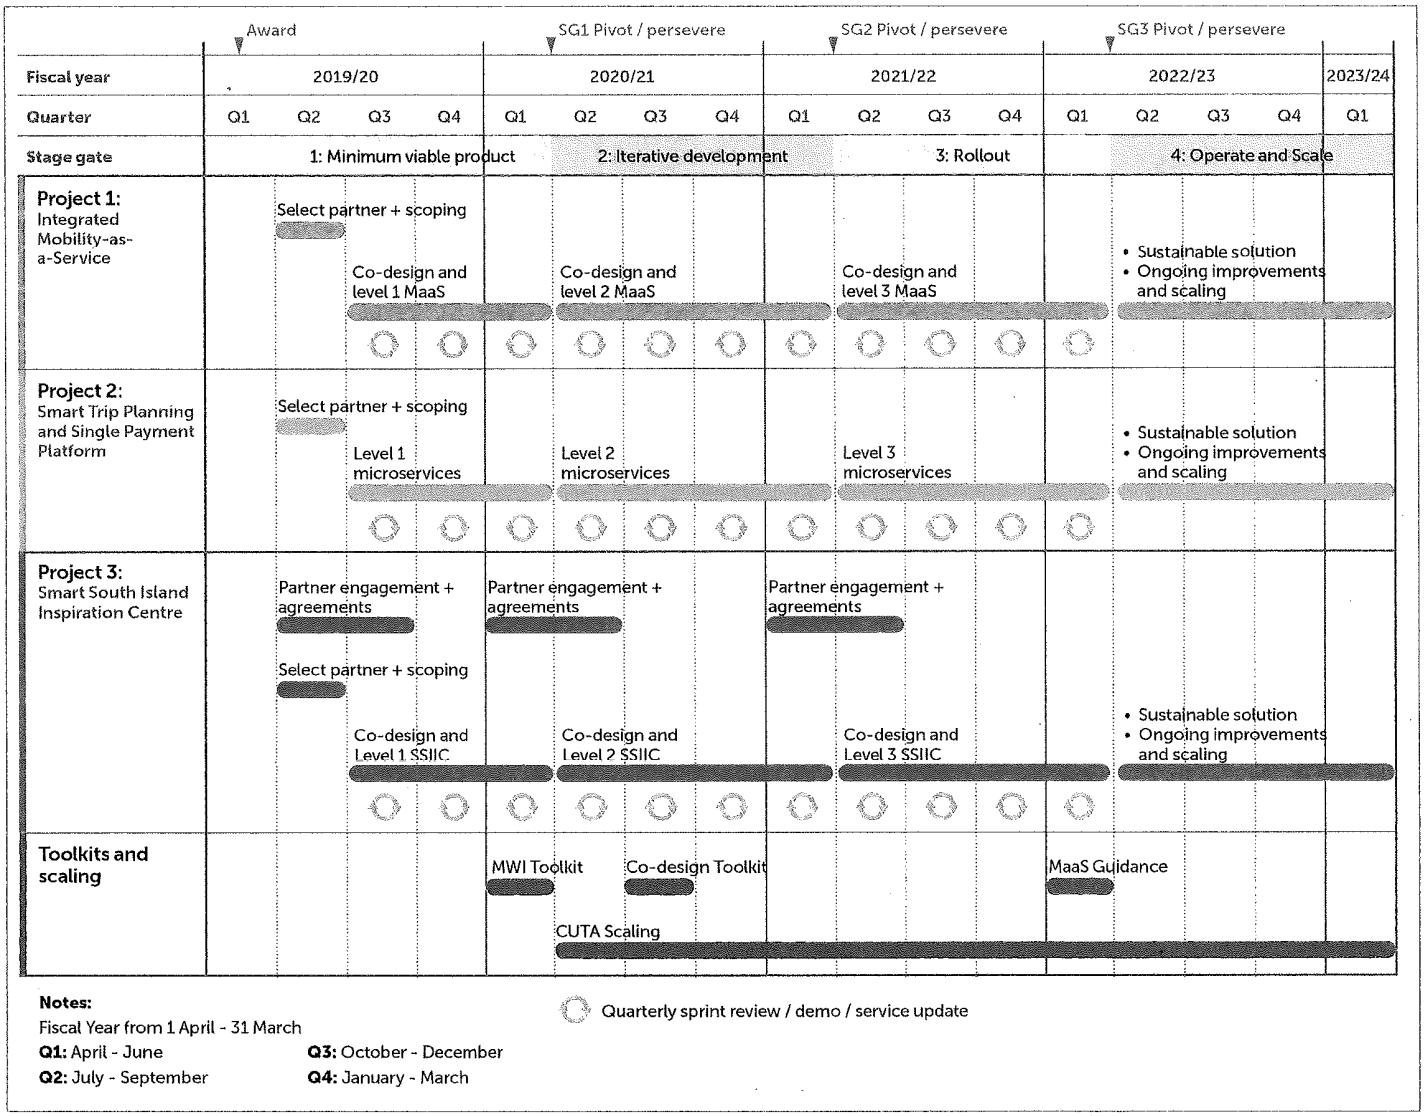

Figure 6.2: Project activity schedule

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 6.2: Critical path dependencies

Critical path activities for Projects 1, 2 and 3	Critical path dependencies between projects
• Stakeholder analysis and engagement • Scope definition • Project plan • Budget creation • *Co-design sessions* • Requirements gathering - Technology requirements - Functional requirements - Non-functional requirements • Functionality levels per sprint • Disaster and recovery plan	• Technology, functional, and non-functional requirements needed to be considered between all projects • Data elements/strategies required for personal data (between Projects 1 and 2) • Data elements/strategies required for transit, traffic and public data (between Projects 2 and 3) • Functionality levels for all projects per sprint and per pilot • Stage Gate deliverables that align functionality (between Projects 2 and 3)

services. Once these have been established, the buildout and delivery of the key components runs in parallel between the major projects, as shown in Figure 6.2.

With the scope defined for each project, the following critical path dependencies need to be considered by our PMO and product owners, as shown in Table 6.2.

Identifying and mitigating the impacts of schedule deviations are key determinants in a project's success or failure. Our development approach helps to drive innovation (since solutions are not prescribed) and provides transparency on progress for early decision-making based on tracked KPIs in our sprint reviews sessions. Adequate contingency planning from both delivery and budgetary perspectives at the outset is critical to minimizing the impacts of project plan slippage.

With this schedule and strategy, we will complete a regular stream of major public-facing deliverables (Stage Gate releases) that will be relevant to the public and to stakeholders and demonstrate progress on SCC outcomes (as captured by the MWI, detailed in Chapter 7).

6.3 RESOURCING

6.3.1 STAFFING

We have identified multiple groups and specific resources to comprise our core team (Table 6.3 and Figure 6.3). To deliver these skills, SIPP can draw on a wide range of organizations (regionally and globally) to complement its existing team structures.

Beyond the core team structure, SIPP will rely on its P3 governance model (Chapter 3). The P3 model is a critically important element of project management, as the project Steering Committee will be made up of members from diverse mobility stakeholders. Our governance is perhaps the most important factor in a successful delivery, as the most common reason for large system failures comes from lack of full buy-in and support from top-level stakeholders. SIPP's model is designed specifically for this purpose.

6.3.2 INFRASTRUCTURE READINESS

To support the quick start and delivery of the Indigenous Smart Mobility Pilot, we have begun identifying an inventory of assets (such as community vehicles), as well as travel information (including origin-destination, trip frequency) about the potential riders. This work has been started with our First Nations communities, groups, and education centres such as Songhees Nation, Sc'ianew Nation, Saanich Adult Education Centre, and W̱SÁNEĆ School Board, who have vehicle assets that are available for use within the Indigenous Smart Mobility Pilot. This demonstrates a major element of the projects' infrastructure readiness and contributes to the 'quick wins' element of our approach to project delivery.

Community engagement and collaboration was the key to bringing together and coordinating the sharing of assets amongst multiple First Nations communities and education facilities. This inclusive approach

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 6.3: Core team roles and responsibilities

ROLE	RESPONSIBILITIES
Program Director	• Reports to the CEO, ensuring that projects remain on track from a scheduling, resourcing, dependency, budgetary and functionality perspective
Technology and Development	• Manages the digital architecture including the technical requirements to deliver three projects • Coordinates the research and development roadmap and liaises with product owners
Data, Security and Privacy	• Engages with third-parties for data sharing and data access agreements • Responsible for compliance with the PIPA and handles all inquires relating to data privacy
Planning, Monitoring and Evaluation	• Measures performance and monitors our progress towards outcomes • Responsible for project controls and reporting
Community and User Engagement	• Coordinates and facilitates co-design sessions and user engagement to guide development of project • Provides customer support • Coordinates internal task forces and key stakeholder groups
Marketing and Communications	• Provides inbound marketing to project teams • Provides outbound marketing for the projects

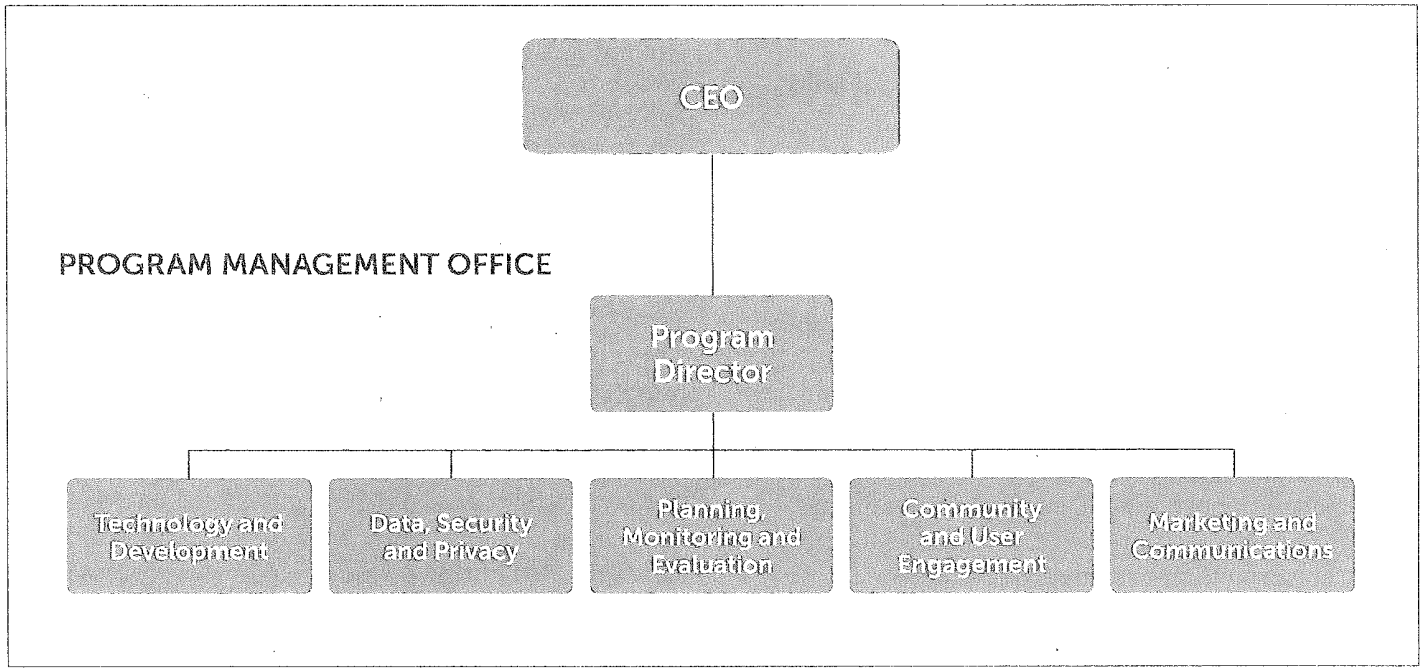

Figure 6.3: SMP project management

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

has never happened before for these groups and demonstrates that SIPP's P3 model can bridge the gap between the communities and their mobility needs.

Through our partnership with BC Transit, we have been able to secure driver training services. This is vital to the operation and success of the Indigenous Smart Mobility Pilot and provides employment opportunities and benefits to the communities involved, further demonstrating the positive impacts achievable through this pilot project (refer to Chapter 8 – Implementation for Community Employment Benefits).

As noted in the Chapter 2, the Indigenous Smart Mobility pilot will keep costs low by utilizing existing assets – both from a vehicle and people perspective. This approach ticks several boxes:

- Low cost;
- Low barrier to access and use the service;
- Employment opportunities; and
- Better transit services to those that need it most and is easily replicable and scalable.

Our research associated with the Indigenous MaaS pilot led us to the Preston model, which promotes community wealth building. This model mirrors our approach to the Indigenous MaaS pilot as it seeks to build a collaborative, inclusive, sustainable framework to support the local economies. This pilot can draw from lessons learned through the establishment of the Preston model by seeking to improve employment (through driver and operator employment opportunities), housing affordability (by improving transit options and reducing the need to live closer to high-cost areas). It also reduces reliance on public funding by reinvesting back into the communities.

With our partnerships, the projects will have access to key resources, including transportation planners and analysts at BC Transit, to assist with service and route planning, pickup/drop-off zones and schedule integration.

6.3.3 FINANCIAL

The financial management of the three projects is a key consideration not only for the grant funding but also to manage aligned funding contributions from our partners. Further to this, budget and financial management practices will be integrated into the PMO responsibilities to ensure strong attention to financial performance to plan throughout the project. Please refer to the Appendix 1 for further information.

6.4 STAKEHOLDERS

As we develop the concepts and teams for each project, we will conduct a stakeholder analysis to understand exactly what each key stakeholder's interests, expertise and investments are across the projects. This analysis will help to measure the success of each stage of the project to ensure that the work being conducted is meeting the needs of those stakeholders as well as the objectives of the projects and overall SMP. This can be achieved regularly through the quarterly sprint reviews and product demonstrations.

An early stakeholder analysis will help to inform where opportunities and gaps lie in our partnerships, further enhancing our goal to be nimble with our procurement policies. Please refer to Chapter 4 for more information.

6.5 PROCUREMENT PLAN

These projects naturally require the coordination of resources and oversight from many private and public organizations. Bringing these worlds together requires a P3 structure to be built and managed. SIPP has already developed and proven (and gained international recognition for) this model. Procurement will be open and transparent, using public procurement processes with a clear line of sight toward the main outcome statements of the projects. SIPP will not be beholden to one technology or technology provider. Rather, it will favour open technologies in all procurement activities, allowing for maximum flexibility and transferability in our solutions.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

6.5.1 PARTNER AND VENDOR SELECTION

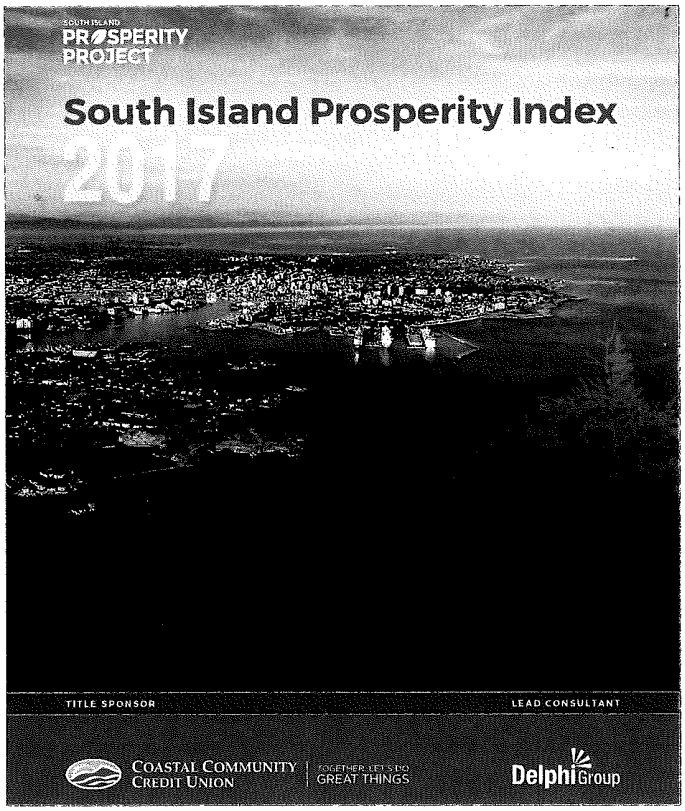
We plan to tap into the leading expertise, design and products that have already been developed and tested. This will allow us to develop quick wins and complement our Stage Gate delivery and agile approach for the three projects. Our structure as a private NFP supports this approach as it allows for innovative procurement approaches while maintaining openness and transparency.

To achieve this, we will use an adaptation of the industry standard IT Infrastructure Library (ITIL) framework in vendor solicitation. The framework, in brief, consists of having a clear view of outcomes, objectives and requirements; creating a requirement evaluation matrix; a market scan, and an evaluation of vendor offer against the requirements.

6.5.2 VENDOR ENGAGEMENT

Once a vendor is selected, we propose using an iterative engagement model. Traditional models assign large contracts and scope under a single static engagement where vendor performance measurement is difficult, and the contract is seen through to its conclusion, with no significant adaptations to changing conditions.

The iterative approach divides projects into distinct parts, with evaluation and feedback processes along the way, including progression of scope and budget approvals. By using this approach can also include an evolving scope framework, with detailed scope for early phases of the project and more indicative scope for later phases with leaner requirements. Iteration allows for better risk management and course correction based on real-time vendor delivery performance and aligns well with the Stage Gate process.



6.6 COMMUNICATIONS

Regular feedback between projects is a key component of the development process. It is not an adjunct function to be completed at the end of the cycle. By using techniques such as early beta trials and paper workflow prototypes and following customers in their daily journeys (surveys and feedback captured through the MWI), we will develop a growing understanding of our customers' mobility needs throughout the development process. While the main project advocate for the customer will be the Product Manager, it is expected that all project members will have an intimate knowledge of their customers.

Beyond the specifics of project communications, there will be a consistent strategic communications plan delivered to communities. This, coupled with the outputs of the SSIIC, will give the broader community a good sense of 'what is going on' with the program throughout development. Engagement activities already completed in advance of this finalist submission—including social media, innovation events, showcase events—will continue as well.

6.6.1 REPORTING STRATEGIES

Regular monthly reporting from the PMO to the Steering Committee will ensure traceability from both a deliverable and budgetary point of view. This level of reporting accountability helps to identify and mitigate unknown risks and keeps the key stakeholders engaged through the design and development stages.

Each year SIPP releases the South Island Prosperity Index, which measures the region's competitive position among the five themes.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

We will have quarterly reporting with our sprint reviews to describe activities carried out, lessons learned with end-user feedback and planned activities for the next quarter across all three projects to maintain the required alignment. Additionally, the MWI is designed to be a dynamic, public-facing tool that engages users in what's possible with a bolder, smart mobility future.

6.7 SUSTAINING PROJECTS BEYOND THE CHALLENGE

Beyond the lifecycle of the SCC, we will work to sustain projects over the long term. Our vision for the evolution of MaaS is to progressively expand to more user groups and wider geographies across Greater Victoria, as well as and supporting expansion across Canada with our learnings and products. Our intent for Projects 1 and 2 is to develop the service and business models that can create revenues streams directly related to the value added by the SMP (Appendix 1).

As discussed in Chapter 5, our approach to data and privacy means that we will establish a data trust to govern and sustain the SSIIC digital platform (Project 3). We see the SSIIC digital platform as the foundation for a civic data marketplace (beyond transportation data) that provides value for both government and private organizations. Our intent through the development of the SSIIC is to build institutional capacity and explore revenue models with the data trust to enable sustainable operation and, over time, become a physical, interactive mobility lab.

6.8 RISK MITIGATION

6.8.1 APPROACH TO RISK MANAGEMENT

There must be a systematic approach to risk management and mitigation assuming at least the following steps:

- Identify known risks and predict potential risks
- Assess and analyze the probability and impact
- Plan to action to mitigate and minimize the risk(s)
- Implement the plan to ensure the risk has minimal impact on the project
- Monitor, measure and control the risk

6.8.2 RISK MONITORING

Establishing a risk register will help to collect and organize the risks into categories to help with the management and mitigation processes. Categories will be defined in conjunction with the PMO, stakeholders and project teams but an early framework would include

- Customer and stakeholder alignment
- Project management (scope/time/cost/quality changes)
- Resources and team (skills, availability)
- Technology and system architectures
- Change management
- Financial (procurement, expenses, contribution management)
- User adoption and feedback
- Data privacy and security

Our strategy for managing these risks will align to our outcomes and KPI's to measure the impacts those risks may have, as well as targeted decision making to resolve them. Any new risks will be raised, reviewed and ranked as part of the quarterly sprint reviews and will roll up into the monthly reporting by the product owners to the PMO and Steering Committee. Any existing risks that have been previously identified and are on the risk register will require review and ranking as well as mitigation measures and plans to address.

Table 6.4 provides a high-level overview of project management related risk, while project or issue specific risks are identified in each chapter of this submission.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 6.4: Risk mitigation strategies

RISK	MITIGATION STRATEGIES
Lack of executive support or change strategy	Refer to Chapter 3
Lack of stakeholder or public engagement	Refer to Chapter 4
Technology risk	Refer to Chapter 2
Filling the required core project resources	Greater Victoria has a rich talent set for partnership project management and technical development. SIPP will draw on its member organizations for additional support if required.
Unforeseen technical/logistical risks identified late in the project	SIPP has a broad network of partners and subject matter experts to draw upon. If/as new issues arise, this network can be brought into the projects on an as-needed basis. Open architecture also increases the responsiveness to these risks by ensuring flexibility.
Lack of integration and coordination across projects	Our PMO structure and outcomes-based approach is specifically designed to mitigate this risk
Projects do not follow described schedules	Through Agile methodology, coupled with formalized Stage Gates connected to key outcomes, the projects will have strong, early notification of any possible slippages. Remediation actions will be developed and tracked by the PMO.
Requirements are insufficiently designed	Requirements definition is a critical element to any project's success. They must be clear, complete, unambiguous and well aligned to the strategy. The key to strong requirements is a robust design and governance model, and formalized requirements change management and approval process. While the process can be agile, it must be structured and clear. We will deploy formalized board of change and change management practices within our PMO
Delays in schedule as a result of procurement model	SIPP has begun the vendor engagement process and expects to finalize a detailed procurement policy and strategy ahead of the grant award so that we can rapidly transition into execution upon award.
Lack of continuity of program and pilots after grant funding ends.	We are designing our SMP to sustain it over the long term, including how the projects transition to sustainable service and business models and how the SSIIC develops into a physical space. SIPP's funders have expressed strongly that smart mobility is a key, long-term, region-wide priority.
The projects drift from the real customer needs	Customers will be integrated in the project through the rapid sprint cycles in the agile process starting with the co-design target groups. Feedback will ensure the customer is continually validating the project outputs.

CHAPTER 6 LINKAGES TO OUTCOME THEMES

Convenience

Travel information (origin-destination, trip frequency) about the potential riders improves convenient travel options

Affordability

The Preston model addresses housing affordability and reduces reliance on public funding

Using existing assets keeps costs down and obviates major initial investment required to kick-start the Pilot

Wellbeing

We will develop an MWI Toolkit, Co-design Toolkit, and MaaS guidelines to help measure wellbeing

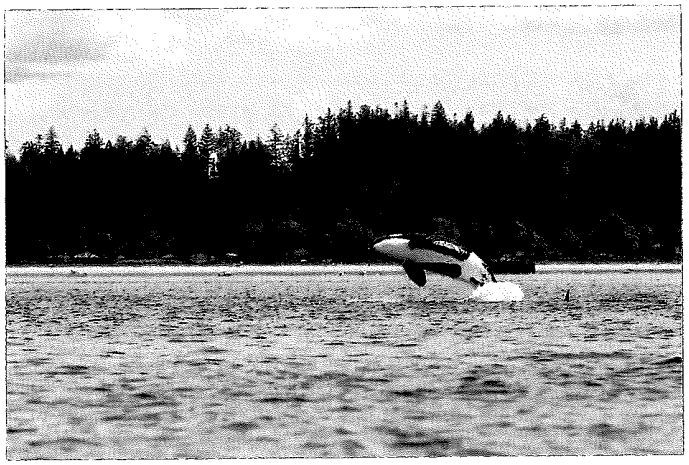
Inclusivity

Community engagement and collaboration was the key to bringing together and coordinating the sharing of assets amongst First Nations communities and education facilities to ensure inclusivity

Steering Committee will include diverse mobility stakeholders

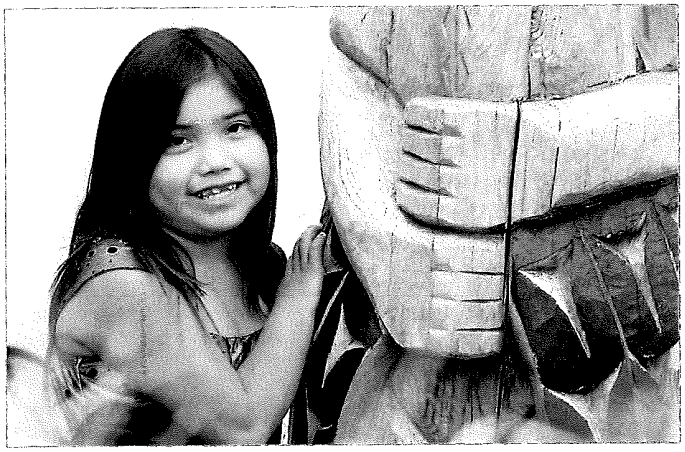
SAFe and Stage Gate approach ensures continual community/end user engagement

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information



CHAPTER 7
Performance Measurement

"Not everything that can be counted counts, and not everything that counts can be counted."
– Albert Einstein

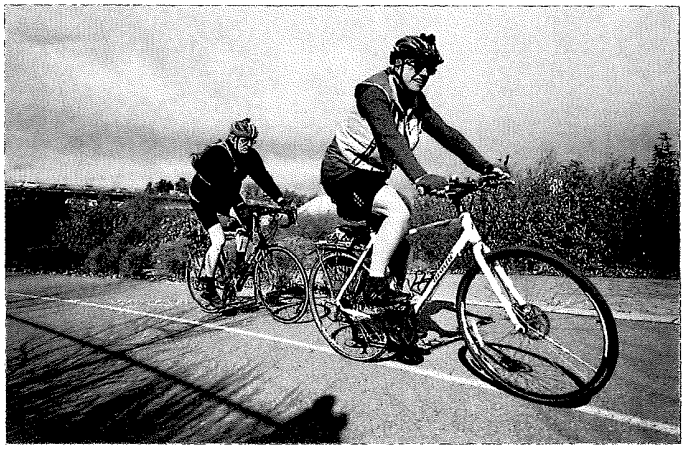


7.1 OUTCOMES-BASED PERFORMANCE MEASUREMENT FRAMEWORK

A well-defined performance measurement framework is vital to monitoring project operations and outcomes. It embeds a validated learning approach into our overarching SMP and projects. SIPP uses a results-based management approach, creating alignment from vision to our intended results, while expressing the explicit linkages among planning, evaluation and reporting processes. This chapter details our Mobility Wellness Index, described in the following section. We then discuss the specific outcome statements, indicators and a monitoring plan for each of these areas.

Our performance measurement framework maintains laser focus on the overarching challenge and outcomes statements, supported by project-level inputs, activities and outputs. The framework provides insights to key stakeholders on progress toward desired outcomes at select intervals, which offers critical data to support validated learning and decision making (such as incremental investments in successive product development cycles). It complements this with an engaging and visually compelling public-facing reporting dashboard: the Mobility Wellness Index.

To have a positive environmental impact, we will ensure that our multimodal transportation network is green.



Inclusivity is essential to ensuring that even the most vulnerable populations have reliable and convenient mobility options.

As outlined in Chapter 1, our challenge statement is "We will collaboratively create a multimodal transportation network that is convenient, green and affordable, boosting South Islanders' Mobility Wellness score by at least 20%."

We will measure our progress against this statement to achieve five key outcome themes, which we have identified through engagement with stakeholders and the public: convenience, affordability, wellbeing, green and inclusivity. Since our initial proposal, we have added 'inclusivity' as our fifth outcome statement. We have added this based on our community engagement, which revealed how transportation can be a challenge for low-income and other vulnerable residents. This additional outcome statement allows us to monitor the impacts of projects for these co-design target groups.

We outline our three-year outcomes-based performance measurement framework for the SMP in the following subsections. Full details will be published on our website (www.southislandprosperity.ca) on March 11, 2019. The report on the MWI will be available on our website March 16, 2019, and the more holistic South Island Prosperity Index (2018/19 edition) will be published on our website on April 30, 2019.

Cyclists ride on the Galloping Goose Trail.

7.1.1 MOBILITY WELLNESS INDEX

The Mobility Wellness Index (MWI) is the first performance measurement system designed to meaningfully measure the effects that mobility systems have on the physical, emotional and financial wellbeing of their users. The MWI is a composite score based on regional performance across 20 indicators. It is informed by 40 metrics derived from six theme areas – five of those themes are our outcome statement themes noted above, and an additional theme is Policy and Governance. Progress will be measured relative to the composite score, which will increase as a result of investments and improvements to mobility systems (in Greater Victoria's case: the Smart Mobility Program).

The MWI was developed over many months and iterations through SIPP's work with Arup, Happy City, a taskforce of city leaders, transit planners, psychologists and social health experts, and supported through stakeholder interviews and extensive international literature and program review. While Greater Victoria offers an ideal testing ground to pioneer this advance in transportation performance measurement, we already have MWI partnerships with the City of Montreal, Smart Columbus, CUTA, and others to ensure the design of the MWI can be scaled and replicated to other cities across Canada and the world.

The MWI composite combines different themes, indicators and metrics—including both quantitative and qualitative data—that indicate progress resulting from investments and improvements to mobility systems. The MWI is shown graphically as a polar diagram, as seen in Figure 7.1. This diagram offers three critical layers of information for monitoring our progress:

Themes are represented in the inner layer closest to the centre of the circle. There are six themes: one for each outcome statement, plus a sixth, labelled Policy and Governance (relating specifically to how governments are developing and implementing policies and programs that help improve wellbeing).

Indicators are associated with each theme on the outer layer of the diagram. There are 20 indicators, each forming a slice within the polar diagram. These are linked to specific goals and sub-themes listed under each outcome statement. For example, the Greener theme has resource efficiency, cleaner air, and citizen engagement indicators.

Metrics are the data that produces the score for each indicator (located as the middle layers of the circle). The score for each indicator is represented by a coloured location within each indicator slice. Indicators that are performing poorly will have a coloured location closer to the centre of the circle, whereas indicators that are performing well will have coloured location closer to the outer layer of the circle. These are measured either in quantitative or qualitative form and scored as averages to inform indicators.

Seniors need convenient, accessible and affordable transportation, both to meet daily needs and to mitigate the risk of isolation and loneliness. © CUTA

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The MWI (shown in Figure 7.1) will enable residents and decision-makers to quickly understand how the region is performing on specific indicators related to the challenge and outcome statements. The MWI will be directly tied to the data collected and analyzed at the SSIIC. Additional MWI tools, including assessment scorecards, will supplement the index to summarize how current the information is and to provide details on the scoring of each metric.

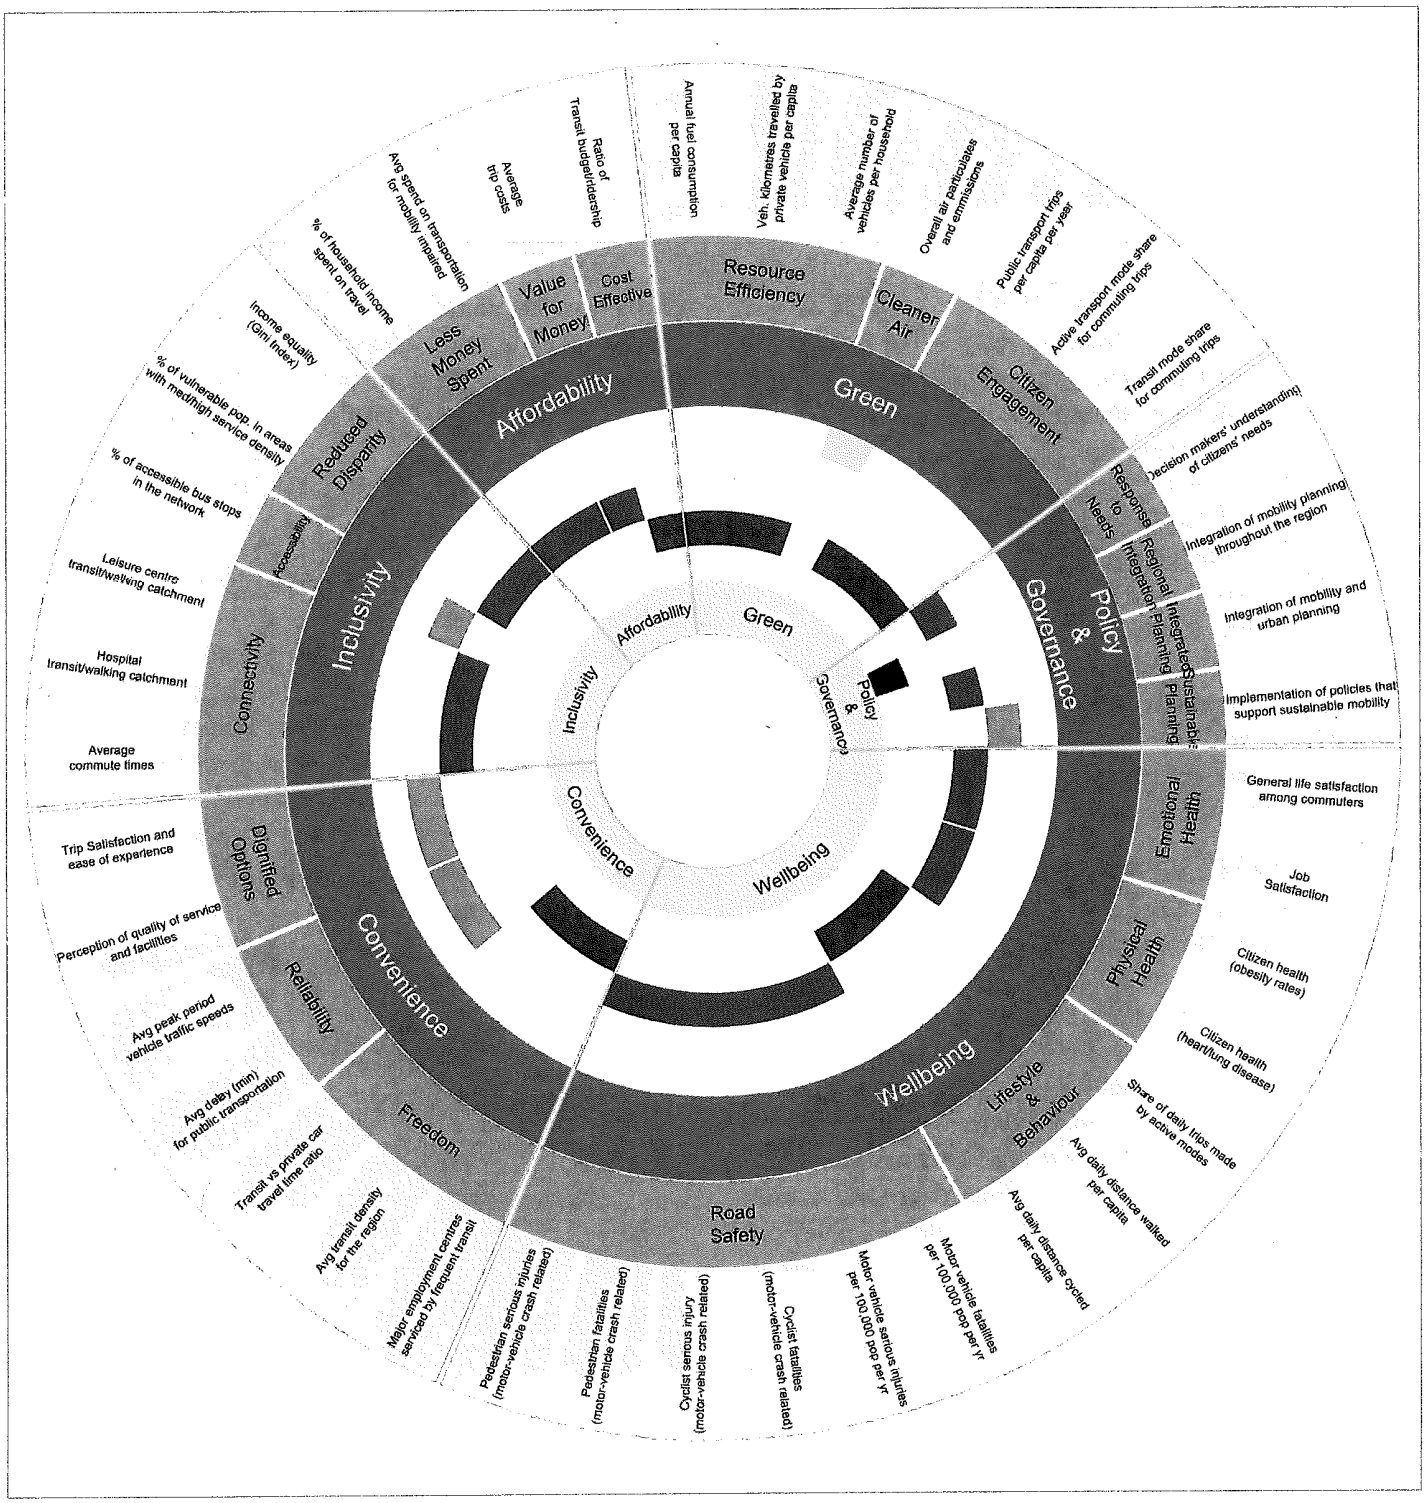

Figure 7.1: Mobility Wellness Index

7.1.2 LINKING ACTIVITIES, INPUTS AND OUTPUTS

Table 7.1 outlines key activities for all projects aligning with Figure 6.2. For each project, we have defined the activities, inputs and outputs that are delivered as part of the four Stage Gates. The key resources and partnerships necessary for success are listed for each activity as inputs. The table links the activities, inputs, and outputs. Each of these activities are intended to progress us towards our five outcome statements and to a sustainable solution beyond the smart cities grant. In Section 7.1.3, we discuss our monitoring and evaluation plan to measure our progress toward outcomes.

Table 7.1: Project activities, inputs and outputs

Stage Gate	Activities	Inputs	Outputs
Project 1 - Integrated Mobility as a Service (MaaS)'			
1	Select partner and scoping	• Resources: Community and User Engagement, Technology and Development, Data, Security and Privacy	• Detailed co-design strategy and technology development roadmap • Selected MaaS partner
1	Co-design and level 1 MaaS	• Resources: Community and User Engagement, Technology and Development • Key partners: MaaS partner, co-design and delivery partners • Indigenous Smart Mobility Pilot: vehicles, drivers	• Initial MaaS website/application tailored to three co-design target group requirements and integrated with MaaS microservices. • Prototype MaaS service in operation with trial co-design group • Identified potential revenue sources • Feedback from users and partners involved in trial
2	Co-design and level 2 MaaS	• Resources: Community and User Engagement, Technology and Development • Key partners: MaaS partner, co-design and delivery partners • Indigenous Smart Mobility Pilot: vehicles, drivers	• New users and feedback from co-design target groups across Greater Victoria • Revised prototype, tested potential revenue sources, and new functionality based on user feedback
3	Co-design and level 3 MaaS	• Resources: Community and User Engagement, Technology and Development • Key partners: MaaS partner, co-design and delivery partners • Indigenous Smart Mobility Pilot: vehicles, drivers	• New users and feedback from adjacent and new markets across Greater Victoria • Solution developed with established revenue source and new functionality added based on user feedback • Full MaaS solution scaled for use by adjacent and new markets in service
4	Sustainable solution – ongoing improvements and scaling	• Resource: Technology and Development • Key partners: MaaS partner, scaling partners (e.g. BC Transit, CUTA)	• Sustainable MaaS solution with revenue stream in service. With partners, learnings help to scale solutions across Canada and internationally
Project 2 - Smart Trip Planning and Single Payment Platform			
1	Select partner and scoping	• Resource: Technology and Development	• Detailed technology development roadmap • Selected MaaS partner (same as Project 1)
1	Level 1 microservices	• Resource: Technology and Development • Key partner: MaaS partner	• Platform connected to transport operator APIs (via SSIIC) that enables basic trip planning • Identified revenue sources for platform
2	Level 2 microservices	• Resource: Technology and Development • Key partner: MaaS partner	• Platform enables trip planning and booking (using transport operator systems) • Additional functionality as identified by three co-design groups • Tested revenue sources for platform
3	Level 3 microservices	• Resource: Technology and Development • Key partner: MaaS partner	• Platform enables full trip planning, booking and payment using a single account • Additional functionality as identified by adjacent and new markets • Established revenue sources for platform
4	Sustainable solution – ongoing improvements and scaling	• Resource: Technology and Development • Key partners: MaaS partner, CUTA	• Platform with revenue stream scaled for use across Greater Victoria, with lessons learned for Canada

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 7.1: Project activities, inputs and outputs (continued)

Stage Gate	Activities	Inputs	Outputs
Project 3 - Smart South Island Inspiration Centre (SSIIC)			
1	Engage Operators and develop data agreements	• Resource: Data, Security and Privacy • Key partners: transport operators, local municipalities	• Data sharing agreements and data licensing agreements with transport operators and open-data providers (e.g. local municipalities)
1	Select Partner + scoping	• Resources: Technology and Development, Data, Security and Privacy	• Specification with SSIIC digital architecture with technical, data, privacy and security requirements • Selected technology development partner
1	Co-design and Level 1 SSIIC	• Resources: Data, Security and Privacy, Technology and Development, Community and User Engagement • Key partners: technology partner, focus groups with data consumers • Data: Stage Gate 1 data requirements	• SSIIC digital platform – regional open data platform connected to transport operator APIs and open-data providers, and website/open data portal with visualization of spatial data layers on a map • Identify potential revenue sources
2	Engage Operators and develop data agreements	• Resource: Data, Security and Privacy • Key Partners: Stage Gate 2 data providers	• Data sharing agreements and data licensing agreements for Stage Gate 2 data.
2	Co-design and Level 2 SSIIC	• Resources: Data, Security and Privacy, Technology and Development, Community and User Engagement • Key partners: technology partner, focus groups with data consumers • Data: Stage Gate 2 Data requirements	• SSIIC Level 2 digital platform – Website/open data portal with visualization and mapping, plus analytics tools that reveal insights related to five outcomes • Tested potential revenue sources
3	Engage Operators and develop data agreements	• Resource: Data, Security and Privacy • Key partners: Stage Gate 3 data providers	• Data sharing agreements and data licensing agreements for Stage Gate 3 data
3	Co-design and Level 3 SSIIC	• Resources: Data, Security and Privacy, Technology and Development, Community and User Engagement • Key partners: technology partner, focus groups with data consumers • Data: Stage Gate 3 Data Requirements	• SSIIC Level 3 digital platform - Website/open data portal with visualization, mapping, and analytics tools, plus functionality to simulate/model impacts on outcomes • Established revenue sources for platform
4	Sustainable solution - ongoing improvements and scaling	• Resource: Data, Security and Privacy, Technology and Development • Key partners: technology partner, data providers • Data: New data sources as required	• Ongoing operation of SSIIC with sustainable revenue source; scaled to broader data sets beyond transportation • Lessons learned and best practices on the infrastructure, data governance, data privacy, and processes on the SSIIC model for data-driven civic engagement
Toolkits and scaling			
2	MWI Toolkit	• Resources: Planning, Monitoring and Evaluation, Data, Security and Privacy, Marketing and Communications • Key partners: partner municipalities (e.g. Montreal)	• Toolkit containing the indicators and methodology to calculate a Mobility Wellness Index in other cities and regions in Canada
2	Co-Design Toolkit	• Resources: Community and User Engagement, Marketing and Communications • Key partners: co-design facilitators	• Co-Design Toolkit with templates, materials, instructions to undertake a co-design process in a community
3	MaaS Guidance	• Resource: Technology and Development, Marketing and Communications • Key partner: MaaS partner	• Lessons learned, best practices, and guidelines on the infrastructure and process required to implement MaaS in a community
4	CUTA Scaling	• Resource: Marketing and Communications • Key partner: CUTA	• Published and shared by CUTA to municipalities and transit agencies across Canada

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

7.1.3 MONITORING AND EVALUATION PLAN

Grounded in the MWI, our monitoring and evaluation plan is designed around key performance indicators (KPIs) linked to our five outcome statements. Qualitative sources include self-reporting of trip satisfaction, perception of alternative modes, and subjective wellbeing assessment. Quantitative sources include average commute times, average trip costs, and the population within a travel time catchment of key destinations. As outlined in Chapters 2 and 5, these data sources will be integrated with others through Project 3 (SSIIC), which will provide visualizations and analytics on how both personal and community decisions on transport and mobility advance our outcome statements.

The following tables (Tables 7.2–7.6) outline our preliminary, intermediate and long-term outcomes for each outcome statement. For brevity, we have summarized our detailed logic model in the summary tables below for each outcome statement. The tables also reference the primary and alternate KPIs (associated with the MWI) that we will use to measure our progress towards achieving the challenge statement. The stated outcomes align with the timelines and deliverables within our Stage Gate approach, which is detailed in Chapter 6.

Table 7.2: Convenience outcome and KPIs

Outcome statement 1 (Convenience): With more convenient, accessible multimodal transportation options enabled by smart technology, the share of residents with access to convenient alternatives to single-occupancy vehicles will increase at least 20% by 2024.

Sub-themes: Connected, seamless, well-functioning, multiple options, integrated, faster, efficient, inclusive, accessible
KPIs: Perception of quality of service and facilities (transit, shared and active modes) (primary); average commute times, proportion of population within 400m of a fixed route transit stop
Data Sources (sample): CRD OD Survey; BC Transit Customer Satisfaction Survey; Subjective Wellbeing Assessment Toolkit; BC Transit routes/stops; Statistics Canada (census population)

Outcomes	Target	Monitoring period
Preliminary outcomes	Half of the participants in our co-design target groups with improved access to convenient alternatives to single-occupancy vehicles	Stage Gate 1
Intermediate outcomes	Two-thirds of participants in our co-design target groups with improved access to convenient alternatives to single-occupancy vehicles	Stage Gate 2
Long-term outcomes	Users of MaaS and the Trip Planning and Payment Application with access to convenient alternatives to single occupancy vehicles will increase by at least 20% (compared to baseline)	Stage Gate 3

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 7.3: Affordability outcome and KPIs

Outcome Statement 2 (Affordability): With improved multimodal transportation options and trip planning enabled by smart technology, area residents will spend, on average, less than 10% of their household incomes on transportation costs.

Sub-themes: Cost-effective, value for money, resource-efficient, less money spent on travel.
KPIs: Average trip costs (primary); percentage of household income spent on travel; average cost of vehicle ownership
Data Sources (sample): Calculation based on regional fuel costs, transit fares, and distances travelled; Statistics Canada (Household spending – Table: 11-10-022-01); ICBC

Outcomes	Target	Monitoring Period
Preliminary outcomes	Half of the participants in our co-design target groups will spend less on transportation compared to baseline (prior to participation)	Stage Gate 1
Intermediate outcomes	Two-thirds of the participants in our co-design target groups will spend less on transportation compared to baseline (prior to participation)	Stage Gate 2
Long-term outcomes	Users of MaaS and the Trip Planning and Payment Application will spend, on average, less than 10% of their annual household incomes on transportation	Stage Gate 3

Table 7.4: Wellbeing outcome and KPIs

Outcome Statement 3 (Wellbeing): With multimodal transportation options and planning enabled by smart technology, the number of daily trips made by active and healthy travel modes (i.e., walking, transit, cycling) will double by 2024 over the current baseline, and average levels of reported trip satisfaction in the region will rise 10%.

Sub-themes: Safer, healthier, less stressful commute, enjoyable commute, comfortable, improved social connectivity.
KPIs: Share of daily trips made by active modes (primary); trip satisfaction and ease of experience; citizen health; subjective wellbeing assessment
Data Sources (sample): CRD OD Survey; active tracking (smartphone or wearable); BC Ministry of Health; Subjective Wellbeing Survey

Outcomes	Target	Monitoring Period
Preliminary outcomes	Half of participants in our co-design target groups will report an increase in the number of active and healthy trips and an increase in trip satisfaction (from baseline)	Stage Gate 1
Intermediate outcomes	Two-thirds of participants in our co-design target groups will report an increase in the number of active and healthy trips and an increase in trip satisfaction (from baseline)	Stage Gate 2
Long-term outcomes	Users of MaaS and the Trip Planning and Payment Application will double their use of active and healthy travel modes over the current baseline, and average levels of reported trip satisfaction of these users will rise 10% (from baseline)	Stage Gate 3

Table 7.5: Green outcome and KPIs

Outcome Statement 4 (Green): Due to shifts in number of per-capita daily trips taken with personal automobiles towards daily trips per-capita taken with alternative travel modes, per-capita vehicle fuel consumption will decrease by 15% by 2024

Sub-themes: Lower carbon footprint, efficient mobility, MWI
KPIs: Annual fuel consumption per capita (primary); per-capita vehicle kilometres travelled by private vehicle; active transport/transit mode share
Data Sources (sample): Statistics Canada (The Canadian Vehicle Survey); CRD OD Survey; Data BC (GHG emissions measurements)

Outcomes	Target	Monitoring Period
Preliminary outcomes	One-third of participants in our co-design target groups will decrease their fuel consumption by 15%	Stage Gate 1
Intermediate outcomes	Half of participants in our co-design target groups will decrease their fuel consumption by 15%	Stage Gate 2
Long-term outcomes	Half of the users of MaaS and the Trip Planning and Payment Application report their vehicle fuel consumption has dropped by 15% (compared to baseline)	Stage Gate 3

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 7.6: Inclusivity outcome and KPIs

Outcome Statement 5 (Inclusivity): As a result of improved and more integrated multimodal transportation options and trip planning enabled by smart technology, 20% more low-income residents and/or marginalized residents will report improved access to their places of education, services and/or employment by 2024.

Sub-themes: Equity, diversity, fairness, participation in society, economic mobility, physical accessibility
KPIs: Population within 15, 30 and 60 minutes of nearest employment centre, education, hospital, or leisure centre by transit/walking (primary); proportion of vulnerable population within areas with medium to high transit density
Data Sources (sample): SIPP calculation based on BC Transit routes/stops data, local municipality location data, and Statistics Canada population data

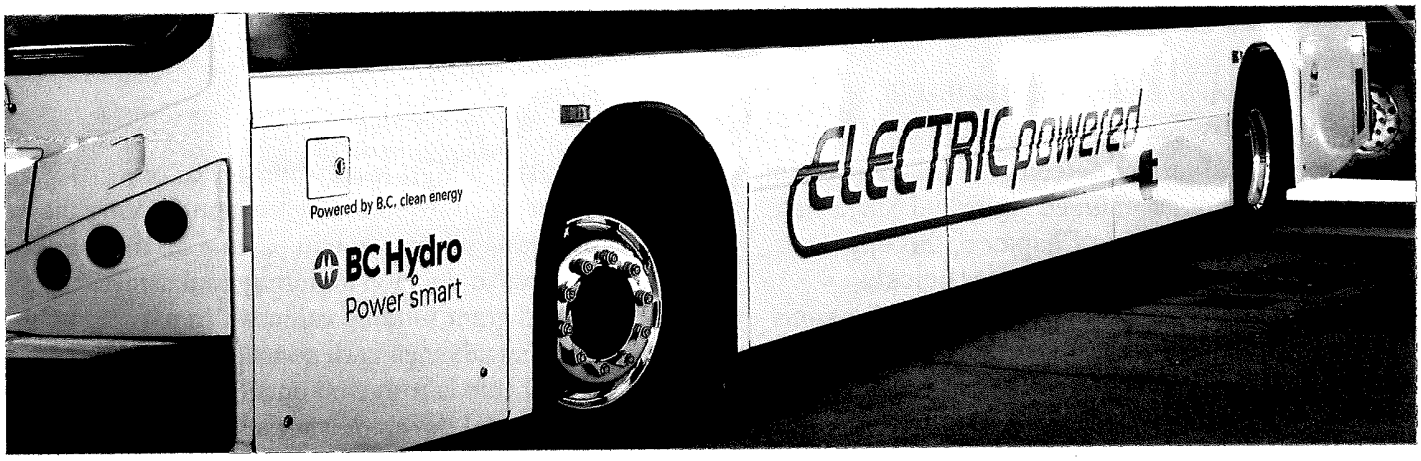
Outcomes	Target	Monitoring Period
Preliminary outcomes	Half of participants in our co-design target groups will report an increase in access to their places of education, services and/or employment	Stage Gate 1
Intermediate outcomes	Two-thirds of participants in our co-design target groups will report an increase in access to their places of education, services and/or employment (over baseline)	Stage Gate 2
Long-term outcomes	10% more low-income and/or marginalized residents will report improved access to their places of education, services and/or employment (from baseline)	Stage Gate 3

7.1.4 OUTCOMES-BASED CONTRIBUTION AGREEMENT

We propose to align our outcome-based contribution agreement with our combined Agile and Stage Gate approach. As described in Chapter 6, this approach focuses on providing initial services quickly, monitoring progress, and iterating based on lessons learned. In this way, we have planned multiple releases and deliverables within each Stage Gate to progress toward our outcomes.

Table 7.7 gives a high-level summary of our outcome-based contribution agreement. During the implementation phase, we will expand on the Stage Gate elements to develop a more granular feedback, check-in and grant funding calendar. In particular, we propose an advance cash contribution towards Stage Gate 1 that is triggered once we have selected our technological development partners. Within the Appendix, we outline our Financial Plan in which we discuss how we will manage the funding to effectively deliver the project outputs and outcomes.

Table 7.7: Summary of proposed outcomes-based contribution agreement



Stage Gate	Amount
Advance Contribution toward Stage Gate 1	$500,000
Stage Gate 1	$3,000,000
Stage Gate 2	$3,000,000
Stage Gate 3	$3,000,000
Final Report	$500,000
Total	$10,000,000

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

7.2 RISK MITIGATION

Table 7.8: Risk mitigation strategies

RISK	MITIGATION STRATEGIES
Inability to access third-party data sourced from external databases	We have ensured that our performance indicators can be measured using databases that are routinely updated and surveys that are regularly conducted (including eventually embedded into various user interfaces). We have also ensured that the data points on which we are relying come from reliable sources and surveys, identifying overlap between data sources for cross-referencing. Furthermore, in noting the collection and publication schedules for different data points, we strategically coordinated our performance measurement timelines according to the availability of data.
Changes to data sources used for baseline measurements	
Infrequency or lack of updates to data sources required for monitoring performance	
Data privacy/ownership	The MWI and the SSIIC will adhere to the high standards within the data management plan, described in Chapter 5.
Data are inconclusive on the progress towards outcomes	Through the SSIIC, we will consolidate a wide range of datasets to help derive new insights for an Outcome Statement. Should a high-level metric be inconclusive, we will have access to detailed datasets to undertake further analysis to explore the issue alongside partners and informants.
Data are expensive to collect	We have identified primary and alternate KPIs and data sources and will select the KPI and monitoring frequency that balances the insight and value for money.
Qualitative data may be affected by survey quality and sampling bias	We will confirm the source of the qualitative data and, through the co-design target groups, make sure that the questions are relevant and clear to respondents.

Electric buses contribute to a cleaner transit fleet.

CHAPTER 7 LINKAGES TO OUTCOME THEMES

Convenience
Many KPIs measure average commute times, proportion of population living near transit, and quality of transit service, facilities etc.

Affordability
Many KPIs measure average trip costs, percentage of household income spent on transportation etc.

Wellbeing
Many KPIs measure share of daily trips made by active modes, citizen health, subjective wellbeing assessment etc.

Green
Many KPIs measure annual fuel consumption and vehicle kilometres travelled per capita, mode share using active transport/ public transit etc.

Inclusivity
Many KPIs measure accessibility to jobs, education, healthcare, or leisure centre by transit/ walking, proportion of vulnerable population within areas with medium to high transit density etc.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

CHAPTER 8
Implementation Phase Requirements

8.1 REPORTING AND LEGAL REQUIREMENTS

This chapter outlines how we will be compliant with the relevant local, provincial, and federal regulations and requirements during the implementation phase and outlines the associated risks and mitigation strategies. The implementation phase requirements include a Duty to Consult with Indigenous groups, Modern Treaty Obligations, Community Employment Benefit and Climate Lens Assessment.

8.1.1 DUTY TO CONSULT WITH INDIGENOUS GROUPS

Across the region there are 10 First Nations communities: Tsartlip, Tsawout, Pauquachin, Tseycum, Malahat, Songhees, Esquimalt, T'Sou-ke, Sc'ianew (Beecher Bay), and Pacheedaht First Nations. Seven of these First Nations are active members of SIPP, ensuring we are well positioned to engage and consult with these communities.

The Duty to Consult with Indigenous groups is triggered when a planned action or initiative may result in an impact to a credible territorial claim, a Treaty or Constitutional right. Given that part of Project 1 (MaaS) is intended to serve Indigenous communities, this may trigger a Duty to Consult with Indigenous communities if an impact to a right or title is a possibility.

Beyond Duty to Consult, we know that engagement and building partnerships with Indigenous communities is paramount during all phases so that solutions meets community needs. During the finalist phase, we developed the project rationale and concept in collaboration with representatives from Songhees Nation and Sc'ianew Nation and W̱SÁNEĆ school board. As outlined in Chapter 4, we have learned about the needs of the students in these communities and understand how these communities can be partners in the delivery of the Indigenous Smart Mobility Pilot.

During the implementation phase, we commit to ongoing engagement and collaboration with Indigenous communities across the region. As detailed in Chapter 4, SIPP has a number of First Nation partnerships, and many initiatives have been developed specifically to be inclusive of First Nation communities. Further, as described in this proposal, Indigenous students will co-design our Indigenous Smart Mobility Pilot. Through this co-design process, we will better understand the transportation, mobility and accessibility challenges experienced by First Nations communities. We will continually seek their feedback and input during the technology development process. We will also continue to identify and cultivate partnerships with Indigenous communities related to the delivery of MaaS services.

SIPP leadership takes a collaborative approach and relies on First Nations partners to offer expertise on appropriate approaches and programs addressing First Nations needs. For the SMP, we commit to engaging and consulting with the First Nations communities in line with the guidance issued by the British Columbia Ministry of Indigenous Relations and Reconciliation: *Guide to Involving Proponents When Consulting First Nations*, which outlines the approach to consultation including preparation, engagement, accommodation, and decision and follow-up.

8.1.2 MODERN TREATY OBLIGATIONS

Five of the 10 First Nations in the region are currently negotiating modern treaties with the Crown through the BC Treaty Process. The T'Sou-ke, Sc'ianew, Songhees and Malahat First Nations are negotiating under the Te'Mexw Treaty Association and signed an Agreement-in-Principle in 2015. Negotiating separately with the Crown, Pacheedaht signed a Framework Agreement in 1997 and are aiming to sign an Agreement-in-Principle in 2019.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

At this time, there are no modern treaties implemented between the Crown and the First Nations in the region that will trigger an obligation for this application. However, as our partnering First Nations may reach final agreement in the next five years and become modern treaty Nations, SIPP recognizes the significance of this shift in self-governance.

SIPP is fully committed to supporting our partners as they establish self-governance, and we commit to fulfilling any associated obligations that are relevant to our projects.

8.1.3 COMMUNITY EMPLOYMENT BENEFITS

The Community Employment Benefits (CEB) is a reporting framework for projects that receive funding under the Investing in Canada Infrastructure Program. This reporting framework focuses on employment and/or procurement opportunities provided to at least three of the following groups: apprentices; Indigenous peoples; women; persons with disabilities; veterans; youth; recent immigrants; and small-sized, medium-sized and social enterprises.

SIPP has led considerable engagement with governments, stakeholders and community members to best understand regional transportation challenges. SIPP has identified three groups for employment opportunities, outlined below, based on their current needs and gaps related to transportation and mobility.

Indigenous peoples

We have selected Indigenous peoples not only because they are active members of SIPP, but also because First Nations communities face specific mobility barriers that prevent meaningful access to education and economic opportunities. In the near future many of our First Nations partners will be evolving into modern treaty Nations with self-governing rights. This historic change will create many new opportunities. Project 1 (MaaS) will produce Indigenous-owned employment opportunities through the development of the Indigenous Smart Mobility Pilot (for example, within this ownership structure, jobs such as administrators, coordinators, and drivers will be needed).

Persons with disabilities

Our projects will offer opportunities to hire persons with disabilities, including members of our region's rapidly growing senior population, perhaps as call centre representatives, to encourage peer-to-peer support.

Small-sized, medium-sized and social enterprises

As an economic development organization, our mandate is to advance sustainable and inclusive economic prosperity in the region. We have selected this group as critical to support and monitor, as our SMP can directly and indirectly generate growth in these enterprises. Technology development has direct influence in the selection and partnership of small-sized, medium-sized and social enterprises in the development of the SMP. This could be through a partnership with these enterprises derived from the Open Innovation Challenges. Furthermore, we could indirectly support higher employment through our SMP. As transport and mobility within Greater Victoria is made more convenient and affordable, the region will become a more attractive place for small, medium, and social enterprises to locate their businesses.

During implementation, we will track progress by monitoring and reporting on the number of people employed in these target groups. We will also document the value of contracts awarded to small-sized, medium-sized and social enterprises. We will then consolidate both values for submission in our annual report and financial statements, issued to Infrastructure Canada.

The SMP will create a range of employment opportunities in the region.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

8.1.4 CLIMATE LENS ASSESSMENT

A Climate Lens Assessment is required by Infrastructure Canada for the SCC if, over the three-year program timespan:

- The total eligible project costs are $10M or greater; and
- The project addresses climate change mitigation, adaptation or resilience or disaster mitigation.

While this project meets the first criteria, the core focus of the project is on improving transport and mobility and does not meet the second criteria. Therefore, a Climate Lens Assessment would not be required during our implementation phase.

8.1.5 PASSENGER TRANSPORTATION ACT

Compliance with the *Passenger Transportation Act* is critical for SIPP given its pertinence to the SMP. The *Passenger Transportation Act* in British Columbia requires individuals and companies operating commercial passenger vehicles to have a passenger transport license.

While SIPP is not in the business of operating transportation services, our SMP includes the development of technology to improve transportation convenience for residents. The inclusion of technology as a solution may enable the development of new transportation services or the entry of new transportation operators into the Greater Victoria market.

Therefore, we will ensure the transport operators that partner with SIPP are compliant with the provisions within the *Passenger Transportation Act*, as a condition of the partnership. We will require any personal transport operators exempt from the Act to provide evidence that they have the appropriate license and insurance to operate their vehicle. Furthermore, specific to Project 1 (MaaS), SIPP will cross-reference the *Community Care and Assisted Living Act* to ensure the project is in full alignment with special facilities where specialized mobility services are warranted.

8.2 RISK MITIGATION

Table 8.1: Risk mitigation strategies

RISK	MITIGATION STRATEGIES
Transport operators and providers that wish to send data may not have the appropriate licensing to operate a passenger vehicle in British Columbia.	As part of the Data Sharing Agreement and service agreement negotiations, transport operators and providers must demonstrate that they meet the licensing and insurance requirements as outlined in the *Passenger Transportation Act*.
Progression in BC Treaty negotiations with First Nations may change the obligations that are required during the implementation phase. Delays in consultations interfere with project delivery.	First Nations form part of our governance structure with board level oversight, which strengthens our ability to monitor treaty negotiation progress. We will engage and work closely with First Nations through co-design of the Projects to understand and accommodate the relevant needs of the communities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

8.3 FREEDOM TO MOVE: FROM VISION TO IMPLEMENTATION

SIPP's "Citizen-Inspired Transformation" for Greater Victoria kicked-off over two years ago with the development of Vision 2040, which directly informed our "freedom to move" Challenge Statement guiding this Smart City Challenge proposal. Our shared vision for a new mobility future is designed by and for our citizens, and offers an innovative blueprint for how our communities, provincially and nationally, can employ smart technology—and smart citizens—to create meaningful impacts to improving mobility in our region.

The vision, planning, approach and partnership engagements that SIPP continues to lead with regional leaders and stakeholders are ambitious and targeted. The progress made to date has required a substantial amount of hard work, dedication and inspiration and has carefully informed our Smart Mobility Program, which reflects the needs and wants of our residents. Our commitment to deliver truly transformative change through our SMP mobility improvements will be evidenced by swift, well-coordinated implementation and delivery, and through our co-design process with users.

Our performance measurement framework is vital to monitoring project operations and outcomes. It embeds a validated learning approach into our overarching Smart Mobility Program to measure the effects that mobility systems can have on the physical, emotional and financial wellbeing of their users, to deliver Canada's first Mobility Wellness Index.

Our governance framework, outlined in this proposal, ensures the SMP maintains its vision, goals and integrity. Our project management model and outcome-based feedback loop will provide the quick wins required to build momentum. This will be a key element to ensuring the design and development effort with respect to features, functionality and technology solutions are not only best in class and but also inclusive of the diverse needs of users. SIPP's policy framework for data privacy and security will be central to maintaining data integrity for the public and for our partners, whilst also providing guidelines to selecting the smart technologies and innovations we employ to deliver transformative change.

We are prepared. We are excited. We are ready to win. Together, with our citizens, our leaders and our partners, we will advance this shared vision for a smart mobility future into our near-term reality where everyone in Greater Victoria has the "freedom to move."

CHAPTER 8 LINKAGES TO OUTCOME THEMES

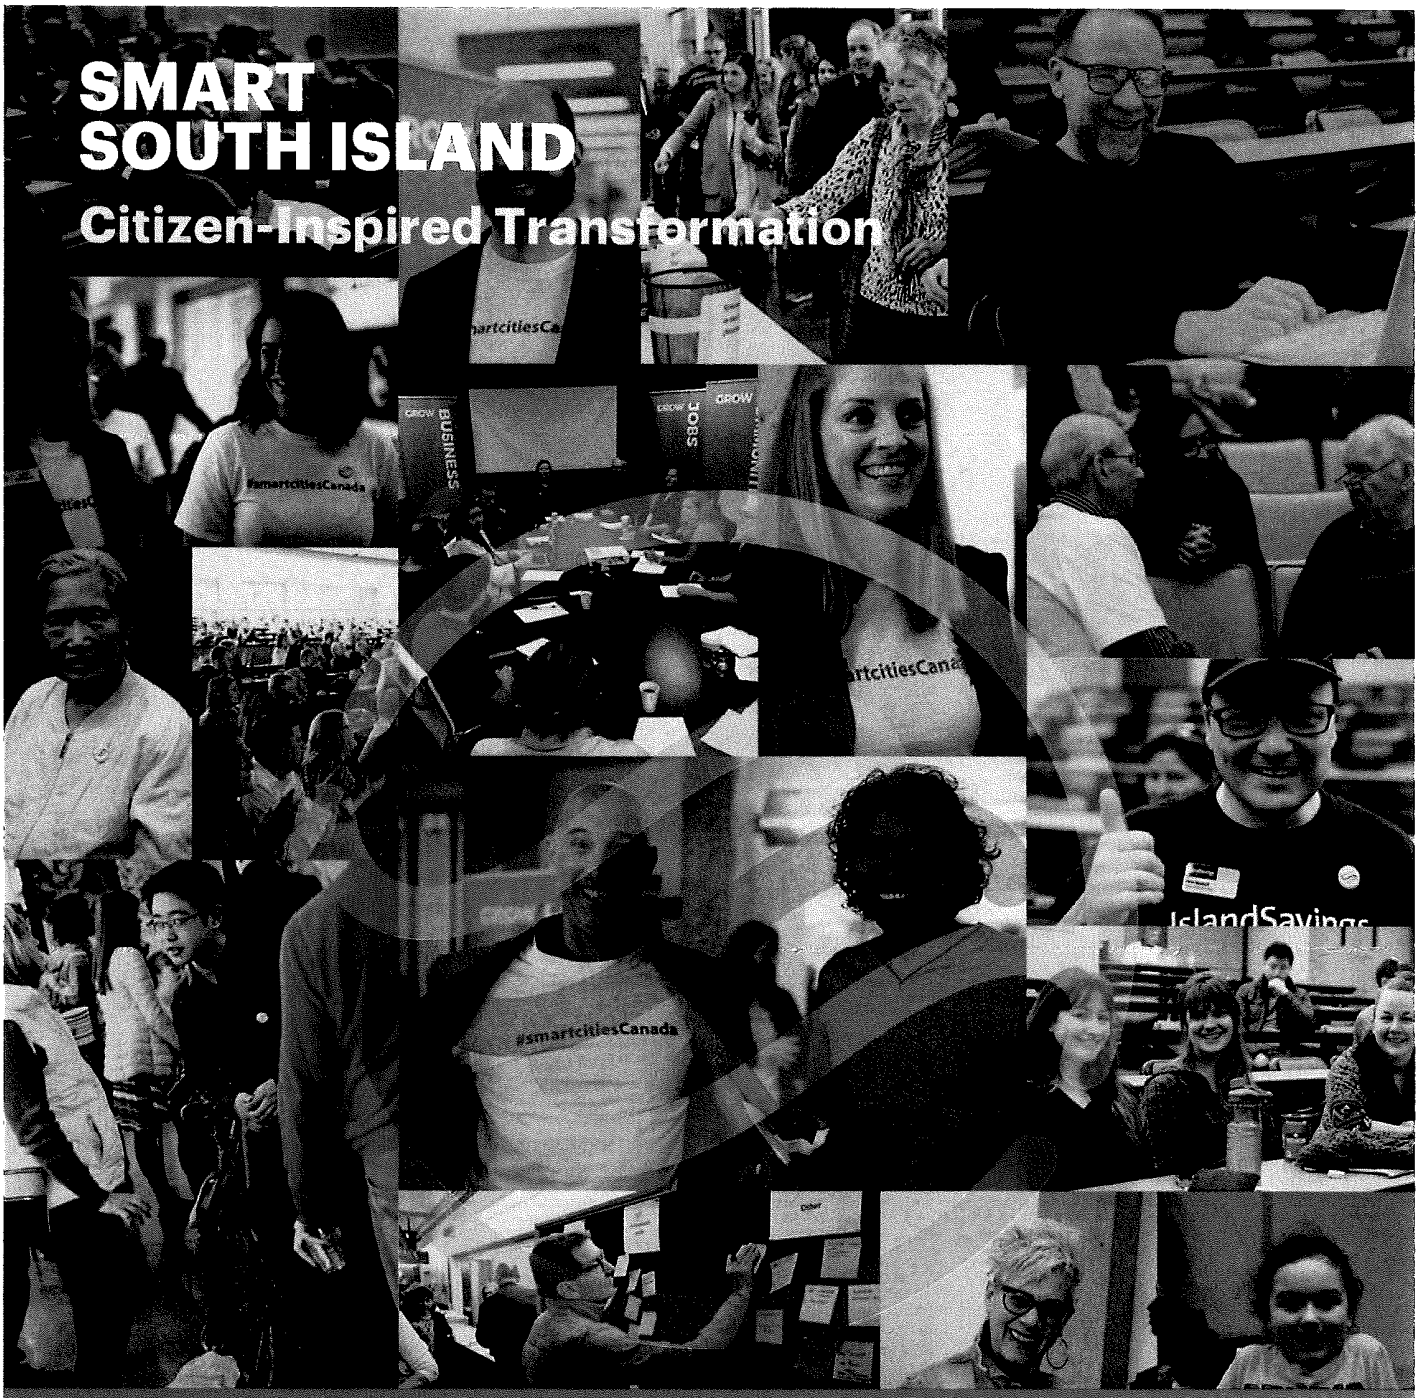
Convenience

Transport and mobility within Greater Victoria becomes more convenient

SMP includes the development of technology to improve convenience of transportation

Affordability

As transport and mobility within Greater Victoria is made more affordable, the region will become a more attractive place for small-sized, medium-sized and social enterprises to locate their businesses



Inclusivity

SIPP engaged 10 First Nations communities

CEB for Indigenous people and persons with disabilities

Partnership of small-sized, medium-sized and social enterprises will ensure the mandate of providing sustainable and inclusive economic prosperity in the region

I believe in Smart Mobility

I believe in
affordable, easy and convenient transit.

I believe in
putting Greater Victoria at the leading edge of transportation.

I believe
a shorter commute means more time doing what I love.

I believe in
transportation options for the entire region.

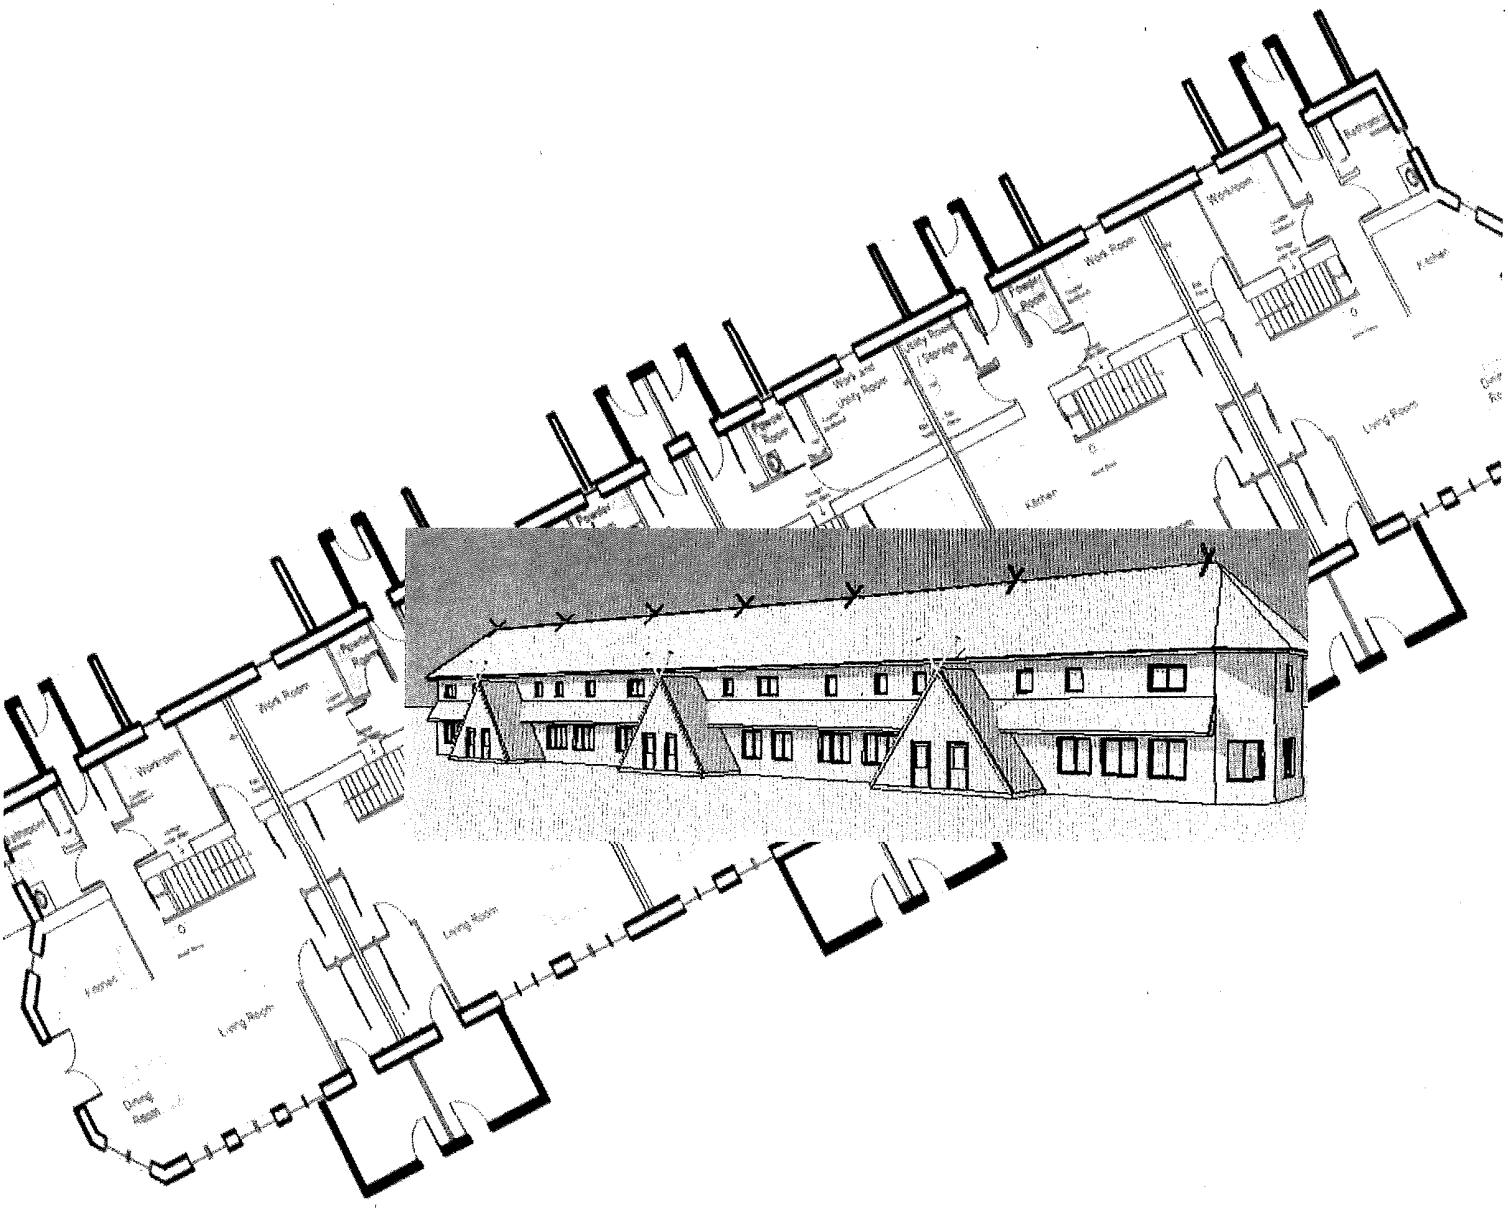
I believe in
bringing people, communities, and municipalities together.

I believe in
creating a better world for future generations.

I believe that
new technologies that will simplify our lives.

I believe in
ushering in a new era of transportation.

I believe in
the #FreedomToMove.



Help Greater Victoria win $10 million for transportation innovation in Canada's Smart Cities Challenge.

NET ZERO ENERGY HOUSING PROGRAM

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

EXECUTIVE SUMMARY

Improving Community well-being. This statement highlights the challenge that the CNE intends to overcome with its Net-Zero Energy Housing Program.

Housing is essential for a healthy community and, like many Indigenous communities, the CNE has a critical shortage of housing for its members. The lack of adequate housing in Indigenous communities results in overcrowding, a factor in many of the health and social issues inflicting our communities.

In fact, the quality of housing in Indigenous communities has been a hot topic in Canadian news for years, and even recently. The effects of mould and inadequate housing are being linked in the media to serious health conditions and even the deaths of Elders and children. It is clear that housing remains forefront and centre for Canadians, and especially for Indigenous communities.

Through its Net-Zero Energy (NZE) Housing Program, the CNE will construct quality, energy-efficient homes that are affordable for its members. The NZE Housing Program consists of new builds and retrofitting of existing homes. An inventory of single-family homes, an Accessible House and Multi-Client Six-Plexes (Six-Plex) will ensure that housing responds to members' needs and financial capacity.

The CNE vision is clear – create an affordable, resilient, energy-efficient housing program that offers rental and private homeownership opportunities. Substantial performance measurement activities will enable the CNE to determine the success of its NZE program and ensure that milestones and deliverables are on time and on budget.

By establishing an experienced and dedicated project management team, the CNE has been able to develop a comprehensive project implementation plan aimed at achieving success. The CNE will introduce smart technologies and net-zero building techniques to collect quantitative data on the net-zero performance of the houses built and retrofitted under its NZE program. In addition, the CNE will collect qualitative data on residents' housing experiences.

By having a strong, well-established governance system auditable to an ISO/IMS, the CNE will effectively manage program implementation to ensure outcomes are achieved through effective stakeholder engagement, strong leadership and risk-based thinking. The CNE governance framework is grounded in openness, transparency and accountability.

Throughout the development of its NZE program, the CNE has continuously engaged with stakeholders to lead to better decisions and ensure a holistic approach is taken in addressing the housing crisis in Eastmain.

Because of the nature of the NZE program, the CNE will ensure that personal information collected from its members is used, stored and disclosed in accordance with the Personal

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Information Protection and Electronic Data Act. Information collected under the NZE program monitoring and research activities will be anonymized prior to any disclosure.

The CNE undertook extensive costing exercises that has already yielded savings for our NZE program. The project management team aggressively sought funding, and will continue to do so, in order to supplement the SCC prize money to ensure the viability of the NZE program with minimum financial risk. The CNE has committed to matching the prize money if selected as the $5M category winner.

The aforementioned elements are aimed at bringing success and sustainability to the NZE program. Through collaborations with academia, industry experts and government agencies, the CNE is capable of offering not just housing to its members, but a better quality of life. Initiatives like training, work experience and economic development opportunities will ensure a strong and viable future for the community.

Our NZE program was designed around scalability, transferability and replicability. The smart technologies used are commercially available, the governance structure is easily transferable to other Indigenous communities and the house designs and building techniques can be scaled to reflect the financial and technical capacity of other communities, taking into consideration their culture and traditions.

The CNE is an Indigenous community and therefore benefits from obligations generally on the federal Crown and provinces with respect to the duty to consult and modern treaty obligations. At the same time, the CNE has ensured that its NZE program is inclusive and leads to a better quality of life for youth, women, elders and people with disabilities.

CHAPTER 1: VISION

The CNE Vision

The CNE is proud of its heritage. Its vision is that of a self-sufficient First Nation that is able to offer its members, and future generations, a better place to live and grow. This vision is confirmed in the CNE 2018-2021 strategic plan (See Annex A).

Our final proposal pursues the vision of improving the quality of life and well-being of our members and our community by establishing a Net-Zero Energy (NZE) Housing Program to respond to the critical housing shortage. Housing is inarguably the foundation of a strong, healthy community. The lack of adequate housing in Eastmain, and other Indigenous communities, is a significant factor in many of the health and social issues inflicting our communities.

Housing issues are rooted in the history of our communities. The Cree Nation of Eastmain's vision is therefore tied to its past.

Eastmain has evolved from its origins as the Hudson Bay trading post headquarters for the east coast of James Bay. In the early 18th century, the Cree people began to settle in the area and the community of Eastmain was established. In 1762, Eastmain was relocated to the south shore of the Eastmain River at the mouth of James Bay to make it more accessible. Notwithstanding the Crees' long occupation of the region and the community, it was only in 1962 that the Lands and Forests Act (RSQ c T-9) reserved the lands for the exclusive use of the Crees of Eastmain.

In the 1960s and 70s, the Crees of James Bay (Eeyou Istchee) joined forces to oppose Quebec's James Bay Hydroelectric Project. From this concerted effort came the first modern day treaty, the James Bay and Northern Quebec Agreement. Since then, the Crees of Eeyou Istchee have entered into a number of other treaties with Canada, Quebec and Hydro Quebec. Most recently, the Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada which gives the Cree significant powers of self-government.

Today, Eastmain has a population of approximately 850 people and is the headquarters of the Cree Regional Trappers Association. Much of the economy is based on local and regional government employment, but there are businesses operating in accommodation and food services, retail trade and construction.

Eastmain is therefore a thriving community with strong ties to its traditions.

Initially, like many Indigenous communities, the CNE housing program offered only social housing constructed with federal funding. Housing under this program must be modest and low-cost. However, the housing designs do not satisfy the cultural and social needs of the occupants and the construction techniques relied upon are often not well-suited to northern climates. Consequently, frequent maintenance is needed to ensure the housing units functionality at a cost that undermines their initial affordability.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The social housing model is no longer sustainable and does not allow the CNE to satisfy the ever-growing demand for housing. This model further fails to reflect the economic realities of Eastmain and other Indigenous communities where successful business endeavours, government employment and traditional lifestyles co-exist, creating different levels of financial capacity.

In an effort to move away from this model and find new solutions to the housing shortage, CNE is changing its housing program. By offering other solutions, such as private homeownership and rent-to-own, the CNE can ensure that social housing is allocated to those who have limited financial capacity. The success of these alternatives to social housing depend upon the CNE overcoming the challenge of creating affordable and sustainable housing options.

Consequently, the CNE developed the Net-Zero Energy (NZE) Housing Program. This program addressed the challenge of building affordable housing that is also affordable to operate. Cree Nation of Eastmain's NZE program aims to offer culturally-appropriate designs, significant reductions in operating costs and enhanced resilience and durability while building community capacity and creating new local employment and economic development opportunities.

Since first conceived, the CNENZE program has seen some changes as a result of our ongoing efforts to design a program that is responsive to the CNE housing needs while reflecting our capacity. As a result, the projects in year 1 will be carried out as pilot projects and will be limited to the construction of an Accessible House and the retrofit of an existing house. This variation was driven by (a) restrictions on bulk buying construction materials before storage is available, (b) the start date for local assembly of building components, and (c) to allow for a true inventorying and costing of construction materials required for the NZE program.

It is noteworthy that the NZE program not only responds to regional directives, it also supports the Government of Canada initiative to develop a "net-zero energy ready" building standard and a model code guiding energy efficiency improvements during renovations. Government of Canada intends to have these codes adopted by the provinces and territories by 2030[1]. The Cree Nation of Eastmain's NZE program will put it at the forefront of this initiative, making it an Indigenous leader in addressing the challenges of environmental sustainability and climate change.

Outcomes

Although housing is but one issue facing Indigenous communities like Eastmain, it is a common underlying factor of many of the social and health issues. Housing that is durable, appealing and comfortable is the foundation of a strong and healthy community which is the Cree Nation of Eastmain's long-term goal. Therefore, the outcome is to establish an inventory of energy-efficient, resilient housing to respond to the needs of its members and

[1] See: https://www.canada.ca/en/services/environment/weather/climatechange/climate-action/federal-actions-clean-growth-economy/homes-buildings.html

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

residents. The houses must be comfortable, reflective of the Cree lifestyle and able to withstand the northern climate.

Over the next 6 years, the first being a pilot year, the CNE plans to build 5 new single-family homes, 5 Six-Plexes and retrofit 25 existing homes. This initial inventory will offer private homeownership, rent-to-own and rental options, making housing accessible to everyone.

The NZE program is designed to encourage capacity building and a sense of community. By fostering a sense of pride in the community and Cree culture, our NZE program will become a model for Indigenous communities across Canada.

Reflects CNE's needs

The NZE program is reflective of the true needs of the CNE and its residents. The housing shortage facing Indigenous communities is undeniable and cannot be ignored.

Numerous studies have drawn attention to the enormity of housing issues in the North including the inadequate supply, poor quality construction, poor affordability and designs that address neither the rigorous climate of Canada's north nor the cultural realities of its Indigenous peoples. As noted by Andy Moorhouse, past President of the Kativik Municipal Housing Bureau, when speaking about the reality of remote northern Indigenous communities in a 2011 address, "Housing is not the only issue, but all issues relate to housing"[2].

In its report on "On-Reserve Housing and Infrastructure: Recommendations for Change", the Senate Committee on Housing highlighted "the need to examine current initiatives to addressing housing on reserve". Citing one example of the challenges, the committee noted that even though $300 million had been set aside by the federal government in 2008 for the First Nations Market Housing Fund, which was expected to result in 25,000 new home builds in 10 years, by May 2015 only 99 homes had been built. The Senate noted that new approaches to housing, including innovative designs, alternative programs and new methods of implementation are needed. Northern research has also identified that Euro-Canadian forms of housing are incompatible with the social structure of Indigenous families[3].

CNE's NZE housing program is relevant and responsive to the needs of Eastmain. As of February 2019, the CNE had a shortfall of over fifty housing units, with the demand for two-bedroom units accounting for more than 50% of the current needs.

Inuit studies equivalence - Northern application?

[2] If Not Now, When: Addressing the On-going Inuit Housing Crisis in Canada.
[3] *Examining the impact of Euro-Canadian architecture on Inuit families living in Arctic Canada*, Dr. Peter Dawson, University of Calgary, 2003

Table 1 – CNE Housing Needs: Past and Future

		Past 5 Years					
		2019	2018	2017	2016	2015	
Backlog per year		52	51	40	36	28	
		Projection over 6-year period*					
	Current	Year 1	Year 2	Year 3	Year 4	Year 5	Year 6
Housing Stock	255	256	263	270	277	284	290
New NZE Construction		1	7	7	7	7	6
Will reduce backlog to		51	44	37	30	23	17

*Note: It is expected that the housing needs will grow over the next few years as our younger generation ages.

As early as 2000, the Cree Naskapi Commission has emphasized the need to resolve the housing shortage and substandard housing in the Cree communities. Eastmain's NZE program is also in line with Government of Canada's national housing strategy which recognizes the housing crisis facing Indigenous communities and the need to develop new approaches that include increasing private homeownership opportunities, as well as the need to significantly improve the sustainability of housing in Indigenous communities.

Since 2017, the CNE has undertaken significant community engagement to ensure that its NZE housing program is meaningful for its members. In June 2017, the CNE held workshops, conducted home visits and consulted with members with a view to collecting information on house designs of different housing types. At the September 2017 annual general assembly, the CNE engaged in a broader discussion with its members for ideas on how to improve housing. These discussions have been complemented by consultations with service providers including health care and the fire department to ensure a comprehensive approach to addressing the housing shortage and ensuring a solution that is culturally-appropriate and reflective of the Cree way of life.

In addition, the CNE held its first Housing Forum in February 2018. The Housing Forum allowed CNE members to voice their views on the CNE housing needs and the Smart City Challenge proposal. The members contributed to the design of a culturally appropriate NZE multi-unit model home. The information and ideas obtained at the workshops, home visits and annual general assemblies led to the "Cree Café" where smaller focus groups have explored the issues and ideas generated during the broader consultative process. Through its Cree Cafés, the CNE has developed design innovations and established a means for ongoing community consultation on the NZE program.

In addition to high construction costs, the high cost of operation and maintenance remains a significant deterrent to home ownership and the development of home ownership programs in First Nations communities, including Eastmain. New home owners are often challenged to keep up with the high operating costs of their homes, while current social housing programs significantly subsidize operating costs. This deters potential buyers from investing into home ownership, remaining siloed into lifelong housing rental.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

power outages with risk of freezing

Adding to the ever-present concerns around housing shortages and affordability are the issues of energy efficiency, energy security and community resilience. Remote communities like Eastmain are subject to periodic power blackouts that can extend for days at a time. During power outages in Eastmain, most houses which were built to meet the "minimum" requirements of the building code, will freeze up within hours. Moreover, these same houses use considerably more energy than houses in southern Canadian cities, adding to the high cost of home operation while also contributing to climate change.

The Eastmain Cree are attached to their culture and regularly practice traditional activities. In fact, most families rely on hunting, fishing and trapping to supplement their diet. While in the bush practicing their traditional activities, the homes are unsupervised, making them vulnerable to the outcomes of power outages. The construction techniques and smart technologies proposed in the NZE program will significantly reduce these vulnerabilities.

Ambitious and Achievable

The proposal is not only ambitious, but it is realistically achievable. Less than 50 years ago, the CNE had no road access and very little infrastructure supporting its community. Today, Eastmain is a thriving community with an airport, arena, sports complex, schools, health clinic and stores. The CNE provides all the usual municipal services to its members.

The CNE currently has a need for 52 housing units that it cannot satisfy. In a community of 255 homes this is significant. The CNE plans to build 35 new housing units and retrofit 25 homes and buildings over the next six years. This amounts to improving the backlog by 67%. The scale of the proposed program is enormous considering the size and population of Eastmain.

The NZE program is ambitious in that it proposes to tackle a problem that is not simply local but extends to Indigenous communities across Canada. Housing is conceivably the biggest issue facing Indigenous communities which must deal with significant housing shortages and unsuitable construction materials and techniques.

In order to address the significant housing backlog, the CNE plans to implement its NZE housing program. The NZE program is designed to be sustainable because creating an affordable housing scheme doesn't only mean controlling the costs of construction, but also controlling the costs of operating and maintaining homes.

The Cree's connection to family and land are factors that must be at the forefront of any solution if the CNE initiative is to be successful and sustainable. By building new multi-family and single-family homes, and retrofit existing homes, the CNE will be able to offer its residents better quality housing options that respond to their needs and financial capacity.

The CNE has the structure and capacity to implement and achieve success of its NZE program. It has an economic development corporation, Wabannutao Eeyou Development Corporation, and a construction company, Stajune Construction Inc., that are often involved in local community construction projects. The CNE will use both companies with

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

a view to maximize local employment, entrepreneurship and housing affordability. It should be noted that Wabannutao Eeyou Development Corporation and Stajune Construction are in the process of restructuring to improve efficiencies for the implementation of our NZE program.

The CNE recognizes that the scope of its NZE program is such that it will need partners who can support and complement its efforts. The CNE carried out considerable consultation with community members and with experts in the areas pertaining to residential construction, construction standards and techniques and net-zero energy technologies.

The CNE identified potential partners because it recognizes that a program this ambitious cannot be undertaken alone. The CNE has established relationships with academia, businesses and government agencies and organizations to ensure the success of its NZE program. Where appropriate, the CNE has secured commitments from its partners and is developing formal agreements relating to the role that these partners will play in the program. These partners will all contribute to ensuring and measuring the success of the program.

In addition, the CNE has engaged with the supply chain. By sharing key information with suppliers, the CNE has been able to start tracking the actual costs of the NZE program. This is just the start of the Cree Nation of Eastmain's efforts to establish a resource management system aimed at enhancing accountability and responsibility.

The CNE has put significant effort and considered all its options to resolve the housing shortage and create better-built, energy-efficient homes. Creating an NZE community is therefore very ambitious but achievable.

Meaningful

The CNENZE program will realize outcomes that are meaningful for residents of Eastmain by constructing new NZE homes and retrofitting existing homes. The new homes will allow CNE members to enter the housing market at different economic levels while ensuring that members who rely on social housing are provided homes that can withstand the northern climate while offering a comfortable living environment.

CNE members have had a say in the NZE program though community consultation sessions and workshops at which they received information about NZE program and smart technologies. More importantly, our members played an important role in shaping the housing designs and the technologies that will be used in the NZE program, ensuring community-wide acceptance and approval.

The lack of adequate housing in Indigenous communities has resulted in overcrowding which is an important factor in many of the health and social issues affecting these communities. The current housing model and funding formulas in the on-reserve social housing program are not a sustainable solution to the housing shortage. These have resulted in the widespread use of housing designs that do not meet the cultural and social

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

needs of occupants and construction techniques and standards that are often not well-suited to northern climates.

Well-suited to Smart Cities Approach

The CNE NZE program is grounded in the past and forward-looking in proposing an achievable solution to the longstanding housing shortage, making it well suited to the Smart Cities approach. The CNE has a community wide fiber optic infrastructure, making it ideal for a Smart Cities approach to creating a connected, energy-efficient community.

[redacted]

Significant collaboration with experts, suppliers and key stakeholders has enabled the CNE to design its NZE program. Academic partners have jumped on board to undertake studies of measurable outcomes like energy savings and generation and less tangible outcomes like the comfort and happiness of occupants of NZE homes. Suppliers and government agencies consider the NZE program proposed by the CNE as creating new opportunities for development and capacity-building in the North.

The NZE program embodies the Smart Cities approach by employing smart technologies and connectivity to ensure open, transparent, accountable and responsible government. CNE is implementing a combination of ISO Standards to put in place processes and standards to better serve its members and increase transparency and accountability. These efforts include creating policies and First Nation laws that establish guidelines, a framework and rules in discrete areas, including housing. Given the importance of housing to community well-being, evolving societal views and the ever-changing technical landscape in this sector, the CNE intends to continue the revision of its Housing Policy, a process started at its Housing Forum, where members were given an opportunity to voice concerns and put forward ideas to improve community housing.

The smart technologies to be used in establishing NZE homes will ensure that traditional practices are supported in modern homes. Occupants or the CNE can monitor homes even while in the bush to ensure that the home systems are properly functioning.

The data generated through smart technologies will allow for better decision-making by the CNE and empower residents to better control energy use. This data will also enable the CNE to adjust its NZE program to be more responsive to the needs of its members. More importantly, such data may facilitate discussions with public energy agencies on energy use and with Canada Mortgage and Housing Corporation on housing designs and construction materials for northern climates.

The CNENZE program is transferrable to other communities facing housing issues and looking to create a more sustainable, resilient housing program. Not only can the NZE program be shared with other communities, it can be scaled to reflect the needs and capacities of these communities. Furthermore, our NZE program is particularly responsive even for off-grid communities as it will decrease the energy load on the diesel-generated electricity grids, thereby reducing significantly greenhouse gas emissions.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Measurable

The smart technologies to be used in the construction and retrofitting of homes will permit detailed data collection relating to energy use and production. The CNE will leverage this data to make better decisions and ensure the NZE program attains its objectives. The data will also be used by the CNE and its partners to make improvements to the NZE program and measure its success.

In addition to monitoring the NZE program, a social research platform will be established to assess, over time, how the program is contributing to community well-being. Housing conditions are a well-recognized determinant of health. We will evaluate how the NZE program fosters a sense of well-being by (a) reducing overcrowding through the construction of new homes, (b) improving comfort and livability by retrofitting existing homes, (c) designing houses that meet the cultural and social needs of occupants, and (d) by offering a range of housing tenure.

This social research platform will also serve to document the opportunities, challenges and best practices for scaling the NZE housing program to other Indigenous communities across the country.

Progress toward Outcomes

Since first submitting its proposal, the CNE has continued in its efforts to implement its NZE program.

The CNE has conducted community consultations and obtained community support for the NZE program. With input from members, the CNE has developed housing models that reflect and complement Cree culture in their layout and design.

The CNE has conducted modelling exercises to ensure that the NZE homes can achieve net-zero energy status. Through this process, the CNE has identified the building system, levels of insulation, the types of windows, the size of solar energy component and the other technical requirements needed to achieve net-zero energy in Eastmain.

Finally, the CNE has obtained funding from Canada Mortgage and Housing Corporation to develop and implement the social research platform in collaboration with the Canada Research Chair in Housing, Community and Health at McGill University in Montreal.

Why Choose Us

The CNENZE program is concrete, measurable and transferable. This means that it aligns perfectly with Canada's declaration that housing in Indigenous communities is a government priority.

While NZE projects may not be considered innovative generally, establishing an NZE program in the North is innovative. Moreover, implementing a community-wide NZE program that includes multi-unit residential buildings has never been contemplated – until now. Implementing the NZE program as an opportunity for capacity-building also sets the CNENZE program apart and makes it innovative.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

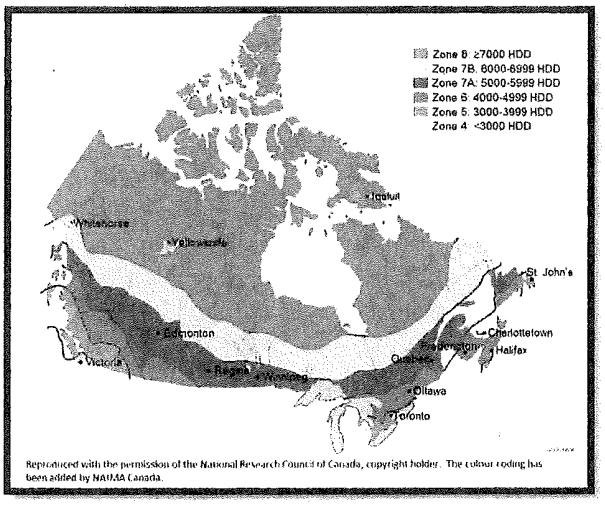
The CNE approach to the Indigenous community housing crisis makes our NZE program super-innovative. The CNE is addressing this holistically by bringing together community members, private sector actors, experts, public sector agencies and academia in order to find feasible solutions to creating affordable and resilient housing.

Much interest has been expressed in the CNE NZE program because it is aimed at a diverse clientele. Under our NZE program, the CNE is offering rental housing for low-income residents, rent-to-own and entry-level private homeownership. The designs give the CNE the flexibility of blending clientele for any combination in the Six-Plex and other housing options.

Unlike some proposals, the CNENZE program is relevant and responsive to the situation in many Indigenous communities across Canada. Creating an affordable, resilient housing program therefore also addresses a national problem, the critical housing shortage in Indigenous communities. The collection and analysis of pertinent data will allow the program to adapt accordingly to real quantifiable and qualifiable needs.

Our NZE program can be scaled to reflect the needs, financial constraints and capacities of other Indigenous communities across Canada. The program's scalability makes it easily transferable to other Indigenous and non-Indigenous communities as a solution to address housing shortages. Moreover, the program is designed to create economic development and capacity-building opportunities for Indigenous communities.

By designing a program that adheres to Smart City principles the CNE is setting the groundwork for a future of sustainable and durable housing for Indigenous communities that ensures openness, transparency and accountability at all levels. This means that members of these communities are involved in resolving the issues affecting their housing programs and informed of contracting and expenditures related to NZE homes.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 2: PERFORMANCE MEASUREMENT

Outcomes-based Performance Measurement Plan

Eastmain is located in Climate Zone 8 (Figure 1), the coldest climate zone in Canada.

Figure 1. Climate Zone Map

Its location and climate bring challenges to the CNE goal of creating a net-zero energy community. The collection and analysis of performance data relating to the NZE program is essential. Significant technical, social and costing data will be collected during the project. Technical data will be used to measure the performance of the homes constructed and retrofitted under the NZE program and will enable the CNE to identify shortcomings and take lessons-learned to make adjustments to the building systems and equipment accordingly. Social data will be used to measure the success and suitability of the designs selected for the NZE program and to make changes as may be needed to ensure the comfort and enjoyment of the occupants. Costing data will be used to first determine the actual itemized costs of construction and to build on efforts to reduce the cost of housing construction in Eastmain.

To address the wide range of housing issues in Eastmain, as part of the Smart Cities Challenge, the CNE will continue its transition from a social housing-based program to a market-based program. The primary criteria for determining housing types for construction will be financial capacity. This will also involve changing the underlying culture in Eastmain where social housing has been deeply inculcated.

The Eastmain NZE housing program is aimed at responding to the need for housing while inciting a shift in culture.

Links to Outcomes

The program will have three primary components: (a) the design and construction of a culturally-appropriate net-zero energy Six-Plexes, (b) the design and construction of a net-zero energy single-family homes, and (c) the net-zero energy retrofitting of existing homes in the community, all of which will be equipped with smart home technologies. These three components will constitute the "next generation" housing in Eastmain and will enhance social inclusiveness, by stimulating our local economy and safeguarding the health and environment of our community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Educating residents on the proper use and maintenance of housing will be a longer-term outcome of the CNE NZE program. Likewise, given the new housing policies and rules being implemented in Eeyou Istchee, the CNE must also find ways to inform suppliers and builders that wish to participate in residential construction in Eastmain of these policies and rules.

At the end of the NZE program, the CNE will have created a framework for the design, construction and operation of affordable, durable, comfortable and resilient net-zero energy houses in Northern communities.

Project Activities

Consultation

The CNE has carried out ongoing consultations on housing issues in the community through a range of initiatives including the Eastmain Annual General Assemblies, Cree Café's, design charrettes (integrated design workshops), site visits, meetings, the Eastmain Housing Forum and the Eastmain Builders Forum.

The first step to creating the NZE housing program involved engaging the community in the design of a culturally-appropriate NZE Six-Plex, consisting of 2 social housing units, 2 rent-to-own units, and 2 starter home ownership units. The CNE then consulted members on the design of an NZE single-family home prototype as a model for residents wishing to purchase their own home.

Through further consultation, that included the health and public safety sectors, the CNE designed other NZE housing prototypes to accommodate different needs, including a "Cree Elders House", an "Accessible House" and a starter house. Consultation with the health and public safety sectors also allowed the CNE to ensure that the designs and components of the Six-Plex, single-family homes and Accessible Houses provided a healthy, comfortable living environment that would also respond to the needs of the occupants.

The CNE also engaged with experienced net-energy zero builders who have worked on projects in northern communities. These builders, with other net-energy zero experts, brought a perspective and experience that enabled the CNE to establish the best building strategies, techniques and materials.

The amplitude of the CNENZE program and the goal of creating affordable housing called for engagement with local builders by the CNE and the Cree Nation Government. Local builders were given information on the NZE building concepts and program structures. More importantly, by engaging with the local builders, the CNE obtained their feedback on the proposed building systems and ensured that the building systems and technologies are feasible in Eastmain. This process has set a strong foundation for the integration of the NZE program, thereby ensuring its success in Eastmain.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Analysis

Much analysis and consideration went into defining the parameters of the CNENZE housing program to ensure that it was feasible and responsive to the realities of the North.

McGill University presented at the Eeyou Mitchuap forum on its Nunavik housing study. This study provides baseline information that has been useful in the preliminary analysis of housing requirements and models and will continue to be useful in testing the results of the CNENZE program.

The CNE consulted different experts on net-zero energy building systems, materials, technologies and construction strategies. Through extensive energy modelling on the Six-Plex and Accessible House the CNE was able to determine the level of energy production that would make net-zero energy feasible in Eastmain. The CNE has calculated the amount of energy production required, including the size of solar array and the capacity of air source heat pumps needed to attain net-zero energy. The CNE has thus determined, in its climate, the combination of energy saving construction techniques and materials (wall systems, insulation levels, windows, etc.) with energy producing technologies (solar photovoltaics, air source heat pump) to successfully achieve net-zero energy.

Analysis will include the activities conducted after implementation of the NZE program. The CNENZE program will include establishing a detailed costing regime that will ensure Smart Cites Challenge funds are used to deliver affordable net-zero energy houses and retrofits with smart technologies within the community. The costing regime will include an in-depth analysis of the transportation costs incurred to bring construction materials to Eastmain. This analysis will enable the CNE to determine the impact of transportation on the overall cost of housing in northern, remote communities like Eastmain.

Pre-NZE Activities

The CNE carried out an assessment of its existing housing inventory to determine the amount and type of renovations required to improve the functionality of these homes. This assessment will permit the CNE to identify the houses that will be best suited for retrofitting to make them function at the net-energy zero level.

Following significant community consultation which enabled the CNE to identify the floor plans and designs, it was time to decide on construction timelines. In order to ensure the program's success, the CNE has chosen to start with a single-family home that will allow it to test its processes and construction techniques. This choice was also driven by the necessity for an Accessible House in the community to respond to the needs of a disabled member. The CNE conducted extensive energy modelling on the Accessible House to ensure that it could satisfy the net-energy zero performance standards.

NZE Program Activities

In 2019, the CNE will construct one single-family Accessible House and carry out one retrofit of an existing home as part of a pilot project. This will also serve as a prototype for Eastmain residents with disabilities. The CNE will have the opportunity to test the construction materials and the building system used in projects before proceeding with the construction of additional single-family homes, multi-unit housing and retrofits.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

These initial construction projects will be used to develop a detailed and comprehensive list of all the materials required for each of the net-zero energy housing projects – the Six-Plex, single-family home and net-zero retrofit. The CNE will also create a detailed breakdown of projected labor costs for each stage of the construction process. Proper tracking and recording of the materials and labour required for each project will ensure that the NZE program is sustainable, affordable and transparent.

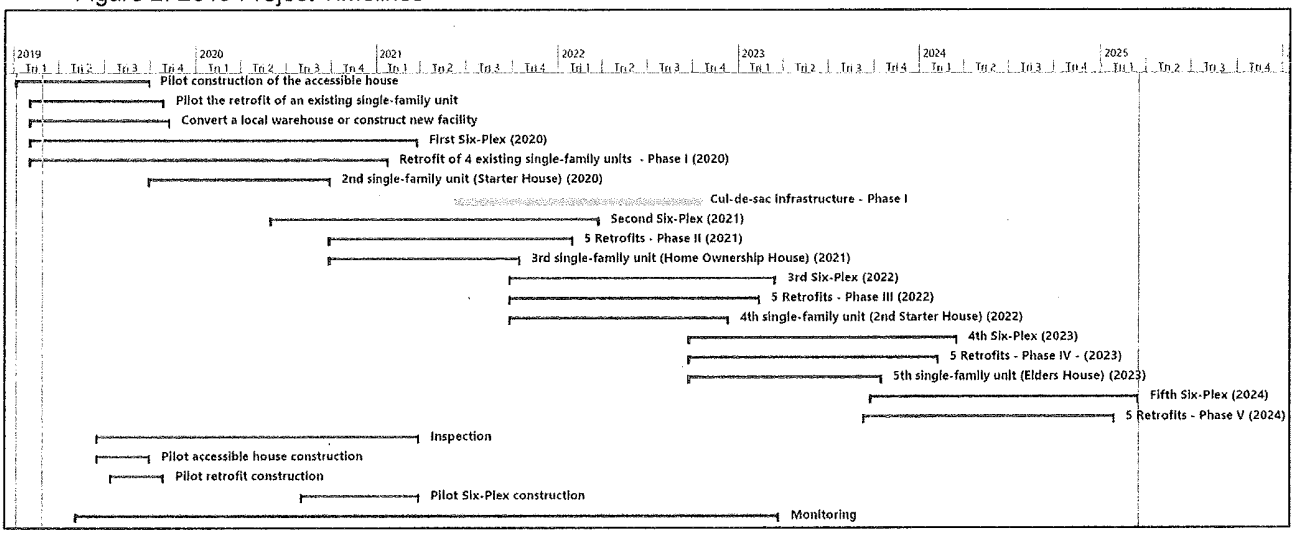
An in-depth post-construction evaluation will be carried out that includes a cost comparative analysis of the projected material and labor costs with those of the detailed costs that were tracked during the construction process. This evaluation and comparative analysis, combined with quantitative data obtained from Hydro-Quebec meters and the Concordia University study, will allow the CNE to make improvements aimed at ensuring the performance of the net-zero energy building system. Lessons learned from the construction of the Accessible House will be used and scaled to the Six-Plex. From its experience during the pilot project phase, the CNE will select the materials for the construction of the Six-Plex and future single-family homes.

The CNE has already identified transportation times as a significant factor in project delays and costs, especially in remote communities, as well as the inability to store enough construction materials on site to ensure continuity of work on projects. To address this issue, in 2019, the CNE will construct or rehabilitate a facility where construction materials can be stored and building components can be assembled. This is a significant change in how construction projects are usually managed in Eastmain where materials are purchased only when construction is to start, with delivery occurring much later, leading to work stoppage when supplies or materials run out as well as delays in starting construction. By having a storage facility on-site, the CNE can time its purchasing to get a better price on materials, buy in bulk, and be in a position to commence construction immediately. This approach will also permit the CNE to maintain and control an inventory, reduce wastage and prevent the deterioration of materials.

In 2020, the CNE will construct a single-family home and one Six-Plex. In addition, the CNE will retrofit four existing residential units. To retrofit existing homes to net-zero energy standards, the CNE will incorporate a super energy-efficient "wall panel system", in conjunction with construction techniques that will enhance the energy efficiency of foundations and roofs.

Keeping in mind the goal of building a strong community, the NZE program includes various opportunities for capacity-building and economic development.

Timelines and Deliverables



Our NZE program is a multi-year, multi-phase project during which the CNE will construct single-family homes and multi-unit buildings and retrofit existing homes. In year 1, 2019, the CNE will construct, as part of a pilot project, an NZE single-family Accessible House and retro one existing home. In the second year, the CNE will build one NZE Six-Plex and one single-family home and will carry out NZE retrofitting of four homes. In 2021, and for

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

all the subsequent years, the CNE plans to construct one Six-Plex and one single-family home, except in the last year, and carry out 5 retrofits following the 2020 schedule.

The below tables set out the timelines for the NZE program.

Figure 2. 2019 Project Timelines

Payment Schedule

The CNE has based the payment schedule on the above timelines. The payment schedule is intended to reflect the amounts needed to successfully complete the activities within the established timelines.

Payment Schedule

With these and the projected construction costs, training costs and other related costs, the CNE has established the following payment schedule for the Smart Cities Challenge prize money that is reasonable and rational.

Table 2 – Payment Schedule

Year Ended	Year Ended	Year Ended	Year Ended	Year Ended	Year Ended	Total
31-Mar-20	31-Mar-21	31-Mar-22	31-Mar-23	31-Mar-24	31-Mar-25	
Proforma	Proforma	Proforma	Proforma	Proforma	Proforma	
$517,285	$1,160,551	$1,225,331	$1,063,633	$1,033,200	-	**$5,000,000**

Quantitative and Qualitative Indicators

The CNE has established a collaborative relationship with Concordia University and McGill University for the purpose of permitting the collection and analysis of quantitative

academic partners
- data
- analysis
- results

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

and qualitative data. This data, which will allow us to measure the success of the NZE program, includes

- air quality
- thermal comfort through
  - objective measurements on energy efficiency
  - resident's self-reported assessments of thermal comfort
- energy consumption
- energy production
- Potential moisture issues in building components
- decay heat loss
- energy use trends
- well-being, based on indicators like
  - satisfaction with new home designs and retrofitted homes
  - thermal comfort
  - sense of home
  - quality of life
  - social inclusion, including socioeconomic indicators

Quantitative Data Measurement

The technologies to be implemented in this project are innovative and new to the region. The performance data to be collected is invaluable to validate their (a) application and (b) long-term performance, and to (c) improve the design, construction and operation of net-zero energy homes in northern regions.

Field data to be collected will be used to determine the (a) actual net-zero energy status of the homes, and (b) understand occupants' interaction with and operation of net-zero energy homes (like the set-points of indoor temperature, operation of HRV and air source heat pumps, window use, etc.). This data on indoor environmental quality will also be used in the qualitative study to assess the well-being of occupants with respect to the physical environment.

Qualitative Data Measurement

McGill University will conduct surveys and group meetings and attend Cree Cafés to collect information relating to occupants' experience in net-zero energy homes and retrofitted homes. The data will measure, amongst others, the (a) level of satisfaction with home designs and layouts, (b) operational functions, (c) compatibility with Cree culture and (d) pride in ownership.

Energy Modelling

The CNE will carry out detailed comprehensive energy modelling of the single-family home, the Six-Plex and the net-zero energy retrofits using Integrated Environmental

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Solutions (IES) or Energy Plus systems and drawing upon the lessons-learned during the construction of the Accessible House. The energy modelling will consider the effects of (a) night-time free cooling, (b) crawl space thermal mass and (b) shading to eliminate or reduce the use of air-conditioning, and provide recommendations aimed at improving the resiliency of the net-zero energy homes constructed in Eastmain.

The activities carried out during the comprehensive energy-modelling will include

- energy modelling based on the actual designs
- comparison of the energy-modelling results to HOT2000 software results
- optimization of the passive design and integration of the proposed technologies
- calibration of the comprehensive energy modelling with the field monitoring data collected on the Accessible House to optimize the design and construction of NZE homes
- hygrothermal modelling using the software WUFI Pro, calibrated with field measurements, that will be used to design alternative moisture-resistant envelope assemblies for net-zero energy homes in other climatic regions.

Monitoring, Reporting and Evaluation

Monitoring

The CNE and its partners, Concordia University and McGill University, will carry out various monitoring activities that will enable them to ascertain the success of the NZE program.

The sensors installed in the homes will collect important data that will be communicated through the battery operated dataloggers to a web-connected computer managed by the Cree Nation of Eastmain's Housing Department. The data will then be anonymized before uploading to an analytical website where it can be analysed by Concordia University. In addition, Concordia University will conduct quantitative studies on the air quality and energy consumption of a sampling of each of the housing prototypes constructed under the NZE program and the net-zero energy retrofit homes.

McGill University will analyse occupants' experience in the NZE homes and retrofitted homes. The well-being of the occupants will be measured and monitored over time using a range of indicators as described in the previous section. Data will be collected each year, using survey questionnaires administered to all Eastmain residents. This process will allow McGill University to monitor any change in the sense of well-being over time for Eastmain residents who move into NZE homes or whose homes are retrofitted and compare this to those residents whose housing situation does not change.

Given that smart meters have been installed on most homes, the CNE will seek to obtain quantitative information from Hydro-Québec respecting the energy consumption of each home. Using baseline data on non-NZE homes, the CNE will be able to determine if the NZE program is achieving its objectives and measure this achievement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Controlling the costs and timelines for constructing NZE homes requires consistent monitoring. As part of its NZE program, the CNE will establish a supply management system. This system will enable better monitoring and control of construction materials and their costs, including the transportation costs, as well as ensuring timely ordering to avoid delays.

Field Monitoring

Field monitoring will enable the CNE to identify any deficiencies in the program and ensure that the lessons learned through monitoring are applied to the NZE program. This will ensure that the NZE program is constantly adapting and improving to correct those deficiencies identified, if any, and responding to the needs of the community.

The monitoring protocol developed in year one of the NZE program will be applied to the construction and retrofitting projects in subsequent years. In year one, the Accessible House, scheduled to be completed by September 2019, will be monitored. The data collected through monitoring will be used to validate the design and construction techniques used, correct any issues, and incorporate design alterations to make improvements to the building's performance. For housing projects constructed in subsequent years, a similar data collection plan would be implemented for performance comparisons. Field monitoring will include:

- hygrothermal performance of the building envelope to ensure durability
- indoor environmental quality including
  - indoor air quality
  - thermal conditions
- energy performance including end energy use of
  - HVAC equipment
  - lighting
  - appliances
  - any other equipment
- energy generation of photovoltaic array

Concordia University will visit Eastmain twice during each construction season. The first visit will take place after the framing and roofing have been completed to install sensors and dataloggers, conduct blower door tests and seal any openings in the building envelope. Once construction is substantially completed, Concordia University will return to Eastmain to install energy monitoring equipment on the different systems, ensure the proper functioning of the sensors previously installed and conduct a second blower door test.

Hygrothermal Performance

The hygrothermal conditions, including the relative humidity and temperature (RH/T), of the envelope assemblies such as the walls, roof, attic and crawl space will be monitored. This data will be used to assess the risk of moisture-damage arising from condensation,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

decay and mould growth. An on-site weather station will be installed to monitor the wind speed, wind direction, rainfall intensity and global solar radiation. The weather station data will be used to correlate the hygrothermal performance and energy consumption and production of the NZE homes with local weather data for field data analysis and model validation.

Indoor thermal conditions and CO_2

RH/T and CO_2 sensors will be installed in indoor spaces to monitor thermal conditions and indoor air quality, thus enabling the CNE to confirm that indoor air quality standards are being met in the NZE homes and retrofits. This information will also be used to assess performance of the HRV system and determine if it is delivering sufficient ventilation to the housing units. Indoor RH conditions when combined with temperature data, will be used to assess thermal comfort. The RH data will also be used to determine the moisture loads for hygrothermal modeling to evaluate the resiliency of the NZE homes.

Energy Monitoring

Understanding and evaluating energy use and production in NZE homes is paramount to successfully achieving high performance and annual net-zero energy use. Both energy consumption and production patterns will be monitored. Monitoring will measure

- energy consumed by discrete building systems will be monitored, including
  - the air source heat pump and ducted mini-split (Heating)
  - ventilation fans
- appliances, including
  - stove
  - dishwasher
  - washer
  - dryer
- plug loads and lighting (other than those attached to building systems and appliances)
- Heat Recovery Ventilator (HRV), including
  - temperature conditions on all 4 sides of the HRV to calculate efficiency
  - temperature readings at exhaust inlet/outlet and supply inlet/outlet
  - air flow rates
- electricity produced by the solar PV array

The monitoring protocol and modeling strategies developed during the NZE program can be implemented in other northern communities, including remote, northern off-grid communities, to investigate options for the design, construction and technologies of net-zero energy homes. The protocol will also be useful for developing the framework/guide for creating successful, affordable and resilient net-energy zero housing.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risk Management

Identification of Risks

Table 3 – Performance Measurement Risks and Mitigation Strategies

Risks	Preventive Measures	Corrective Measures
Power loss to data loggers	Install data loggers with a battery backup and regularly verify power	Replace battery
Loss of internet connection		Data collected from sensors will be stored in a local computer until connection is restored and then will be transferred*
Faulty sensors	Test sensors prior to installation and after installation to ensure proper functioning and accuracy	Replace faulty sensors
Power loss to data collection computer	Use a battery power supply and an uninterrupted power supply (UPS)	Use backup Laptop computer Reboot computer when power is restored*
Data collection program crashes	A script has been written to force laptops to automatically reboot at certain intervals to ensure performance	Laptop will be restarted manually if necessary*

** On-site support is available in Eastmain allowing remote troubleshooting*

CHAPTER 3: PROJECT MANAGEMENT

The CNE has put significant effort into establishing a project management framework that will cover all phases of the NZE program. From identifying resources and needs to develop resources locally, to identifying the accounting, monitoring and reporting methods the project management plan proposed by the CNE will ensure the success of our NZE program.

To be long-term, the NZE program must look to the future and find ways to bind the community to the program. The CNE therefore established partnerships aimed at building capacity locally in the trades and specialized fields. This will guarantee success of our NZE program as Eastmain becomes more self-sufficient and its residents have opportunities to grow and create better lives for themselves and their families.

Project Scope and Scheduling

Project Scope

The NZE program consists of several projects and phases. Starting with the construction of a net-zero energy Accessible House and NZE retrofit. In support of this program, the CNE will establish a warehousing and inventory-costing system. In the subsequent years, the CNE will add on projects in a carefully thought-out sequence, that will include an Elders House and Private Homeownership Houses.

In preparation of the NZE retrofit project, the CNE has availed itself of an Indigenous Services Canada initiative to carry out an inspection and full-scale assessment of 24

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

existing houses in Eastmain. The inspection will include an estimate of the costs of renovation and an appraisal of the house. The data obtained from this will assist the CNE in identifying the houses to be retrofitted under the NZE retrofit program.

The NZE program also consists of ancillary projects that will support the program. These include the construction or rehabilitation of a facility for warehousing construction materials and assembling building components. This facility will enable capacity-building and create employment and economic development opportunities for the residents of Eastmain, which in turn will pave the way toward creating a strong, healthy community.

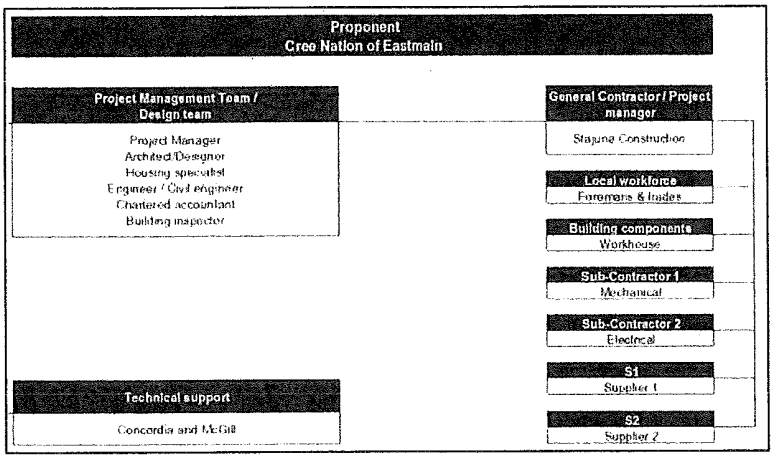
Resources Assessment

The CNE has the human, material and financial resources needed to make its NZE program a success. By phasing in the projects to be completed as part of the NZE program, the CNE will also ensure that it has the experience and capacity for each phase. This will also give it time to create capacity where needed.

Table 4 – Resource Assessment

Workforce Capacity		
The CNE has the human, material and financial resources needed to make its NZE program a success. CNE's construction company, Stajune Construction Inc., has experience carrying out large and smaller scale projects in Eastmain. An inventory of workforce resources has allowed the CNE to identify lacunae in the community and the areas where capacity-building must be focussed. In the interim, there are specialized tradespeople in other Cree communities and nearby Quebec cities who are eager to work on the pilot projects, while the CNE builds up its local capacity.		
Project management capacity	Experienced project manager	
	Housing specialist	
	Design consultant	
	Civil engineer	
	Chartered Accountant	
Trades capacity	**Trades**	**Quantity**
	Foreman	3
	Carpenters	21
	Machinery operator	16
	Plumber	0
	Electrician	0
	HVAC	0
Infrastructure readiness		
The CNE has **30 fully serviced lots ready** for new NZE homes. Eastmain has a **complete fiber optic infrastructure** throughout the community. This will enable long-term data monitoring and residents' access to the information obtained through the NZE program. There are local **warehouse facilities** where construction materials can be stored and building components assembled of. The CNE plans **to build or to renovate a warehousing facility** to store construction materials and assemble building components.		

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information



Workforce Capacity

The CNE will work with its construction company, Stajune Construction Inc., to implement the NZE program, each operating in their sphere of activity toward the success of the whole program.

The success of the NZE program rests on having a good foundation. In this case, the foundation is the project management team that will oversee the projects carried out under the NZE program and support to Stajune Construction in its management of the construction projects and cost control. The NZE Project Management Team will be made up of the resources identified in Figure 3.

The NZE Project Management Team has over 90 years of combined experience in finance and administration and 80 years in the construction industry. Project Management Team expertise includes financial management, LEED certification, super energy-efficient building techniques and northern and remote housing. The Team further benefits from the partnerships established with universities, government agencies and industry experts who have been involved in our NZE program.

Figure 3. Project Management Flow

Stajune Construction will act as the general contractor/project manager of the NZE construction projects. Work will be subcontracted out to local companies and entrepreneurs operating in the construction sector. The CNE has held consultations with local contractors who have all indicated their willingness to work collaboratively on the NZE projects. These contractors understand the critical issues and the importance of completing the various projects on time and on budget.

Current Workforce

In February 2019, the CNE held a construction meeting for the purpose of inventorying certain trades in Eastmain.

This inventory has allowed the CNE to identify lacunae in the community and the areas where capacity-building must be focussed. In the interim, there are specialized trades in other Cree communities and nearby Quebec cities who are eager to work on the pilot projects, while the CNE builds up its local capacity.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Although the CNE did not do an inventory of general labourers, a Cree Nation Market Survey compiled by Cree Human Resources Development (CHRD), there are approximately 17 men and 22 women looking for employment in Eastmain. Given that Eastmain's total workforce is 498, this yields an unemployment rate of approximately 8%.

Capacity-Building

To be meaningful and impactful to the community, the NZE program must be sustainable well beyond the scope and timelines of the Smart Cities Challenge. The CNE must therefore ensure that it can develop the capacity of the local workforce. Throughout its NZE program, workers will develop specialized skills including

- net-zero energy building techniques
- wall systems construction
- flooring
- cabinetry
- electrical and plumbing
- HVAC installation and maintenance
- roofing
- retrofitting

Planning for capacity-building activities has already started. The CNE is currently working with potential partners who are experienced net-zero energy builders, to provide work placement training. Four carpenters have been identified for training on net-zero energy construction techniques and systems. The training will give these workers the skills required to carry out and supervise net-zero energy construction.

In addition, two CNE employees will also receive work placement training on net-zero energy retrofits. These employees will work with our partner on a retrofit project to be carried out between March and April 2019. The retrofit training will include

- air tightness principles and techniques
- net-zero energy techniques
- wall systems construction
- digital capture techniques for dimensioning existing buildings
- supervising net-zero energy housing projects
- the do's and don'ts in retrofit projects

As part of the training, the partner will conduct follow-up site visits during the construction phase of our NZE projects between 2019 and 2020, thus ensuring the net-zero energy skills are fully integrated and rooted in Eastmain.

Other trades people have expressed an interest in receiving training in electrical and plumbing and HVAC installation and maintenance. The CNE will work with the Cree School Board and its partners to identify training opportunities for local trades. More

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

specifically, the CNE will begin exploring programs with the Cree School Board, CHRD and other vocational schools that offer certification programs in electrical, plumbing, carpentry and heating and ventilation systems. Ideally, training will be provided during the Smart Cities Challenge projects, with the goal of developing these skills in Eastmain within a five-year timeline. The CNE intends to invite skilled external tradespeople to Eastmain to work on NZE projects who will be required to hire local apprentices. It is anticipated that this approach will reduce construction costs because the use of external contractors generally means higher hourly fees and costs associated with travel, and room and board.

The CNE will not only focus on the trades side of the NZE projects but will also identify training opportunities aimed at augmenting project management capacities locally. Eventually, the CNE intends to have local people trained as certified project managers through the Project Management Institute. More importantly, the CNE will look to obtain comprehensive training in cost accounting and MS Project.

One identified area of concern is the need for qualified building inspectors. In fact, the lack of qualified building inspectors who can verify that homes and other constructions have been built to National Building Code standards is often cited as an underlying, contributing factor in the quality of construction projects in the Canadian north. Meanwhile, the CNE is presently training Home inspectors through a program funded by CHRD and offered by Cree Nation Government. These newly qualified Home inspectors will be instrumental in recommending suitable homes for NZE retrofitting to the Cree Nation of Eastmain.

The CNE has also identified other opportunities for capacity-building of the local workforce. These include

- collaborating with the National Research Council (NRC) to develop building science and related construction skills through seasonal employment of a local Indigenous engineering student on NRC building science research projects
- collaborating with Concordia University Department of Building, Civil and Environmental Engineering and the Centre for Zero Energy Building Studies to develop engineering and building science skills in Eastmain, which has a long-term goal of having a Cree engineer and encompasses the opportunity for a local Cree student to
    - work with the Concordia University data monitoring team to install equipment and collect data on our NZE projects
    - assist with project oversight and data collection relating to, amongst others, materials, production by trades and costing
    - enroll in the Engineering Co-op program and have a summer co-op placement in Eastmain

Financial Resources

Both the CNE and Stajune Construction are subject to independent public audit by a financial auditing firm. As part of the Cree Nation of Eastmain's IMS implementation, contractor and supplier management will also be audited throughout the NZE program.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

With the exception of the Smart Cities Challenge winner's prize and revenues that will be generated through the lease or sale of housing units, funding for our NZE program has been secured. In identifying funding, the CNE did not identify government and agency funding programs that may be accessed to complete projects under the NZE program because these must be applied for and, until approved, cannot be considered secured sources of funds. However, the CNE will apply for available funding under different programs.

The CNE financial resources include allocations from the CNE Local Economic Development Fund, the annual subsidies for housing and infrastructure under the Infrastructure Fund, funds from the Housing Action Plan and Cree Nation Government regular program subsidies.

Infrastructure Readiness

The actual construction of net-zero energy homes means that there must be sufficient space and adequate infrastructure to support the new construction. The CNE has recently completed a geomorphic study of the entire community.

Weather is always a risk in the James Bay region. Cold temperatures and snow can arrive early and often stay late into the construction season. The CNE knows that weather often results in delayed completion of construction and the deterioration of materials purchased for projects. While the CNE cannot control weather, it can take steps to mitigate the impacts weather has on its NZE projects. In order to attenuate the impacts that the northern climate has on the timely completion of construction projects and the inherent costs arising from delays, the CNE plans to establish a warehousing facility. The facility will be used to inventory and store construction materials and to assemble certain building components. More importantly though, by having a local warehouse, the CNE can order materials and supplies in bulk for projects before the start of the construction season, avoiding the added delays resulting from transportation times.

The CNE has carefully considered two options for such a facility. An existing warehouse in Eastmain that can be renovated to accommodate the needs of the NZE program, or the CNE can construct a new building. Each option was costed. Renovation of an existing warehouse will cost approximately $450,000 while a new build comes in at around $1,464,613 of which up to 70% can be leveraged through capital funding programs which amounts to almost $1,000,000 of the total cost. This brings the costs of a new build in line with those for the renovation.

The new build, as costed, would be significantly larger, at 8,100 square feet as opposed to 3,500 square feet for the existing facility. In addition, this facility will also be used for the assembly of building components thereby reducing construction times and lowering construction costs while creating employment and economic development opportunities in Eastmain. In light of these benefits, the CNE has chosen to proceed with applying for funding for the construction of a new facility. If approved, the CNE can proceed with construction in 2019. If the CNE is not allocated funding under these programs, it will

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

examine the advantages of renovating an existing warehouse versus scaling the new build smaller in order to be able to carry out construction as funds becomes available.

Table 5 – Comparison Facility New Build vs Renovation

Options	Description	Building area (sq2)	Cost
1	Existing warehouse renovation	3,500	$450,000.00
2	New building	8,100	$1,464,613 (which includes a maximum grant up to $1M)

The facility, if a new build, will be owned and operated in partnership by the CNE and Stajune Construction as a community project. The new facility would also serve as the offices of the CNE Housing Department and as a maintenance shop. The Housing Department will be responsible for the areas of the facility where bulk ordered construction materials for NZE homes are stored and for the Housing Department's preventive maintenance programs. Another area of the facility will be used for the assembly and storage of the building components.

The facility will allow for the assembly of building components during the months of November to May, eliminating costs that occur from building during winter conditions. As well as increasing the length of the building season, the facility will also take advantage of being able to carry out work in a facility that is dedicated specifically for constructing building components such as wall panels.

The stored materials will be used for housing units constructed under the Smart Cities Challenge, band housing, ongoing housing preventative maintenance programme, the construction of cabinets and the resale of building materials to Eastmain residents who have no local option for attaining building materials for household projects.

In the event the facility is not completed before the CNE must order materials for year 2 of the NZE program, there are other warehouse facilities in the community. These can be used on a short-term basis to store construction materials delivered before completion of the facility and to assemble the building components that will be needed in the upcoming projects.

Project Management Strategies

Our NZE program is ambitious and large-scale. With so many areas of activity it is essential to come up with strategies for addressing issues, managing procurement and supply chain, ensuring outcomes are impactful on the stakeholders and that communications enhance community inclusion. The CNE has systems and processes already in place that are the foundation to its project management strategies.

Risk Identification and Mitigation

All projects face challenges that threaten their success and none more so than construction projects that are vulnerable to weather, supply, transportation and many

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

other factors. The CNE and its partners have identified these risks and designed strategies aimed at avoiding these risks or mitigating their impact on the NZE program.

Since being selected as a Smart Cities finalist, the CNE has identified certain risks that it mitigated by adjusting its NZE program to ensure it can achieve the stated outcomes. More particularly, the CNE had concerns that the timelines, vis-à-vis its present capacity, and financial resources put at risk the success of the NZE program. Consequently, the CNE has modified the timelines and milestones, setting attainable objectives and phasing in parts of its NZE program. By starting with smaller, more contained projects, the CNE will be able to test its processes and procedures and validate its choices to ensure the success of the NZE program.

CNE has also had to re-evaluate its initial proposal after it carried out program costing. Presently, there are no programs in Quebec that support residential applications of solar and alternative energy. As a result, the inclusion of certain net-zero energy technologies added significantly to the costs of construction of NZE homes. In order to control these costs, the CNE has considered constructing net-zero ready homes provided that these homes achieve near net-zero performance and offer the same characteristics in terms of design and resilience. And develop a local "Green Technologies" program to subsidize the purchase and installation of solar photovoltaic systems, similar to programs in other provinces.

There are also risks inherent in relying on technology which may be protected by patent or copyright, difficult to obtain or service or subject to frequent modifications. By relying on commercially-available technology and equipment the CNE will be reassured of their quality and availability as well as the ability to obtain professional technical support when needed.

Table 6 – Risk Analysis

Cause	Risk	Mitigation measures	Risk (3 to 1)
Lack of available workforce	Failure to attain level of local capacity needed for projects	▪ Recruit locally for skilled trades ▪ Train additional tradespeople ▪ Contract/hire externally	2
Design flaws Energy modelling based on assumed data Quality during construction	Failure to reach net-zero targets	▪ Carry out additional data modeling using alternative programs ▪ Use data from weather station to verify assumptions in energy modeling ▪ Re-evaluate NZE construction details and technologies ▪ Implement inspection program and increase frequency of site inspections ▪ Augment net-zero construction training for skilled trades	1
Incorrect estimates of quantity of materials needed Construction modifications on site	Insufficient inventory of construction material	▪ Implement inventory control system ▪ Order materials 8 months before project start date ▪ Order needed materials for shipment to warehouse ▪ Evaluate and improve inventory control and estimates exercise	2

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Unexpected events on site Weather Extra work on site Incorrect productivity and work duration estimates	Failure to meet construction timelines	▪ Apply contractor/supplier management best practices ▪ Apply contract reward/penalty clause ▪ Hire experienced construction PM ▪ Use a project management software ▪ Conduct periodic evaluations of construction and project management processes ▪ Hire additional skilled tradesmen ▪ Implement process improvement measures ▪ Adjust project scope and timelines	1
Unexpected events on site Weather Extra work on site Wrong productivity and works duration estimates Wrong cost estimates	Cost overruns	▪ Implement contractor/supplier management best practices ▪ Hire experienced construction PM ▪ Conduct audit on all construction and project management processes ▪ Adjust project scope and budgets ▪ Identify source of cost overruns and apply audit findings to improve efficiencies	1
	Inability to sell units if purchasers cannot obtain financing	▪ Pre-screen and pre-qualify purchasers ▪ Identify new purchasers ▪ Reclassify private homeownership unit as rent-to-own	2
	Contractor unable to secure necessary financing to carry on construction work	▪ Assist companies in accessing capital funds on a project-by-project basis ▪ Encourage partnerships and joint ventures between companies to improve financial capacity ▪ Manage the project directly through Stajune ▪ Increase CNE investment in the project	2
Fail to do credit check / obtain information on tenant financial capacity	Inadequate rent collection to support operation/maintenance of rental units and to build reserve funds	▪ Pre-qualify renters through credit check ▪ Verify capacity to pay ▪ Credit bureau reporting on delinquent accounts ▪ Ensure agreements are fair to CNE and tenants but protect CNE investment ▪ Terminate rental agreement and evict delinquent tenant ▪ Require solvent co-signer on rental agreements ▪ Sanction arrears by forfeiture of CNE subsidies and application of grants to rental arrears ▪ Suspend eligibility for CNE grants, loans and subsidies to persons with rental arrears ▪ Take legal action	2
Incomplete surveys or site inspection	Ground bearing capacity too low (geotechnical)	▪ Verify ground composition with a geotechnical survey ▪ Mention geotechnical details in contract documentation ▪ Install piles or other system to reinforce foundations	2
	Incomplete building design	▪ Foundation modifications with geotechnical survey ▪ Verify design exceptions (solar panel, insulation, etc.)	2
	Lack of interest from buyers	▪ Explain NZE experience by using pamphlets ▪ Bring out the difference made in community and chance to realise unique projects	2
	Experience in NZE units does not meet occupants' expectations	▪ Confirm occupant satisfaction with the design ▪ Ensure design meets occupants' need before occupancy ▪ Conduct extensive and redesign of future housing units	2
	Negative reaction to living in multi-unit housing	▪ Evaluate underlying issues affecting satisfaction ▪ Elaborate construction strategies to address these issues ▪ Conduct consultation to identify occupants' concerns and needs	2

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

		▪ Develop and implement a strategy that addresses these issues	
	Improper use of building technologies (smart, HVAC, alternative energy, security)	▪ Pre-occupancy education and training ▪ Create/distribute information pamphlets and labels ▪ Carry out inspections and surveys ▪ Train occupants in the use of all technologies	**2**
Incomplete information given to occupants on their role in NZE program	Occupants do not consent to the collection of personal information	▪ Explain stakeholder engagement that clearly adheres to all PIPEDA principles ▪ Restrict data collection to units where occupants gave consent ▪ Restrict data access to CNE or external, as the case may be ▪ Take steps to alleviate occupants' concerns with data collection	**3**
Mismanagement of data Database system incomplete or missing	Intentional or unintentional data loss or data security breach	▪ Execution of data storage and security agreements with partners based on PIPEDA principles ▪ Application of CNE ISO/IMS and audit programme ▪ Institute preventive measures and corrective actions identified in the audit programme ▪ Re-evaluate and make necessary changes to data access and security arrangements	**2**
Collaboration contract not made Terms of the research were not explained or well understood	Resident disengagement from long-term research activities assessing impacts on well-being	▪ Conduct community meetings with partners to discuss relevancy of project objectives to residents' needs ▪ Establish communication plan to engage meaningfully with residents through sharing circles, social media and other forums ▪ Adapt the project continuously to reflect community feedback ▪ Communicate with local CMC workers to identify and address barriers to community engagement	**3**
	Housing assignment leads to real or perceived iniquity amongst CNE members	▪ Conduct analyses of changes in home and health status and health over time ▪ Identify at-risk sub-population groups based on analyses ▪ Adapt housing policies to implement suitable interventions to populations groups most at-risk for housing inequities	**2**

*Note: highlighted risks directly linked to KPIs in Table 11.

**Note: floor plans were designed to allow living area to be reduced by removing rear section from first floor.

Procurement

In order to control the costs of the NZE projects, the CNE has created a procurement strategy. The strategy was developed with significant consultation with industry stakeholders to ensure its feasibility.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 7 – Procurement Strategy

PURCHASING & EXECUTION STRATEGY			
Purchasing strategy	▪ Benchmark ▪ Use of local workshops ▪ Material transport optimization ▪ Use of cost comparison sheet ▪ Use of progressive billing for each contract ▪ Apply holdbacks ▪ Detailed cost breakdown ▪ Formal tendering process ▪ Use of templated CNE contracts prepared ▪ Bulk material ordering (see project execution strategy)	Project execution strategy	▪ Specially timed purchasing of construction materials ▪ Construct or rehabilitate a facility used to warehouse construction materials ▪ Implementation of processes for inventory control ▪ Purchase large quantity items and carry out procurement in the fall for the following year ▪ Invite specific suppliers to negotiate further on costing and quality of materials ▪ Prepare detailed list of materials used
Approved by	**CNE financial administration**	**Date**	

Important savings can be generated through bulk and specially-timed purchasing of construction materials. As previously explained, the CNE will construct or rehabilitate a facility that can be used to warehouse construction materials. This will enable the CNE to implement processes for inventory control which in turn will play a role in maintaining adequate inventory to complete projects on time and on budget.

Identifying what to purchase will be done when the CNE completes its pilot projects (Accessible House and 1st Retrofit) in year 1 and prepares a list of all materials used.

All procurement of materials and services must comply with the CNE Financial Administration By-law and established policies. This By-law imposes approvals procedures and certification of available funds prior to contracting. Any gaps in the By-law will be filled by procedures aimed at ensuring fairness, openness and transparency in the procurement process that favour accountability and responsibility.

The CNE has established relationships with suppliers to ensure that they understand the procurement process going forward. In addition, the CNE will ensure that it always has a Plan B with an alternate supplier in the event a selected supplier is unable to respond to the NZE project needs. Where appropriate, standardized, templated contracts prepared by the CNE will be used. These contracts set out clear deliverables, timelines and the obligations on each party to favour a constructive, collaborative relationship with suppliers.

Concordia University will be assuming responsibility of procuring the technologies to be used to monitor the performance of the homes. Concordia will contribute $25K to the purchase of equipment. The CNE is actively seeking additional partners to offset costs. If a partner is not found, the CNE will cover the costs through project funds.

Stakeholder Impact and Influence

There are several stakeholders in our NZE program. From residents to local businesses and outside suppliers to governments and agencies, our NZE program will impact these

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

stakeholders in different ways. All stakeholders can impact the success of the NZE program and influence its implementation.

Stakeholder engagement will use the principles set out in the CNE Quality Management System and be auditable within the scope of our Information Management System (ISO/IMS).

Table 8 – Stakeholder Impact and Influence

Stakeholder	Impact on Stakeholder / Stakeholder influence on NZE program
Residents	Most impacted stakeholders as will have opportunity to own or rent an NZE home
	Success of private homeownership program will depend on interest in investing in houses
Suppliers	Impacted by new business and economic development opportunities
	Influence the affordability of NZE housing which will impact success of NZE program
Local Business	Impacted by employment and economic development opportunities
	Influence the success and affordability of our NZE program
Council	Impacted by success of program in fulfilling promise to create a stronger, healthier community
	Influence the success of NZE program through budgetary appropriations and funding
Government Agencies	Influence stakeholder policies and programs by the findings of monitoring and studies
	Influence the success of NZE program through funding programs and policies

Through the program, Eastmain residents will be the most impacted and influential on NZE program success. The opportunity to own a home is gaining momentum in Eastmain as a means for enabling residents who have the financial capacity to move away from the social housing program and fulfill a dream shared by many Canadian - that of having one's own home. Nonetheless, the sale of NZE Private Homeownership Houses will be dependent on the interest and motivation of residents to obtain loans through financial institutions.

The NZE program will have an impact on and influence the sense of community pride. To be enduring though, it is essential that occupants of NZE homes understand the functionality of these homes and the technologies used. The goal is to ensure occupants get the most out of their homes. Consequently, every occupant of an NZE home, regardless of the type of home, will receive training and information on the operation and maintenance of their homes including,

- the use of the monitoring equipment
- cleaning and replacing HRV filters
- programming thermostats
- monitoring solar energy production
- monitoring daily energy use

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Suppliers

Suppliers of construction materials will influence the affordability of NZE housing and the ability to sell Private Homeownership Houses in Eastmain. If the costs are excessive, this could prevent expansion of a private housing market. However, Suppliers will have an interest in ensuring success as this can lead to partnerships to provide construction materials to the CNE for its NZE program. The CNE will leverage the potential scope of its NZE program to ensure suppliers see long-term benefits in ensuring affordability.

Local Business

Local construction companies and tradespeople will directly impact the success and affordability of our NZE program. If the costs are excessive, this will limit the number of houses that can be built by the CNE and could put at risk its stated goal of addressing the housing crisis and building a strong, healthy community.

However, the NZE program will be very impactful on local construction companies and tradespeople. There will be substantial opportunities for local construction companies and tradespeople to specialize in assembling building components and gaining NZE building expertise, including opportunities to be licensed as carpenters, electricians, plumbers or HVAC technicians. Construction companies and tradespeople will be assured of year-round work since assembly would be done in the off-season. Moreover, the CNE has put time and effort into identifying and planning training to increase the numbers of skilled tradespeople.

Council

Council will influence the ability of the CNE to carry forward the NZE program. If adequate annual funding contributions are not approved for each of the six years, then the CNE may be unable to carry out all or certain projects in a given year. The NZE program will be particularly impactful on Council if it achieves the stated goal of reducing the backlog in housing and creating a healthy and strong community.

Government Agencies

Through their support of the NZE program, government agencies can influence its success. If funding is provided for training and certification opportunities, for green energy initiatives and for housing, this will supplement funding allocated by Council. This support will fuel immediate, short-term success but will also contribute to the sustainability of our NZE program.

Our NZE program could potentially influence government agencies' thinking and strategies on housing in Indigenous communities.

Communications

The CNE will continue its community engagement process including, the Cree Cafés, general assemblies, housing forums and special community meetings. This engagement process will enable the ongoing assessment of the community's NZE experience and aspirations.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

In the 2019-2020 fiscal year, the CNE will also start leveraging social media as a means to receive feedback on its NZE program. This process has already started as the CNE is planning to redefine and redevelop its website so that it offers more and better information to CNE members.

The CNE is also developing a training program for NZE home occupants on the functionality of their NZE homes. This program will include one-on-one sessions delivered by a Cree Nation Government housing specialist.

A project management communication plan was prepared and will be followed in order to implement the construction phase of NZE projects according key performance indicators[4], year after year through the whole project cycle.

Table 9 – Communications Strategy

Communication	Frequency	Goal	Responsible
Project team			
Project status report	Weekly	Review project status and discuss potential issues or delays	Project manager
Team stand up	Daily	Discuss team member activities of previous day and current day, and any obstacles	Project manager
Task progress updates	Daily	Share daily progress made on project tasks	Project manager
Project review	At milestones	Present project deliverables, gather feedback and discuss next steps	Project manager
Post-mortem meeting	At end of project	Assess what worked and what did not work and discuss actionable takeaways	Project manager
Project proponent			
Project status report	Weekly	Review project status and discuss potential issues or delays	Project manager
Project review	At milestones	Present project deliverables gather feedback, and discuss next steps	Project manager

Monitoring, Controlling and Reporting

Monitoring will be essential to ensuring productivity, scheduling and timeframe goals are respected. During construction, daily site visits and inspections will be carried out by the project manager and CNE building inspector. Both will report to the CNE on the advancement of the project(s) and any issues. This process will enable the CNE to monitor

[4] The KPIs are described more fully in the monitoring, controlling and reporting strategies section and Table 7 below.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

project deliverables and major milestones in each project and react, if required, to any issues in a timely manner.

The man hours worked, and all materials used will be recorded by an onsite foreman with respect to all labourers and construction material. Having this information is particularly important as it will ensure that the CNE can properly plan the costing and time requirements for the different housing projects.

Table 10 – Monitoring, Controlling and Reporting Strategies

Financial management
▪ SAGE 300 Premium with customized Cost Accounting modules ▪ MS Project Manager add-ons that is auditable to the International Financial Reporting Standards (IFRS) ▪ Chartered accountant

Project management
▪ Experienced project manager responsible for all the monitoring, controlling and reporting ▪ Record of worked man hours by onsite foreman. ▪ During construction, daily site visits and inspections carried out by the project manager building inspector

Technical monitoring			
Monitoring	**Inspection**		
Net-zero monitoring ▪ Hygrothermal performance of the building envelope to ensure durability ▪ Indoor environment quality including (air quality and thermal conditions) ▪ Energy performance including end energy use of HVAC equipment, lighting, appliances and equipment ▪ Energy generation of the photovoltaic system	**#**	**Phases of inspection**	**When**
	1	Foundation	Before backfilling
	2	Framework	Before door and window installation
	3	Tightness	Before drywall installation
	4	Exterior cladding	Before commencing exterior cladding
	5	Interior finishing	Interior finishing

The CNE has an asset management system that includes computerised preventive maintenance management system for the community, which includes the housing department.

An important part of the management plan will include the key performance indicators as presented below.

Table 11 –KPI Tracking

#	Title of Key Performance Indicator	Measure unit	Target value
1	Energy consumption of each unit	kW/h/year	Production equals consumption
2	Indoor environmental quality	Relative Humidity CO2	40– 50 % 350-1000 ppm.
3	Construction cost	$	< 10% budget overrun
4	Number of units	Number of units/year	As planned

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The logical framework below is a management tool that gives a summary of a project, in this case the Accessible House project, to describe the project objectives, methods for verification and risks on an outcomes-based methodology.

Table 12 – Logical Framework for Accessible House pilot

TITLE OF PROJECT: Accessible House Pilot Project	**Project Starts:** Jun 2019 **Project Ends:** Sep 2019 **Date Today:** Nov 2018	
DESCRIPTIVE LEVELS	**METHODS FOR VERIFICATION**	**PROJECT RISKS**
OBJECTIVES ▪ Design a culturally-appropriate accessible house adapted to special needs of individual confined to a wheelchair ▪ Develop construction details for attaining net-zero energy performance to reduce operating costs ▪ Determine level of solar production required to attain net-zero energy performance ▪ Evaluate and develop cost-effective construction techniques to ensure end costs are affordable for social housing	▪ Design verification through interviews with special needs tenant on satisfaction and responsiveness of lay-out ▪ Post occupancy energy monitoring of energy consumption patterns ▪ Verification of net-zero status, including energy performance of the solar system, through extensive energy monitoring ▪ Detailed post-construction evaluation of construction costs and a cost benefit analysis of the construction system and technologies	**OBJECTIVES VS OUTPUTS** ▪ House does not meet the needs of special needs tenant, his caregiver or medical support staff ▪ Building system is not cost-effective ▪ House does not attain net-zero energy status ▪ Tenant does not consent to disclosure of data collected on the project and unable to collect data on individual energy use patterns ▪ Selected tenant refuses to move in or fails to qualify for social housing
OUTPUTS (Expected Results): ▪ Completed Accessible House for Eastmain resident with special needs ▪ Energy monitoring over two years including detailed energy consumption and energy production data ▪ Reporting on the net-zero energy status of the house and its potential for certification as a net zero energy building. If net zero energy status is not attained, strategies for attaining this on subsequent houses will be developed and included ▪ Reporting on the net-zero energy building system, including a cost/benefit analysis of the net-zero building system ▪ Reporting on the house design based on feedback from the tenant, his medical support and the community	▪ Design verification through interviews with tenant on success of the design in addressing special needs ▪ Verification by building inspector that the house meets all code and other requirements ▪ Verification by an energy modeller that the design of the building meets net-zero performance ▪ Confirmation that all suppliers and builders/trades have been paid ▪ Signed lease agreement	**OUTPUTS VS INPUTS:** ▪ Tenant is not satisfied with the unit ▪ Local builders do not cooperate fully ▪ Supply chain is unwilling to negotiate effective cost saving measures ▪ Lack suitable lot for development ▪ Cost of construction is greater than available resources ▪ House does not attain net-zero energy status ▪ Adherence to all project management activities, timetables, and budgets ▪ Construction impacted by weather conditions ▪ Accessible House built according to plans and specifications
INPUTS: ▪ Significant community and individual engagement to develop designs that take into consideration cultural components ▪ Evaluation of the design must-haves of special needs tenant	▪ Submission of bids submitted by contractors and subcontractors ▪ Confirmation of available funds ▪ Preparation and execution of contracts and financial documents ▪ Completion of Tenant Selection Form	**PREREQUISITE CONDITIONS:** ▪ Lot with the proper orientation ▪ Optimum roof angle to maximize solar performance ▪ Local climatic data ▪ Energy requirements of the home based on the building system

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

▪ Evaluate the building system and the capacity required for the alternative energy system (solar) through energy modelling ▪ Develop plans for construction ▪ Engage with supply chain to establish a detailed materials list, costing and cost saving strategies ▪ Engage with local builders in elaboration of the building system and to identify the most cost-effective measures ▪ Engage experienced net-zero builders and skilled tradespeople familiar with the local environment ▪ Project management team experienced in net zero construction and cost accounting ▪ Capital development plan ▪ Available financial resources	▪ Confirmation of lifetime subsidy from CMHC ▪ Confirmation of mortgage from the bank ▪ Receipt of all plans and specifications for construction ▪ Adoption of Council resolution	▪ Calculation of energy needs and the size of the solar array based on energy needs to meet net zero ▪ Working drawings and detailed materials list ▪ Approved budget and secured sources of funding ▪ Contractual agreements that favour local capacity development ▪ Open book agreement with the construction companies to capture actual cost variables such as materials, labour, profit and administration ▪ Engagement with suppliers to develop ways to reduce material and delivery costs, and improve the stock of building supplies available within the community ▪ Occupant qualifies for social housing ▪ Project approval by Council

Sustainability

Table 13 – Sustainability Strategies

SUSTAINABILITY
STRATEGIES
The CNE has implemented various strategies which guarantee sustainability of the NZE program ▪ Taking a holistic approach ▪ Community members and stakeholders involved in defining and designing the NZE program ensuring the project can reach its full potential and respond to the needs of the community ▪ Laws, rules, guidelines and NZE projects discussed with suppliers and builders to ensure that they fully comprehend the framework and the expectations ▪ Through occupant feedback, the CNE will develop new designs and floorplans ▪ Rigorous monitoring and reporting requirements will enhance the level of trust residents have in the program **Training program** ▪ Training opportunities ▪ Hands-on training ▪ Certification opportunities: develop new skills or improve on current skills ▪ Business opportunities: new opportunities for employment and business development ▪ Lead to a stronger more economically and socially viable community The training and capacity building programs are being developed to enhance skills of local tradespeople with respect to net-zero energy construction and retrofits. Ensuring this capacity is essential for addressing the cost of constructing housing in the community, a key component in the SCC proposal. **Business plan for the development of the warehousing/building component assembly facility** This is being done for the purpose of developing a local housing industry and reducing the costs associated with private homeownership. The CNE will consider expanding the type of building components assembled to include roofing systems and foundation systems. This facility may allow the CNE to build a specialized sector supplying building components to other Indigenous and non-indigenous communities.

The CNE NZE program is guaranteed to be sustainable because of the holistic approach taken. From the beginning, community members and stakeholders have been involved in defining and designing the NZE program. This is essential to garnering the support

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

necessary for such an ambitious program, ensuring it can reach its full potential and respond to the needs of the community.

The CNE has also discussed the laws, rules, guidelines and NZE projects with suppliers and builders to ensure that they fully comprehend the framework and the expectations but also adjusting the NZE program to respond to certain realities identified by the suppliers and the builders. This step ensures that the NZE program is affordable and therefore attainable.

The monitoring and reporting mechanisms put in place by the CNE will also facilitate the NZE program sustainability. Having rigorous monitoring and reporting requirements will enhance the level of trust residents have in the program and ensure that costs are consistent for each type of housing unit constructed. Past experience has shown the CNE and Eastmain residents that housing costs can vary significantly even for similar housing types built during recent construction seasons, which undermines residents' confidence in the residential construction industry.

Finally, sustainability depends on building capacity in Eastmain. Providing training opportunities, hands-on training, certification opportunities and business opportunities will enable Eastmain residents to develop new skills or improve on skills they already have and offer new opportunities for employment and business development. This can only lead to a stronger more economically and socially viable community and ensure that the NZE program can continue.

The training and capacity building programs are being developed to enhance skills of local tradespeople with respect to net-zero energy construction and retrofits. Ensuring this capacity is essential for addressing the cost of constructing housing in the community, a key component in the SCC proposal.

To continue its NZE program, the CNE is preparing a business plan for the development of the warehousing/building component assembly facility. The CNE will consider expanding the type of building components assembled to include roofing systems and foundation systems. This facility may allow the CNE to build a specialized sector supplying building components to other Indigenous and non-indigenous communities.

As long as there is a demand for housing our NZE program will continue well beyond the Smart Cities Challenge. Our approach has been to establish Eastmain as the expert in the region on building net-zero energy houses. There is a backlog of more than 3,600 houses in Eastmain and the other Cree communities in Eeyou Istchee. This means that the CNENZE program has the potential to continue well beyond the timelines of the Smart Cities Challenge.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 4: TECHNOLOGY

Approach

The CNE's NZE program grounded on the use of smart technologies and construction technologies that are intended to enhance occupants' comfort and enjoyment of their homes and the homes' resiliency and efficiency.

While the developing the designs for the NZE houses entailed extensive community consultation, the design of the building systems and selection of the systems and technologies required to reach net-zero energy performance was carried out by a small technical team composed of experienced net-zero builders and a design consultant. The Team evaluated available technologies and construction techniques for the design of the systems to be used in the houses. Local builders were also consulted during this process to ensure that the systems and technologies identified for the project could be installed and maintained in Eastmain.

Energy Modelling

The first stage in the design of a net-zero energy building is to identify where energy consumption reductions can be maximized (through the building envelope, housing equipment and technologies) in order to lower the energy production needed to attain the net-zero energy target. This process included

- examining wall systems used in other net-zero housing projects
- drawing from lessons learned on super energy-efficient northern housing prototypes
- drawing from lessons learned on the modelling of other net-zero energy projects
- reviewing ongoing research being carried out in this field of work, including
  - *Panelized Building Systems for Northern Multi-Unit Residential Buildings*, prepared by Cold Climate Building Inc. for NRCan
  - *Design and Construction of Multi Unit Residential Buildings (MURBs) in First Nations communities: Challenges and Opportunities*, prepared for CMHC
  - *Net-Zero Energy Housing: CMHC's Equilibrium Program*

The Team put together by the CNE conducted energy modelling on the Accessible House and the Six-Plex[5] as these would be the first new housing projects constructed under our NZE program.

The Team first evaluated wall systems that had been successfully used on NZE houses in Edmonton, Alberta and other locations. An initial building envelope selection was made based on the experience acquired on net-zero single-and-multi-family builds. In addition to the requirement for net-zero energy performance, the Team took into account Eastmain's climate and the need for durable, easy-to-execute solutions that deliver good

[5] It should be noted that the Six-Plex is a multi-client build that offers the full range of occupancy: private homeownership, rent-to-own and social housing.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

occupant comfort and moisture control. At this early stage, the potential for prefabricating the system in a small local warehouse also became a significant consideration.

HOT2000 simulations were conducted on both the Accessible House and the Six-Plex using the same building envelope details for both. Several iterations were run as part of this exercise to test different combinations of building components (See Annex B, C, D and E).

At the same time, the Team ran a HOT2000 file using electric resistance heating and hot water and set the coefficient of performance of the cooling system to 1.0. The exercise delivered some surprising results with HOT2000 showing a cooling load in every month of the year – January to December – in the 7400 heating degree day climate of Eastmain. The annual cooling demand was greater than the annual heating demand.

Table 14 – Accessible House HOT2000 Results

	HOT2000 Homesol (kWh/a) (adjusted)	COP	HOT2000 Homesol (kWh/a) (adjusted)	HOT 2000 PA (kWh/a)	COP	HOT 2000 PA (kWh/a)	IES VE (kWh/a) w/ Heat Pump COPs
Annual Heating Demand	2774	1.4	1981	2650	1.4	1893	5535
Annual Cooling Demand	8617	3.5	2462	5293	3.5	1512	94
Annual DHW	4395	2.6	1690	5562	1.5	3708	2633
Lighting, Appliances, and Misc Electrical	7000	1	7000	6500	1	6500	6000
Total Annual Energy Required			**13134**			**13613**	**14262**

In both cases, the HOT2000 predictions for peak heating capacity seemed low when compared to the Team's experience with high-performance buildings in Edmonton's milder climate, while the peak cooling load seemed high.

Table 15 – Accessible House Heating and Cooling Loads

	HOT2000 (PA) Peak Watts	HOT2000 (Homesol) Peak Watts	IES VE Peak Watts
Design Heat Loss at -40C	3261	3100	5940
Design Cooling Load at 25C	1605	3600	2900

The results were far enough from expectations that the CNE commissioned ReNu Engineering to run a dynamic energy model using IES VE for comparison (See Annex F).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 16 – Hot 2000 IES VE Energy Modelling Comparison

HOT2000 and IES VE Energy Balance for Accessible House	HOT2000 (kWh/a) (adjusted)	COP	HOT2000 (kWh/a) (adjusted)	IES VE w/o Heat Pump COPs (kWh/a)	COP	IES VE w/ Heat Pump COPs (kWh/a)
Annual Heating Demand	2774	1.4	1981	8500	2	5535
Annual Cooling Demand	8617	3.5	2462	329	3.5	94
Annual DHW	4395	2.6	1690	6583	2.5	2633
Lighting, Appliances and Miscellaneous Electrical	7000	1	7000	6000	1	6000
Total Annual Energy Required	22786		13134	21411.5		14262
Annual output from 45 – 330-watt PV modules	15500		15500	15500		15500
Potential Annual Surplus	-7286		2366	-5912		1238

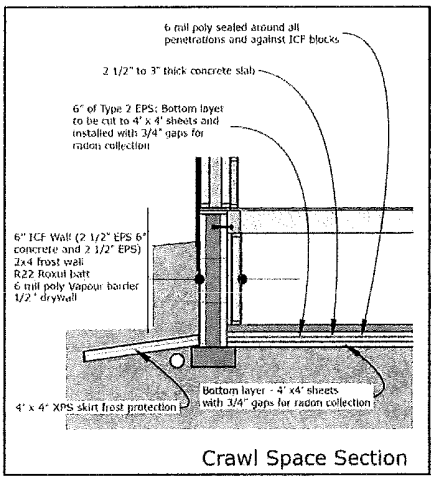
An analysis of the results did not explain the departure from expected results. However, independent longhand calculations based on the hourly weather data for La Grand Riviere, Quebec, a location with similar climatic data, favoured the IES VE results. The Team therefore chose values closer to the IES VE results to calculate the net-zero energy balance.

HOT2000 results for the Six-Plex were similarly surprising. Although these results have not been tested against the IES VE energy model, it will be possible to utilize the significant extra roof capacity of the Six-Plex to install additional solar photovoltaics if it is necessary to increase energy production in order to achieve the net-zero energy target.

The energy modelling exercise was also used to determine the other technologies and building equipment needed to achieve the net-zero energy target. This included assessing windows (fiberglass frame, triple glaze, double low e and argon filled), appliances (top 20% Energy Star performance) and lighting (LED) as well as the size of solar array required.

Based on the modelling, the roof design of the Accessible House was modified to increase the size of the solar array. Modelling also disclosed that solar energy alone would not enable the house to attain the net-zero energy target. Consequently, the Team gave significant consideration to the desirability of using an air-source heat pump versus a ground-source heat pump to ensure net-zero energy performance. Even though lower in energy performance, the Team selected the air-source heat pump because of its significantly lower installation costs and maintenance requirements.

The super insulated envelope, air-tight construction, and energy recovery ventilation system allows for a 90% reduction in annual thermal energy demand intensity relative to typical construction. The significantly reduced thermal energy demand when combined with the high-performance mechanical system and on-site renewable energy generation allows for annual net zero energy consumption. This results in an annual greenhouse gas emissions savings of 861 kg CO_2 eq for the Accessible House as compared to standard construction techniques.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The Building System

The selection of building materials and equipment were heavily influenced by Eastmain's remoteness and the impact this has on construction costs and housing affordability. The components of the building envelope were selected on the basis of their

- affordability
- durability
- ability to be constructed by local tradespeople
- ability to deliver the very high level of energy efficiency required for net-zero energy performance in cold climates

Figure 4. Crawlspace Detail.

Typically, houses in Eastmain have been built on full-height poured concrete foundations – a system that is known to be costly and a problem area for mould issues in many houses in the community. For this reason, there was considerable interest in exploring alternative foundation systems for houses to be constructed under the NZE program. Detailed costing and energy modelling were carried out on the use of slab on grade versus a frost-protected shallow foundation (crawlspace). While modelling showed there was very little difference in the energy performance of the two foundation types, consultation with local builders disclosed their concerns with slab on grade foundations vis-à-vis accessibility to plumbing and other household systems. Local builders also indicated that a shallow foundation was more feasible and made it easier to install services. In addition, the Team determined that the site preparation for a shallow foundation is simpler and less susceptible to inclement weather. Based on feedback and these other considerations, the Team selected a frost-protected shallow foundation for the CNENZE program.

The frost-protected shallow foundation will consist of a 4' high, 6" insulated concrete foundation (ICF) wall on an appropriately sized concrete spread footing. The crawl space will be sealed with a continuous air and vapour barrier and included in the heated envelope. The effective insulation of the foundation wall is R-43, the under-slab insulation is R-24 and the footing skirt is R-20. To minimize the use of concrete, an expensive commodity in Eastmain, the foundation wall was reduced to 6" and the under-slab to 3".

All houses constructed under the NZE program will have a double 2x4 cellulose filled wall with a protected interior air/vapour barrier and an exterior airtight water-resistant barrier. The assembly includes a 2 ½" interior insulated cavity to accommodate services. This assembly was chosen because it satisfies all the below criteria.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **The system is economical**
  Double stud 2x4 walls have been consistently shown to be the most economical method of building a high R-value wall, particularly when compared to the commonly used application of layering foam insulation to exterior of wall assemblies.

- **The system is durable**
  High R-value walls generally means a higher risk of condensation on the inside surface of the exterior sheathing. The Team has mitigated this risk in the selected wall system in several ways. Firstly, the wall system will use a well-sealed air-vapour barrier using taped foil-faced fiberboard to substantially reduce infiltration of moisture in the walls. Air leakage in the envelope will be reduced by using the Cossela Dorken Delta Vent SA, a sealed air-tight, vapour open, water-resistant barrier. In addition, the walls will be filled with cellulose insulation, which is highly hydrophilic, to absorb and allow the slow diffusion of any remaining moisture. Diffusion of moisture will be facilitated through diffusion vents installed high in each stud cavity, which will allow any moisture that does accumulate to escape into the vented rain screen. The R-values and air tightness are such that the inside surfaces will remain well above the dew point over a wide range of temperatures thus decreasing the risk of condensation and mould in the NZE houses.

- **The system materials are easily obtained**
  Other than the Delta Vent SA, the water-resistant membrane and the cellulose insulation, all the materials are readily available in Eastmain. The Delta Vent SA membrane and the cellulose insulation are easily found in the normal construction supply chain.

- **The system is buildable by the Eastmain workforce**
  Assembly of the wall system is very similar to standard western platform framing, a common residential construction technique used all over North America. The use of a 2x3 wiring chase inside a sealed foil-faced fiberboard vapour barrier is currently used in a housing project being constructed in Eastmain. The use of exterior rain screens is also common.

- **The system provides excellent energy performance**
  The wall system has an effective R-value of 53. Any increase in the R-value above this level would not be cost-effective because it would provide minimal additional energy savings at a comparatively high cost.

The Team selected fiberglass framed, triple glazed, argon filled sealed window units with 2-Cardinal LoE272 coatings. The roof cavity will be configured to offer a total R-80 (approximately 24") of cellulose insulation. The ceiling vapour barrier will be installed and sealed to the bottom of the trusses and supported with 2x3 strapping 24" on centre prior to building the interior partitions which will provide a chase for electrical wiring without penetrating the air/vapour barrier.

Particular attention was given to the selection of a Heat Recovery Ventilator (HRV). HRVs have been used in Eastmain homes for several years, but their performance has been inadequate. Often, the performance issues arise from improper HRV installation, or the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

decision by occupants to turn the HRV off because of (a) a misperception that these contribute to high energy costs, (b) noise, and (c) the impression that cold air enters the home through the HRV. The poor performance of HRVs in Eastmain, regardless of the reasons, reflects one of the ongoing challenges to maintaining healthy indoor environments in houses across the Canadian north.

In order to address this issue, the Team worked with an HVAC consultant to design an HVAC system for the NZE program. The Team carried out a second modelling exercise using dynamic IES VE 3D building performance analysis software to confirm findings and further evaluate air conditioning requirements. Based on this modelling exercise, the Team finalized the design of the building system and construction details and made changes to the roof design to allow for additional photovoltaics. The energy modelling was then finalized using these selections (See Annex G).

Our Technologies

A wide range of technologies will be introduced to the community through the CNENZE program. All these technologies, including new technologies not yet used in the community, are commercially available.

The technologies selected have a role in ensuring the NZE program attains the net-zero target, in monitoring and evaluating the houses and in building the houses. The Team evaluated energy saving and energy producing technologies including the building system (i.e. the design and construction of a foundation, walls and ceiling), building components (windows, doors, lighting, etc.), the HVAC system, and the solar photovoltaics.

Net-Zero Energy Housing

Although net-zero energy homes are not new to Canada, they are new to the Canadian North and to the Eeyou Istchee. Throughout Canada, innovations in the residential construction industry are developed locally and regionally, and innovations developed in one region must be tested in another. In each of Canada Mortgage and Housing Corporation's Equilibrium projects, for example, innovation focused on the specific combination of building systems and technologies that were used to achieve net-zero. For this reason, the Equilibrium programme targeted the development of net-zero energy housing prototypes across the country, except the north. The net-zero energy innovations also focussed on developing and refining construction processes to ensure that net-zero energy homes are competitive on a cost-benefit basis. This has been the same focus in Eastmain.

The CNE will ensure it builds capacity locally with respect to new technologies and systems being introduced into the community under the NZE program. As such, capacity building will be provided in areas such as solar photovoltaics, air-source heat pumps, energy monitoring technologies and smart home technologies.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Net Zero Energy Technologies

The Team evaluated the energy saving and energy producing technologies required to satisfy a net-zero energy performance standard. The evaluation included selecting the materials required for the design and construction of the building envelope (i.e. foundation, walls and ceiling), the building components (windows, lighting, etc.), the design of the HVAC system and the size of the solar photovoltaic system. More specifically, the Team selected

- **Double 2x4 Wall System**
  The Team chose a wall system that is used extensively in Alberta, Saskatchewan and the Yukon. The system can be used on both new construction and on net-zero energy retrofits, and it can be assembled on site or prefabricated in a small local shop. This latter characteristic was important as it falls in line with the Cree Nation of Eastmain's plan to construct or rehabilitate facility where wall systems can be assembled locally. Even though prefabricated wall systems have been used in remote communities, the CNE project to create a facility where these can be assembled in a remote community is innovative.

- **Building Components**
  All the building components, including windows, doors, lighting and appliances were carefully selected to ensure that the wall systems would perform to a net-zero energy standard. The Team selected the following components for the NZE program, which will first be used in the construction of the Accessible House
    - Duxton Fiberglass frame, triple glaze, 2-low E coatings, argon filled windows
    - Energy Star certified LED lighting will be installed

- **Solar Photovoltaics**
  As well as being essential to achieving net-zero energy performance, the solar component of the NZE program could potentially satisfy household electrical needs during blackouts. The photovoltaic system that will be used in the NZE houses will be sized according to the net-zero energy needs of each house. All NZE houses will be designed so that the necessary solar panels can be installed directly on the roof of the house.

  In the case of the Accessible House, the solar array (i.e. the number of solar panels) is composed of 45 panels, each producing an output of 330 watts, to meet the energy production target of 14,309 installed watts. Electricity production from the solar array will be tied into the Hydro-Quebec electrical grid. Excess power produced through the solar photovoltaic system will be sold to the grid and bought back from the grid when supply from the system falls below household requirements.

- **Heating, Cooling and Ventilation**
  ReNu Engineering designed the HVAC system to satisfy the heating and ventilation needs of the house while ensuring the house can meet the net-zero energy target. The HVAC equipment includes

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- a VanEE 2400 (with an ECM fan) Heat Recovery Ventilator (HRV)
- a Fujitsu Halcyon Mini-Split RLS Air Source Heat Pump
- an AO Smith Proline XE HPTU-66N Hot Water Tank (HWT)

- **Wood Heat**
  The use of wood heat in residential applications in the North is common. Feedback from residents during the initial consultations on housing designs, many residents suggested using a backup wood heating system that will ensure houses can be heated during power outages. A Droulet Blackcomb air-tight wood stove will be installed in the Accessible House.

- **Smart Home Technologies**
  Equipment that will enable occupants to remotely monitor the operation of their homes, including
  - Z-wave enabled smart home accessories that monitor home security, water infiltration, frozen pipes and carbon monoxide
  - programmable smart thermostats

- **Appliances**

Occupants are responsible for obtaining appliances. However, to assist them with this task and ensure that every component in the house contributes to the net-zero energy target for that house, the CNE will give occupants a list of recommended ENERGY STAR® appliances. The recommended appliances must be affordable while also ranking in the top 20% of ENERGY STAR® rated appliances, a performance level that was determined through the energy modelling exercise. This will include a selection of refrigerators, ranges, dishwashers and washer - dryers.

- **Solar Generated Battery Storage**

Presently, the cost of battery storage for the loads required during the coldest winter months is prohibitive. The cost of solar panels has fallen dramatically over the past 5 years and a similar trend is starting to happen with battery storage systems. The CNE will track developments in the advancement of battery storage technology and expects that, over the next several years, the cost of battery storage will fall significantly. Battery storage will be introduced into NZE houses when the technology and the cost justify its use. When battery storage is introduced, it will be sized to provide emergency support to house operations (limited lighting, fridges, freezers) and enable occupants to survive extended power outages.

Energy and IAQ Monitoring Technologies

Net-energy zero houses constructed under our NZE program will be evaluated even after construction in order to validate their net-zero energy performance. The CNE wants to learn as much as it can from its housing projects to continually improve its housing program. The CNE will carry out extensive energy monitoring of each of the initial housing prototypes and a sampling of future NZE houses. Energy monitoring will include

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- blower door testing to confirm air tightness of the building envelope[6]
- detailed data collection over at least one year on energy production from the solar panels
- detailed monitoring of the energy used by occupants, after occupancy, throughout the house including
    - energy consumed by the air-source heat pump and the heat recovery ventilator (HRV)
    - household energy consumption for lighting, cooking, hot water and other uses

For the purposes of the energy monitoring activities to be carried out under its NZE program, the CNE has partnered with the Concordia University School of Engineering's Centre for Zero Energy Building Studies (Concordia). With the technical team, Concordia developed a monitoring protocol and programme and identified the equipment to be used. Measuring the performance of the NZE houses and confirming that they are performing at the net-zero energy standard is a significant component of the performance measurement aspect of our NZE program.

The technologies and equipment for this work are as follows

- Hygrothermal and indoor air quality monitoring equipment including
    - relative humidity and temperature sensors to measure humidity and temperature levels inside the building and its envelope
    - wood moisture content and temperature sensors to determine the moisture level of wood-based materials in the building envelope
    - carbon dioxide sensors to measure indoor air quality
    - a compact weather station to provide local micro-climatic conditions related to temperature, humidity, wind and solar radiation
- a blower door, thermographic camera and other equipment to measure airtightness and detect any perforations in the building envelope
- energy use and production monitoring equipment including
    - a PV energy generation logging device
    - end-use energy use monitoring systems subdivided into heating, ventilation, appliances, lighting and plug loads
    - HRV temperature and flow rate monitoring to determine the HRV efficiency and operation schedule
    - data loggers equipped with backup battery power

In addition to monitoring the performance of the houses, Concordia will carry out research activities on ways to enhance the energy performance of the NZE houses that includes

[6] The Cree Nation of Eastmain NZE program has adopted the "Passive House" airtightness standard (i.e. a minimum air tightness level of 0.6 air changes per hour (ACH) at 50 pascals) as it is considered by net-zero energy builders and energy modellers to be the most rigorous air tightness standard in the industry.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- installing a building-integrated photovoltaic and thermal (BIPV/T) roof system that involves
  - integrating the photovoltaic system into the roofing material of the building envelope to minimize the amount of building material used and enhance aesthetics
  - using the cavity between the photovoltaic roof panels as a duct where outdoor air can be drawn and pre-heated for the HRV indoor air intake and monitoring the increased efficiency of the solar panels from the cooling of the panels
  - using the outdoor preheated air to preheat the ventilation air system
- using the insulated thermal mass of the crawl space for thermal storage
- evaluating the benefits of using an automated shading device on windows facing south, west and east as a way to reduce heat gains and the need for air conditioning in summer.

Monitoring equipment will be placed as follows.

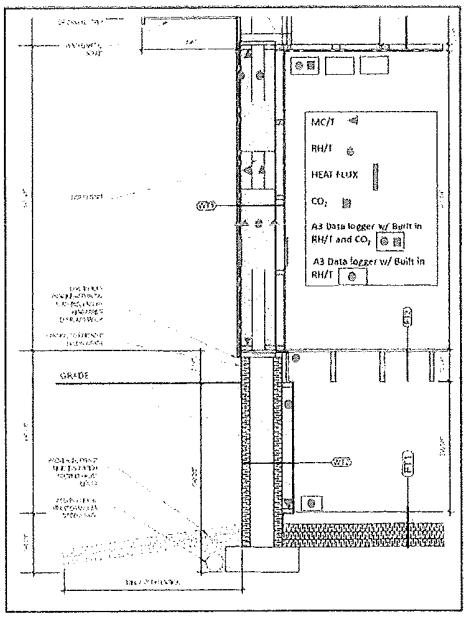


Table 17 – Monitoring Equipment Placement

Location	Equipment
Indoor	A3 wireless CO_2 data logger w/ integrated RH/T (4 resistance channels and 3 voltage channels)
	CO_2 sensor
	A2 wireless data logger w/ built in RH/T and MC
Wall	Point moisture measurement sensor
	RH/T sensor
Attic	A3 NEMA data logger w/ integrated RH/T (4V & 4R)
	RH/T sensor
	Point moisture measurement sensor
Crawl Space	A3 NEMA datalogger w/ integrated RH/T (4V & 4R)
	Point moisture measurement sensor
	RH/T sensor
System	I3 gateway interface
	Building intelligence gateway computer
Roof	Solar radiation sensor
	A2 Wireless Data Logger (with built in RH/T and MC
HRV	Air flow meter
	RTD temperature sensor
	RH/T Sensor
Energy	Watt-hour meter
Outdoors	Weather station

The below figure shows the location inside the house of the performance monitoring equipment.

Figure 5. Wall section sensor layout.

Building System Assembly Technologies

Specific construction equipment and machinery will be used in the facility that will be constructed or rehabilitated by the CNE for the assembly of building components to be used in the new and the retrofitted NZE houses. This equipment includes

- carpentry and cabinet-making tools like cut-off saws, nails guns and drills
- air compressors
- A skyjack or boom truck
- a bridge crane

Approach to Future Proofing Technologies

All of the technologies being employed in our NZE program are standard and commercially available, selected on the basis of quality, energy performance, cost and simplicity of installation and maintenance. At some point, the equipment will need repair or replacement, however other than these normal foreseeable events, no other issues are anticipated.

The biggest technological challenge arises from the absence of any a local skilled electrical or HVAC tradespeople. This will make the installation and replacement of equipment, as well as routine maintenance and repair, very expensive. To address this issue, the CNE will focus on building capacity locally by training local tradespeople on the installation and maintenance of HRVs and air-source heat pumps. However, this is a long-term plan because HRV technicians must complete a 3-year apprenticeship.

Having chosen to use air-source heat pump technology, the CNE NZE program is vulnerable because it will have to rely on external technicians in the event of breakdowns. All houses are at risk of freezing in the event of heating system failure. However, given the low heat loss expected of the NZE houses and the inclusion of a backup wood heating appliance, these houses should be protected against freezing up and occupants will be able to remain comfortably in their homes until the heating system can be repaired.

Legislative Compliance

All applicable codes and standards were observed in the elaboration of the housing designs. The building system meets the structural requirements of the National Building Code of Canada (the "Code"), while dramatically surpassing the energy performance targets of the Code, and complies with other applicable federal and provincial legislation.

Gauging the net-zero energy performance was done using the HOT2000 software developed by Natural Resources Canada (NRCan) and a comparative modelling using the IES VE Energy modelling software. The CNE engaged skilled energy modellers and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

used accepted industry software to evaluate energy performance of the NZE houses and confirm that they will satisfy the net-zero energy targets.

The Government of Canada (GOC) is currently developing a "net-zero energy ready" model national building code as well as a model energy code for existing buildings. The CNE NZE program will satisfy the standards established in these codes and, in so doing, lay the groundwork for other Indigenous communities to create energy-efficient housing programs.

Development of Standards and Guidelines

The CNE intends to use the experience gained during its NZE housing program to create local standards and guidelines reflect the innovative combination of technologies, processes and systems that will facilitate the scalability and transferability of its program.

Interoperability of the Technologies

Several standards and guidelines were relied upon to develop the CNE NZE program and to design NZE houses under this program. The CNE has built on these standards and guidelines to create a program that reflects its reality and responds to its needs and capacities. The various standards and guidelines that the CNE referenced in designing its NZE program and the building systems have resulted in new combinations and interoperability between technologies.

HVAC Design

The design of the heating, ventilation and air-conditioning system (HVAC) for the Accessible House drew upon several standards. The air-source heat pump size was based on the HOT2000 load calculations. Heating and cooling loads will be met by a Fujitsu Halcyon Mini-Split Air Source Heat Pump. The sizing of the HRV and design of the duct system was established to meet CSA F326. Finally, rounding out the HVAC system, the CNE will integrate a high-performance, air-tight Droulet Blackcomb wood stove to provide a backup heat source.

Photovoltaic System

The photovoltaic array was calculated as part of the energy modelling exercise for the Accessible House and is based on the energy production requirements needed to meet the net-zero energy target. It was found that a photovoltaic array producing at least 14,309 watts is required for net-zero energy performance. The photovoltaic array will be made up of 45 panels, each with an output of 330 watts. Under Hydro-Quebec's "Net Metering Rate Option for Self-Generators", each of the NZE homes will be connected to the Hydro-Quebec grid and will use net metering. Under the scheme, the Hydro-Quebec grid will become the "storage system" for excess electricity produced by the photovoltaic system and "sold" to the grid. The amount of energy produced will be deducted from the amount used in calculating the household electricity bill.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Accessible Design

The Accessible House features were designed to meet the accessibility requirements of the Code and applicable legislation. To create the Accessible House design the CNE drew upon the feedback received during community consultations, including caregivers and first responders. Guides and standards referenced in the design of the accessibility features of the Accessible House include the Canadian Standards Association "Accessible Design for the Built Environment" (CSA B651-12) and CMHC's "Accessible Housing Design Guides" (See Annex H).

Scalability and Replicability

The CNE NZE program is shown to be scalable. The designs and technologies are easily adaptable to respond to the different needs and capacities. The CNE has developed a scalable housing program that offers various sizes of housing to a variety of clientele.

The CNE plans to develop a guide setting out the processes for implementation of future net-zero energy initiatives that can be used as a framework by other Indigenous and non-Indigenous communities.

Technology Partners' Roles and Responsibilities

To design and develop its NZE program, the CNE built a team of skilled designers and technicians with extensive experience in the design, construction and evaluation of net-zero energy housing including

- **Bill Semple, NORdec Consulting and Design**
  Bill led the extensive community consultations carried out to gather input on the design of our NZE program housing prototypes and designed the Six-Plex, the Accessible House, the Cree Elders House, the Private Homeownership unit and the Starter House. Bill led the technical team that carried out the evaluation of the construction details, the net-zero energy modelling exercise, and the selection of all materials and equipment to be used in our NZE program. Bill developed the working drawings for the project and will assist in developing the capacity-building program for the NZE project.

- **Peter Amerongen**
  A leader in net-zero residential construction, Peter led the design of the building system and the net-zero energy evaluation. He identified and selected the materials and equipment required to achieve the net-zero energy and will help with the design of the capacity-building and training program for net-zero building techniques and the assembly facility.

- **Homesol Building Solutions**
  Homesol Building Solutions Inc. is an expert in green building and energy design consulting, energy modeling, ratings, labels and has verified building performance solutions for projects throughout North America. It was responsible for the energy modelling and evaluation of the net-zero energy status of the Six-Plex and the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Accessible House. Homesol assisted in the development of the construction details and the selection of mechanical equipment.

- **Concordia University**
  Concordia University's Centre for Zero Building Studies is responsible for the energy monitoring program that will commence with the Accessible House and the NZE retrofit. This will include a breakdown of household energy use patterns including heating, cooling, hot water, appliances, monitoring energy production of the photovoltaic array, monitoring energy production of the air-source heat pump, and monitoring indoor air quality by tracking of CO_2 and humidity levels in the house (See Annex I).

- **McGill University**
  McGill University's Institute of Health and Social Policy will undertake a research project to develop and implement culturally-appropriate research methodologies for monitoring and assessing the results of the NZE housing program at every step. This will include studying the links between housing and individual, family and community well-being (See Annex J).

- **CMHC**
  Canada Mortgage and Housing Corporation provided financial support for the community engagement process and funding for the McGill University research project. In addition, has programs to support ongoing monitoring and evaluation of NZE houses as well as capacity-building. CMHC has acknowledged the importance of the social, financial and technical innovations of our NZE program and expressed interest in the research being carried out (See Annex K).

- **ReNu Engineering**
  ReNu Engineering is an Edmonton company specializing in building performance and energy efficiency. ReNu was responsible for conducting a comparative analysis of different HVAC options and developed the design and conceptual drafting of construction drawings for the selected HVAC system. ReNu also carried out a second energy modelling analysis on the Accessible House to confirm the net-zero energy target using the dynamic IES VE 3D building performance analysis software.

- **Cree Human Resources Development (CHRD)**
  CHRD has funding programs for capacity development that are available to the Cree Nation of Eastmain. CHRD has already contributed financially under its Youth Program that allowed three CNE youth to work with the Project Management Team. The CNE will continue to apply for CHRD funding throughout its NZE program.

ESDC?

Accessibility and Usability of the Technologies

The technologies employed in our NZE program will have a direct and indirect impact on the various stakeholders who will have access to the technologies and the data collected by these technologies.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Builders and local tradespeople will be trained in net-zero energy building systems. By participating in the construction of NZE houses, builders and tradespeople will gain first-hand knowledge and net-zero experience. The repetitive application of the net-zero energy construction techniques should lead to a reduction in housing construction costs.

The HVAC Contractor will be introduced to the installation and use of air-source heat pumps and high efficiency HRVs. The air-source heat pump was selected because of its usability and ease of installation and maintenance.

Occupants will be introduced to and be given assistance on the use of the different technologies used in the NZE program. More particularly, occupants will learn to use programmable thermostats and smart home accessories to monitor home security, detect water leakage and track carbon monoxide levels, and online tracking of their energy consumption patterns and energy production through a dedicated website.

If occupants give their consent, the Housing Department may provide on-site support for remote monitoring carried out on the houses such as rebooting computers, changing batteries in the monitoring equipment as needed and mitigating risks. Furthermore, the Department may have access to monitoring equipment and data collected including energy monitoring data, production data and will have access to material cost breakdowns.

Identification of Risks

Data Security

To ensure data integrity, the NZE program data collection system will be able to operate as a stand-alone system to protect the security and integrity of the data without requiring third party analytics software.

There are measures that can be implemented to ensure data integrity and protect it from unauthorized access. Data collected will be communicated to a cloud-based server for analytics and will use a Secure Socket Layer (SSL) to maintain an encrypted link between the web server and browser. Custom access levels to the data can be given such as, read/write to authorized personnel and read only access for open data sharing.

CHAPTER 5: GOVERNANCE

Good governance practices and guidelines are essential to ensuring that government actions are fair and responsible and carried out in an open, transparent and accountable manner. The CNE adheres to good governance principles.

Governance Frameworks and Strategies

The CNE was a signatory to Canada's first modern-day treaty and a number of subsequent agreements reaffirming its right to self-government and to control its land and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

assets. These agreements together provide long-term predictability of funding to the Cree Nation of Eastmain.

Council is the local government authority and has responsibilities set out in the Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada and the Constitution of the Crees of Eeyou Istchee, as well as under the Cree laws enacted pursuant to these instruments.

ISO/IMS

According to the World Bank, good governance "entails sound public sector management (efficiency, effectiveness and economy), accountability, exchange and free flow of information (transparency), and a legal framework for development (justice, respect for human rights and liberties).[7]" In accepting this definition of governance as one of the underpinnings of community success, the CNE has integrated the spirit of the Smart Cities Challenge. If the CNE promises to adhere to the principles of good governance, it must systematically govern itself. Its strategy, direction, and oversight will only be as effective and as functional as the management systems used to deploy them.

Its acknowledgment of the need for sustainable programs, capable of providing value to the community over time, incited the CNE to develop its ISO Integrated Management System (ISO/IMS) to manage the future growth and challenges of the community. The ISO/IMS provides clear direction and continuous feedback to decision-makers and sets a foundation for trust in the operations of the Cree Nation of Eastmain.

Cree Nation of Eastmain's Smart Cities Challenge governance approach is to integrate the NZE program into the design and development of its ISO/IMS in order to capture its ability to deliver reproducible quality outcomes with a measured degree of reliability. Lessons learned throughout the project, captured as best practices, will be systematically incorporated into NZE program documentation.

Because it is composed of system "modules", the ISO/IMS processes can all be captured and prioritized and implemented in a phased approach to help ensure the appropriate controls, such as transparency, privacy, and accessibility are in place as and when needed.

Through an iterative development approach that sets up the Smart Cities project processes to be executed, together with the capture of their relative performance for continuous improvement purposes, CNE will be developing a turn-key model of not only the housing solution itself, but also of the governance and management systems models that enable them to be sustained.

CNE's governance framework model employs the discipline and traceability of three distinct management systems:

[7] United Nations Economic and Social Council Committee of Experts on Public Administration Fifth session New York, 27-31 March 2006 Agenda item 5 —Compendium of basic terminology in governance and public administration E/C.16/2006/4 *Definition of basic concepts and terminologies in governance and public administration*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- ISO 9001 Quality Management System (QMS) to ensure that CNE meets its community members' infrastructure needs as well as of the SCC solution itself
- ISO/IEC 20000-1 Service Management System (SMS) for the IT services supporting CNE and SCC
- ISO/IEC 27001 Information Security Management System (ISMS) for the protection and monitoring of CNE's information, data, privacy, security, and accessibility.

These systems are enabling CNE to plan, deliver, verify and improve on projects, programs and services. Under the ISO/IMS, the CNE is required to capture stakeholder needs and requirements when designing and developing of any new initiatives, like the Smart Cities Challenge, by using best practices and continuously seeking opportunities for improvement. As an audited, documentation-based system, the ISO/IMS will provide substantiated evidence of the project, from start to finish, making it packageable, transferable and reproducible.

Integrating an ISO/IMS into the SCC is not only novel and innovative in terms of its application of use in this context, but also in terms of its ability to enable CNE to capture and replicate this project to share with other communities. This unique approach will also enable an appropriate level of oversight over the SCC work processes to ensure success at every stage of its implementation. This level of risk management and pursuit of continuous improvement serves as a predictive indicator of failure-causing events, which in turn, makes them easier to avoid.

An investment into a systematic approach at capturing future value in best practices that have been developed within a local community can multiply the beneficial effect across other communities, with structure, discipline, accountability, transparency and quality housing.

Cree Laws and Policies

In this respect, the CNE must comply with the procedures set out in its financial and administrative laws with respect to expenditures and contracting. Budgets must be prepared by the Treasurer and approved by Council. Monies to be allocated to services and programs must be included in the budgets or supplementary budgets and approved by Council resolution. With the exception of borrowing for housing, long-term borrowing must be approved by Council and ratified by the electors of the Cree Nation of Eastmain.

Each year, the CNE is subject to audit of its financial statements. The auditors conduct an extensive examination of Council resolutions, contracts, purchase orders and payments to ensure that spending is done in compliance with the Cree law.

Activities under our NZE program that involve an expenditure of funds must use administrative and financial management tools that ensure the good financial management of resources. These tools include templated contracts, purchase orders, and budgets and financial statements on a project-by-project basis.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Management

Under our NZE housing program, Council and the Project Management Team will review program needs and make decisions on project funding on an annual basis and as needed to respond to program requirements. The Project Management Team will have an obligation to report to Council and to the members on the use of Cree Nation of Eastmain's NZE program contributions. All such reporting will be done at public meetings to ensure the transparency of the NZE program activities and enhance the accountability of the Cree Nation of Eastmain.

Our NZE program governance framework will be made up of a two-tier project management system. One tier will manage the NZE program and provide technical support, the other will manage project construction activities and costs. The purpose of this structure is to minimize risks and improve chances of success. All construction projects will be supported by a team of experts making sure that construction can be completed on time and on budget.

The Project Management Team will be responsible for

- obtaining funding for the NZE program and construction activities
- carrying out all design review and changes
- evaluating and approving all change orders
- overseeing all aspects of the NZE program.
- evaluating the project to ensure compliance with building code and other standards
- tracking all materials, orders and costs as well as labour costs
- developing the capacity-building program and overseeing its implementation

The construction project manager will be responsible for

- tendering and contracting with contractors
- establishing and undertaking a material inventory control system
- undertaking the assembly of building components to avoid seasonal impacts
- ensuring construction projects are started and completed on time
- monitoring contract performance
- providing proper site supervision
- controlling costs

Partners and Resource, Capacity, Roles and Readiness

The CNE will work closely with its partners Concordia University, McGill University, Renu Engineering, Canada Mortgage and Housing Corporation (CMHC) and Cree Human Resources and Development. The partners' roles in our NZE program is determined by their respective sphere of activity and expertise. Each of our partners has the capacity needed to contribute to the success of our NZE program.

Concordia University will carry out all the quantitative data collection as well as the storage and protection of this data. McGill University (McGill) will collect qualitative data relating to occupant experience and will also be responsible for the storage and protection of this data. McGill will ensure that data it collects under our NZE program is anonymized prior to disclosure to our program partners or any third party

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CMHC has approved a three-year project for the CNE McGill to carry out qualitative research on the occupants and resident's response to the NZE houses and NZE retrofits. The Contribution Agreement has been approved in principle with wording relating to intellectual property rights and privacy to be finalized.

Concordia University

Concordia University Department of Civil and Environmental Engineering's Centre for Zero Energy Building Studies (Concordia), is one of the leading research institutes on net-zero energy buildings in Canada. Dr. Andreas Athienitis, Director of the Centre and Scientific Director of the Natural Sciences and Engineering Research Council of Canada (NSERC) Smart Net-Zero Energy Buildings Strategic Network, is known at home and abroad for his work promoting net-zero energy buildings. His extensive work in this area has enabled Concordia to build significant capacity in this field, with several professors and graduate students specializing in net-zero energy and solar buildings. Concordia will carry out extensive field monitoring of the houses built under the CNE NZE program which will serve as a model for a framework that can be replicated in other northern communities. Field testing will be carried out by Concordia graduate students, supported by Dr. Athienitis and Dr. Hua Ge.

McGill University

Qualitative research on our NZE project will be carried out by the McGill Department of Geography Institute for Health and Social Policy's Place, Health and Well-being Research Group. Led by Dr. Mylene Riva, Assistant Professor at the Institute and the Department, the research group will examine the social and environmental determinants of health and well-being among Indigenous and non-Indigenous peoples. The extensive field research to be carried out in Eastmain, will build upon a previous project carried out in Nunavik on Housing, Health and Well-being in the Artic. The research activities will be undertaken by graduate students from the Department under the supervision of Dr. Riva. The research work will examine the links between housing and individual, family and community well-being.

Control over Sensitive and Personal Data

The CNE and its partners are all responsible for compliance with data protection and privacy obligations.

Data collected in the context of our NZE program will remain the intellectual property of the Cree Nation of Eastmain. The public disclosure of any such information requires the Cree Nation of Eastmain's prior consent.

Any disclosure of information collected under the auspices of our NZE program must first be anonymized and all personal identifying information removed. The CNE intends to enter into memoranda of understanding with its partners, and other person involved in our NZE program, to ensure compliance with the Personal Information Protection and Electronic Documents Act (PIPEDA).

Risk Management

Below are some of the risks relating to governance that have been identified along with the steps take to avoid these risks or to remedy them.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 18 – Risk Identification, Prevention and Correction

Risks	Preventive Measures	Corrective Measures
Changes in Council priorities that negatively impact funding commitments for NZE program	Keep Council informed of benefits of NZE program and its importance	Seek additional investment and financing.
Changes to government policies		Adjust the project according
Contract disputes	Ensure effective supplier/contract management is in place	Bring the interested parties together to mediate a solution
Partner withdrawal from the program	▪ Good leadership ▪ Healthy communications to identify issues early ▪ Effective engagement	Establish new partnerships

CHAPTER 6: COMMUNITY ENGAGEMENT

Approach to Engagement

In order to enhance the success of its Housing programs, the CNE is working toward increasing the residents' understanding of its Housing Policies and programs so that they can fully take advantage of these. The Housing Policies are currently being reviewed and during this process, ongoing discussions, information sessions and workshops will be used to educate and gather input from residents on these policies. Community engagement has always been the preferred method for the Housing Department to obtain feedback and ideas from Eastmain residents. Key strategies that we have used to support the Cree Nation of Eastmain's efforts to inform and educate residents include

- developing a Tenant Guide Booklet to be provided to every household
- holding information sessions and workshops for community members on Home Ownership and Tenant Responsibility
- doing monthly Radio Talk Shows on Housing matters
- organizing CMHC-sponsored workshops for tenants and maintenance workers on mould issues, indoor air quality, basic home maintenance, and Section 95 Housing.

Cree Nation of Eastmain's Sustainable City Challenge Statement, "Improving Community Well-Being", evolved from a series of meetings between Chief and Council and the CNE Housing Committee, and numerous informal and formal discussions with elders and other residents. During this engagement process, the CNE became acutely aware of the ongoing issues that residents have with housing designs, construction standards and the operations of mechanical systems. As such, broader consultation was carried out on these issues at community meetings, design workshops and home visits. Community events included

- Workshops/Charrettes (2017 and 2018)
- Annual General Assemblies/Cree Café (2017 and 2018)

pre-plant

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Meetings/consultations with users (tenants and occupants), and professionals (caregivers, first time responders etc.)
- Special Events
  - Housing Forum (2018)
  - Builders Forum (2018)

Consultations, home visits and workshops were held in June 2017 with the focus of gathering residents' ideas on the design of various housing prototypes. This initial consultation process was followed up by workshops in January 2018 where preliminary plans for the Cree Elders House, the Starter House and the Six-Plex were presented, and residents were invited to comment on these. Consultation was held in the summer of 2018 on the design of the Accessible House.

Annual General Assemblies

The CNE holds regular Annual General Assemblies (AGAs) to receive members' ideas such as topics on ways for improving housing in the community. Break-out groups during the AGAs allow smaller focus groups to explore questions in greater depth.

At the 2017 meeting, the Housing Department presented designs for a Cree Elders' House (Annex L), an Elders' Community (Annex M) and a Starter House (Annex N). A housing booth was set up so members could review the preliminary plans, ask questions and comment on the house designs. The CNE received positive feedback on the designs. Members also expressed their desire to see more durable and energy-efficient homes built in the community. The incorporation of culturally-appropriate features, the installation of solar panels and the use of thicker, better insulated walls were a starting point for further discussions around making houses more sustainable.

this was evident in ch. 1 & 2

CNE Housing Forum

In February 2018, as a continuation of the community engagement process, a Housing Forum, with a focus on obtaining members' input on CNE housing needs and the Smart City Challenge, was held. The Housing Forum was devised to enable the sharing of information and gather members' input on the Smart Cities Challenge, the Cree Nation of Eastmain's proposal to create an NZE Housing Program and the preliminary design for a culturally-appropriate NZE Six-Plex.

[redacted]

Reflecting a trend that is emerging in many northern Indigenous communities, multi-unit housing is being promoted as a means to reduce land development and construction costs, improve energy efficiency and enhance the sustainability of the community. The Housing Forum gave members information and a chance to exchange ideas on

- the Smart Cities Challenge
- the proposed NZE housing program
- energy efficiency targets, technologies and the building systems used to reach these targets

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- lessons learned from other successful NZE projects in Canada
- the challenges facing remote northern communities in attaining NZE targets and their relationship to the traditional lifestyles
- housing design ideas and principles with respect to the proposed culturally-appropriate Six-Plex
- community resiliency and the impact NZE housing can have
- the importance of capacity-building and training to create a sustainable housing program
- the cost/benefit of an NZE program for the Cree Nation of Eastmain
- smart home technologies
- housing maintenance
- views of local builders on NZE building systems

After significant discussion, the CNE members adopted a Resolution supporting CNE's participation in the Smart Cities Challenge. (Annex O) This included the implementation of an NZE Housing Program and the construction of an NZE Six-Plex (Annex P). After the Resolution was adopted, community members were divided into four discussion groups where they provided more detailed input on the Smart City Challenge and the CNE NZE Housing Program.

Cree Cafes and Targeted Consultation

The ongoing use of the Cree Cafés during AGAs and community meetings has led to design innovations and gives residents a means to voice their ideas and share their experiences in respect of housing. It was through this process that the net-zero housing initiative was developed. Input was also sought from service providers in the health care and public safety sectors and, with the ideas of residents, informed the development of several culturally-appropriate housing designs that reflect on the Cree way of life.

Cree Café focus groups broke out during the Housing Forum to discuss questions related directly to the Cree Nation of Eastmain's development of the Smart Cities Challenge proposal. The discussions at the Cree Café confirmed strong support for a net-zero energy housing program, improvement of housing design, durability and operating cost. In particular, there was significant support for

- more design options for homes that will give residents greater opportunity to participate in housing design and that meet the needs of different members
- exploring pre-fab construction that would give the CNE more control over the quality of construction and lead to the creation of more local employment
- home monitoring to help protect homes against break-ins and equipment breakdowns when members are out on the land or travel down south.

The CNE recognized early on during the Smart Cities Challenge community engagement process, that engaging with local builders, to get their input and support, was essential to the success of the project. As part this process, an initial consultation session was

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

facilitated by design and technical consultant, William Semple, and net-zero energy consultant, Peter Amerongen, in October 2018. The presentation made to local builders during this consultation session provided information on house designs, the proposed building system, costing, capacity-building issues and the targets for the project. Local builder consultation sessions were used to gather feedback and initial impressions of the NZE program and the challenges and opportunities it would present.

Builders' Forum

Building on the first local builder consultations, an Eastmain Builders' Forum was held in December 2018. The Forum brought together local builders and tradespeople, housing inspectors and representatives from the construction materials supply chain with a view to ensuring the comprehensive representation of the building industry on the NZE program. The CNE took the opportunity to affirm the importance of the participation of local builders and suppliers to the success of the NZE program. More particularly, they were informed that a collaborative and cooperative approach must be taken if the NZE program is to address the ongoing issues with residential construction costs in Eastmain. This further reflected the CNE view that success and sustainability of its NZE program required a holistic approach and the buy-in of all stakeholders.

The Builders' Forum included an overview of the Smart Cities Challenge and the Cree Nation of Eastmain's proposal to establish a net-zero energy housing program to respond to its housing shortage. Participants were presented with the house designs and the proposed building system and technologies.

Builders and industry representatives in attendance expressed strong support for the NZE program and its goals of constructing more, better-built and resilient housing, creating employment and economic development opportunities and building housing industry capacity in Eastmain.

Eastmain Partners Meeting – Concordia University

In January 2019, the CNE and its partners and interested government agencies participated in a two-day meeting and planning session at Concordia University. In attendance were potential funding agencies, research partners and the CNE Smart Cities Challenge team. Presentations included

- CMHC northern housing research projects
- NRC northern research projects
- McGill University social northern housing research in Nunavik
- Concordia University Centre for Zero Energy Building Studies research projects and the NSERC research network

The session also

- developed linkages between the social and technical researchers and research projects

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- provided an overview on the Eastmain Smart Cities Challenge proposal and long-term objectives of the community
- provided an opportunity to contribute to the development of the research objectives of the research partners and input into the development of the final proposal

Community Engagement Plan – Project Implementation

As part of its ongoing consultation process with its members and to support the Smart Cities Challenge initiative, the CNE will carry out ongoing consultation with members and other stakeholders. In addition, the CNE will share NZE program progress and outcomes, and continue to obtain feedback from residents on the NZE program, including the important cultural aspects addressed in the design of the houses. The Cree Nation of Eastmain, in partnership with its research partners, will launch initiatives to gauge the impressions of residents living in NZE houses, with respect to their designs, and the roll out of the construction of NZE housing in the community.

culturally appropriate CHR

To ensure that Indigenous values, traditions and experiences guide the research, the research project will be conducted according to the principles of Indigenous Research Methodologies (IRM), using research methods for community-based participatory research (CBPR) to engage with Eastmain residents. Using the participatory research model, the McGill University research team will work in collaboration with the CNE. The partners will contribute to the various phases of the research, especially in defining the research questions and objectives, developing the methodologies, data collection and analytical processes, and disseminating the research results. Participatory research will include validation steps at every stage of the NZE program.

For this research to be culturally-sound and grounded in Cree lived-experience, it will engage with Cree worldviews, knowledge and idioms, with a focus on the central role that relationships play in Cree culture. The McGill University research team will conduct one-day workshops with groups of 6 to 12 participants, ensuring representative demographic groups that include women, men, elders and youth. Following the IRM principles, talking circles will be used as a culturally-appropriate way to exchange ideas and bring together varied perspectives on complex subjects. Talking circles will allow the McGill University research team to obtain a comprehensive understanding of the Cree perspective of relationships and how these are impacted by housing conditions and design, and how these housing conditions and designs impact individual, family and community health and well-being.

The IRM principles will guide the research aspect of the NZE program, and data collection methods will be carried out in collaboration with the CNE. The research project will document

- housing conditions and well-being of individuals, families and of the community at "baseline"; i.e. before the implementation of the NZE housing program
- the change in housing conditions, after the implementation of the NZE housing program (i.e. impact assessment of the NZE housing program)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- the impacts on occupants arising from the change in tenancy and occupancy of a new NZE home or NZE retrofitted unit
- culturally-appropriate and NZE design vs. housing presently available
- NZE retrofitting houses vs. moving into a newly-built house, vs. moving into an existing house in the community made available when other residents move into private homeownership houses

Eastmain Community Housing Meeting (May 2019)

Once the winners of the Smart Cities Challenge is announced and prior to launching the NZE housing program, the CNE will hold a special community meeting and information session. The meeting will provide information on the proposed roll-out of the NZE program including

- a detailed overview of the Cree Nation of Eastmain's final proposal for the Smart Cities Challenge
- the final designs of the houses to be constructed under the NZE program
- a detailed overview of the NZE construction projects to be carried out in 2019
- the proposal respecting the establishment of a warehouse/building component assembly facility
- the project management plan and the proposed timelines for the NZE program

Eastmain Annual General Assembly (August 2019)

At its 2019 AGA, the CNE will provide an update on the results of the Smart Cities Challenge and the roll-out of NZE housing program. A presentation of final drawings and 3-D models of the Accessible House being constructed at the time of the meeting, and the Six-Plex to be constructed in 2020. The information on these construction projects will include (a) the building system, (b) the plans for local assembly of building components, and (c) the net-zero energy monitoring of the projects. The AGA will serve to collect members' feedback on

- proposed project roll-out and construction timelines
- capacity-building and training components and their impacts on local employment
- proposed project monitoring and data collection

Builders Meeting/Workshop (Autumn 2019)

A one-day interactive workshop will be held late in Autumn 2019, after the completion of the Accessible House. The session will include those builders and tradespeople that worked on the Accessible House project. The workshop will consider and make recommendations on

- building system costs, ease of construction, changes or alterations
- pre-assembly of the wall system

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- integration of the trades into the production of the house
- evaluation of the material ordering/storage
- capacity-building and training

Eastmain Community Housing Forum (Autumn 2020)

A one-day Housing Forum will be held in Autumn 2020, after construction has commenced on the first Six-Plex project. The Forum will allow the CNE to get members' impressions on the design of the NZE houses, share results of year-1 monitoring and inform them of the progress of the warehousing and building component assembly facility.

The extensive community engagement initiatives that the CNE has taken on with the NZE program are reflective of the community's ongoing commitment to engage and consult with its residents on important community issues like housing. While the CNE's aspiration to combine the construction of multi-unit homes with NZE performance, culturally-appropriate designs and features is unique and ambitious, the CNE believes the project is achievable – and that extensive community involvement in the project is an important component in ensuring its success.

CHAPTER 7: DATA AND PRIVACY

Preliminary Privacy Impact Assessment

The CNE prepared a Preliminary Privacy Impact Assessment (PIA) showing the consideration it gave to the collection, use and flow of information (See Annex Q). The PIA was sent to the Office of the Privacy Commissioner of Canada for comments. These comments[8] have been considered in the elaboration of the Cree Nation of Eastmain's activities that touch data protection and privacy.

Compliance of Data Management Plan with PIPEDA

Privacy and the NZE Program

The NZE housing program will involve the collection, use and retention of personal information, of varying degrees of sensitivity. The information collected includes inter alia the below information (Table 19)

[8] The comments are attached together with Annex R.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 19 – Information Collection and Purposes

Information	Purpose
Name	Identification
Family Size	Allocation of appropriate housing
Address	Identification
Total household income	Determine rent
Health conditions (if any)	Determine special housing needs
Rental arrears	Determine eligibility for new housing and/or subsidies
Loan information	Confirm ability to pay and eligibility under Private Homeownership Program
Credit rating	Verify capacity to pay rent

In collecting this information, the CNE intends to comply with fair information principles.

Pursuant to the Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada and the Constitution of the Cree Nation of Eeyou Istchee, the CNE must establish access to information procedures with respect to information in its control. The CNE is implementing a process for classifying information and establishing the level of protection required.

Presently, CNE agreements with suppliers, contractors and consultants contain provisions respecting confidentiality and, with respect to service providers, retention and disclosure restrictions.

With respect to the NZE housing program, both Concordia University and McGill University[9] are subject to their own privacy policies and to the Quebec Act respecting access to documents held by public bodies and the protection of personal information, CQLR ch A-2.1. Concordia University's Office of Research will provide guidance to the CNE to ensure research conducted under our NZE program complies with all applicable legislation and policies. A Summary Protocol Form will be submitted to the Concordia University Human Research Ethics Committee (UHREC) to obtain a Certificate of Ethical Acceptability before undertaking any monitoring of any occupied houses. Annual progress reports will be submitted to UHREC to obtain approval of the research privacy and data protection protocols throughout the monitoring phase.

A consent form that contains a plain language description of the project and any possible privacy risks will be given to occupants as part of the consent process.

Methods of Data Collection, Analysis and Storage

The CNE has held public meetings with its members to design the NZE housing program. As well, housing continues to be tabled at public meetings. Members are informed regularly of the information requirements for housing in general, which includes much of the information set out in Table 19.

[9] McGill University is subject to the Tri-Council policy Tri council policy statement http://www.pre.ethics.gc.ca/eng/policy-politique/initiatives/tcps2-eptc2/chapter9-chapitre9/

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

New regional policies will be coming into force and the NZE housing program will involve further consultation with members to ensure comprehension of the additional information requirements of the regional policies. The CNE will also inform members of the type of information that will be required and the purpose of collection of information under the NZE program. Prior to the collection of information, the individual is informed of the reasons for which the information is collected, how it will be used and whether it will be shared with other organizations.

Table 20 – Non-personal Information Collection and Purposes under NZE Program Monitoring

Information	Purpose
House Model/Size	Research
Energy use	Research
Air quality	Research
Comfort	Research
Satisfaction	Research

Collection

The CNE Housing Administrator will collect only that information required for the purposes of administering the NZE housing program and complying with the CNE housing policies and the policies to be adopted by the Cree Nation Government. More specifically, the CNE must, in order to administer its NZE program, be able to identify the occupants, verify their eligibility under the programs and capacity to pay and understand the health conditions, if any, that may be determinative on the type of housing unit allocated to the occupants.

The information collected by Concordia University and McGill University is necessary to enable the analysis of the net-zero energy technologies, construction systems and to measure the success and individual satisfaction with the NZE homes to be built in Eastmain.

Use, Disclosure and Retention

The information collected by the CNE will be used exclusively for the purposes of administering its housing program; i.e. allocating housing units, fixing the rent to be paid and establishing maintenance schedules, amongst others. Information collected by Concordia University and McGill University will be used solely for research purposes.

The information collected by the CNE will not be disclosed to third parties except as required by policy. Disclosure to the Cree Nation Government may be required under CNG policies and funding arrangements with the CNE, so that the occupant or the CNE can access subsidies for housing. Otherwise, the CNE will not disclose information collected from members for the administration of its program to third parties.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The CNE will however collect information generated by the sensors and data loggers. This information will be anonymized and then transmitted to Concordia University for the purposes of monitoring the performance of the NZE houses. McGill University will be responsible for collecting information directly from occupants of NZE houses and Eastmain residents with respect to the qualitative study it will conduct.

The information collected under this study will not be disclosed to third parties, including Cree Nation of Eastmain, until it has been anonymized.

Depending on the housing program, and the type of information collected, information collected for the purposes of administering the housing program is held for the duration of the housing project (i.e. until final payment) or until it is no longer relevant (such as a change of occupant).

McGill University may retain information for up to 20 years under its policies. This information though will be in an anonymized format.

Security and Privacy Considerations

The CNE is implementing information and data management protocols to ensure that personal and confidential information are properly collected, managed and stored. Given the feedback from the Office of the Privacy Commissioner, the CNE will require partners to enter into agreements that provide for the protection of personal and non-personal confidential information.

Adherence to Fair Information Principles

Governance

The CNE is committed to ensuring that personal and confidential information collected under its NZE program is treated in compliance with the Personal Information Protection and Electronic Documents Act. The CNE is implementing an Integrated Management System auditable to ISO Standards; 9001:2015 Quality Management; 20000-1:2011 Information Technology Service Management; and 27001:2013 Information Security Management.

It is also noteworthy that developing a privacy and data protection policy is a priority of the CNE. Recognizing the vast amounts of personal, employee, business and confidential information it handles regularly, the CNE plans to ensure that information is properly classified. Classification of the information it collects, uses and processes will ensure that, through policies, the CNE can establish the appropriate protection of that information and define access and disclosure restrictions.

Ownership and Control

Personal information required under its housing program will be owned and controlled by the CNE. In fact, where third party services are required to process the information, the CNE standard contracts contain clauses ensuring that any information obtained or

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

processed by the third party remains the property of the CNE. More importantly, the information cannot be accessed directly by the third party on the CNE information system without first obtaining the necessary authorizations. The authorization is given in the form of a letter that must set out the purpose of the access and the period of access.

In the NZE program, the CNE will also retain ownership and control of the data generated by the sensors and data loggers installed in NZE homes for monitoring purposes.

Consent

The CNE collects and holds information relating to members under other programs, including member benefits and elections. However, there is no information sharing between departments and programs unless the member expressly consents to disclosure of this information.

The name and address of occupants as well as information relating to membership are generally publicly known given the size of Eastmain. While the CNE may have a general understanding of certain health conditions, this information must be obtained directly from the individual or, if incapable, from that individual's caregiver with express consent.

Under the NZE program, CNE will only collect information from occupants of NZE houses or NZE retrofits, as required by the regional and CNE housing policies. This involves collecting personally-identifying information and information relating to occupants' financial situation directly from occupants. Prior to collecting this information, the CNE will ask occupants to consent to the collection of their personal information, using a consent form developed for the Housing Department needs. Pursuant to CNE practices, occupants must also consent specifically to the further sharing of information.

Occupants of NZE houses and NZE retrofits will also be asked to consent, on a voluntary basis, to the collection of information generated by the sensors and data loggers installed in the NZE houses and retrofits and will be told the purpose of such collection. Consent must be given in writing and will be related solely to the research conducted by Concordia University. The information will include addresses and other personally-identifying information collected by the CNE.

Concordia University will also request the consent of occupants participating in the NZE program monitoring. The consent form will explain in plain language that consent is given on a voluntary basis, with the option to withdraw at any time.

McGill University will collect information through one-on-one interviews, surveys and questionnaires. Occupants of NZE houses will be given a questionnaire each year. All collection and use of the data obtained through these methodologies will be subject to the consent of the occupant and McGill University must pass all research by the Ethics Committee to ensure that it conforms to McGill University's policy on protection and retention of personal information[10].

[10] *Ibid.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Data Minimization and De-identification

Information relating to energy use and production is non-personal information generated by the sensors and data loggers installed in NZE homes and retrofits and will be collected by the CNE Housing Department. The information will include the addresses of the homes, but this information will be removed before transmission of the non-personal energy use information. The CNE will anonymize all information before it is transmitted to Concordia University for the purposes of its study.

Access

Because personal information is collected for the purposes of administering the NZE housing program, it is important that it be accurate and up-to-date. Under CNE policies personal financial information must be updated every two years to ensure its accuracy. Individuals may also periodically update or modify their information by making a request to the Housing Department.

Under the Constitution of the Cree Nation of Eeyou Istchee, the CNE must set up a process to respond to access to information requests. This will include identifying the person who will respond to such requests. Presently, members attend the CNE administration offices to request access to information and documents held by the CNE.

Individuals may access information pertaining to them to ensure its accuracy and make corrections. Generally, this is done directly with the department holding the information.

Security

The information held by the Housing Department is kept in locked cabinets and password-protected computers to ensure information is adequately protected and can only be accessed by those administering the housing programs.

The CNE is sensitive to the need to protect the privacy of residents. By classifying information and setting access rights accordingly, it will restrict access to personal information it receives from occupants under its housing programs.

All information collected by McGill University will be anonymized. The names of study participants will be kept in separate password-protected files. Each participant will be attributed a number to prevent their identification. McGill University is alive to the risk that some participants will be readily identifiable solely on the basis of their comments or responses and will look for ways to mitigate. All information is kept in a password-protected computer in a research lab that can only be accessed with a code.

The NZE houses will be equipped with connective technology allowing Concordia University to monitor and measure field data and performance data. The data generated through the monitoring equipment will be sent by the CNE to Concordia University using Secure Socket Layer (SSL). This will ensure an encrypted link is maintained between the web server and browser and prevent cybersecurity breaches that would put the data at risk of unauthorized access or unintentional disclosure.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Open Data Strategies

The CNE has embraced an open, transparent data strategy aimed at ensuring ongoing communications with Eastmain residents on the NZE program. The level of consultation and community engagement has been extremely high and will continue under the NZE program.

Open data strategies will ensure that Eastmain residents have access to the results of the studies being conducted by Concordia University and McGill University.

Through smart technologies installed in NZE houses, occupants will have access to information relating to their energy use and production, energy use patterns and indoor air quality of their houses. These technologies are commercially available which means that they are easily transferable and reproducible in other projects and communities.

Risks

Table 21 – Risk Analysis

Risks	Preventive Measures	Corrective Measures
Accidental/intentional disclosure of personal information	Keep hard copy information in a secure, locked location Password protect computers and computer files	Inform occupants of breach Impose secure storage and password protection protocols
Identification of occupant from responses to McGill questionnaire	Phrase responses to avoid identification Explain to respondents the risk of identification	Remove response from published study
Accidental/intentional disclosure of health information	Keep hard copy information in a secure, locked location Password protect computers and computer files	Inform occupants of breach Impose secure storage and password protection protocols
Accidental/intentional disclosure of financial information	Keep hard copy information in a secure, locked location Password protect computers and computer files	Inform occupants of breach Impose secure storage and password protection protocols
Decision-making based on out-dated or inaccurate information	Ensure information is updated regularly Ask occupants to provide updated information	Correct information

CHAPTER 8: FINANCIALS

The CNE has extensive experience in managing capital projects, from securing funding and managing costs, to completion of various multi-million-dollar projects undertaken over the last ten years. Projects included construction of public facilities, infrastructure and housing. CNE benefits from some of the most up-to-date technologies to manage its projects including GIS, Accounting and Cost Control Systems, Preventive Maintenance, Project Management and Document Management Systems, that are linked together to improve efficiency. Our IT systems will soon be updated to a hyper-converged infrastructure that permits multiple servers to act as one which improves scalability, data protection, management, maintenance and operational activities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

As a Cree local government, the CNE is required to follow the Canadian public sector accounting standards prescribed for governments as recommended by the Public Sector Accounting Board of the CPA Canada with exceptions of certain requirements as agreed by Canada and as detailed in our annual Independent Auditors Report. CNE management is responsible for the integrity and objectivity of financial statements and for implementing and maintaining a system of internal controls to provide reasonable assurance that reliable financial information is produced. CNE's Council is responsible for ensuring that management fulfills its responsibilities for financial reporting and internal controls and is ultimately responsible for reviewing and approving the financial statements.

Local companies in Eastmain, working with external skilled tradespeople for plumbing, electrical, heating and ventilation, will be constructing and retrofitting the NZE units. The CNE will be responsible for securing all funding and issuing contracts to Stajune Construction for project management and cost control of the construction works on a fixed-cost basis throughout the program. The CNE will also be responsible for monitoring the overall NZE program, risk management, the purchasing and negotiating with suppliers for all construction materials and the control of inventory.

Project Budget

Funding for the CNE NZE program has been secured, with the exception of the Smart City Challenge winner's prize, and revenues generated from the sale and leasing of housing units. The CNE will continue to apply under any funding programs that can benefit the NZE program.

Revenues

Details of our secured and projected revenue sources are as follows

- **Cree Nation of Eastmain**
  The CNE will contribute up to $5M from its Local Economic Development Fund over a six-year period for the NZE program activities, matching the SSC prize if CNE is chosen as the winner
- **Infrastructure Fund**
  Funding comes from an annual subsidy provided to the CNE through the regional government for housing and infrastructure purposes
- **Housing Action Plan**
  These funds are received from the regional government for urgent mould remediation and housing renovations
- **Regular Program Subsidies**
  Grants from the regional government help off-set the high costs of construction in Eeyou Istchee
- **Smart City Challenge**
  The prize awarded to the winner of the Smart Cities Challenge $5M category

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **Sales and Rent**
  The monies received from the sales of the NZE private homeownership houses and the monthly rent collected from tenants occupying rental housing units
- **Training and Development**
  Revenues secured by the CNE to date from outside sources that have programs designed to build capacity in Indigenous communities

Expenses

Expenses for our NZE program are costed in today's dollars and exclude possible year-to-year inflationary increases that would normally apply to construction labour and materials. The CNE believes that as it gains experience in net-zero building techniques, efficiencies will off-set annual inflation numbers. Also, costing for material was based on northern norms and excludes potential savings that may be generated by bulk ordering materials and establishing and improving CNE's supplier management processes and the relationships within the supply chain.

CNE NZE program projected expenses are

- **Accessible Housing Unit**
  Construction costs for building an Accessible House pilot unit in year-1 of the NZE program
- **Multi-Client Six Plex**
  Construction costs for building 5 Six-Plex buildings over a five-year period between year-2 and year-6 of the program
- **Detached Single Family Unit**
  Construction costs for building 4 single-family houses in year-2 through year-5 of the NZE program (this excludes the pilot Accessible House). Year-2 and year-4 will see a 2-bedroom Starter House built and a 3-bedroom Private Homeownership House will be built in year-3 and an Elders House built in year 5
- **NZE Retrofit**
  Expenses are related to carrying out a net-zero retrofit pilot in year-1 and retrofitting 4 units in year-2, and 5 retrofits each year for years 3 to 6
- **Training and Development**
  These expenses represent the estimated costs for training and work experience programs for construction workers in relation to net-zero building and potential CNE contributions to qualify community members in the skilled trades of plumbing, electrical, heating and ventilation
- **Program Administration**
  These expenses are related to CNE project oversight and personnel required to ensure overall success through continuous program marketing, operational support by technical experts, professionals and applying for additional resources to extend projects beyond the Smart Cities Challenge
- **Solar Technologies**
  The Cost "B" estimate for the Accessible House, based on the energy modeling exercise used to determine the size of the photovoltaic array needed to produce

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

the electricity requirements to reach net-zero status. This number was used to determine the average number of photovoltaic panels per unit being built and retrofitted per year.

2024	$ 537,214.50	$ 537,214.50	$ 1,294,086.00	$ 1,281,127.00	$ 3,649,642.00		$ 3,649,642.00
2025	$ 537,214.50	$ 537,214.50	$ 981,127.00	$ 1,256,127.00	$ 3,311,683.00		$ 3,311,683.00

Class B Methods and Assumptions

As the CNE NZE program is primarily comprised of capital projects relating to construction, the below Figure 9 was used as the basis for construction Class "A" through "D" estimates.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Figure 9. Construction Class Estimates

Class of estimate	Design Estimate Effort	Project Contingency Range (%)		Cost estimate basis	
				Materials	Labor
		(-)	(+)		
A	Finalized (100% complete tender documents)	5%	10%	As for Class B, with material on approx. 100% firm basis	As for Class B, some actual field labor productivity may be available
B	Detailed (66%Design development)	10%	15%	Firm unit cost quotes based on detailed quantity take-off	Estimated man-hour units (including assessment) using expected labor rate for each job classification
C	Preliminary (33%Design development)	15%	20%	Labor/material ratios for similar work, adjusted for site conditions and using expected labor rates	
D	Concept (simplified)	20%	30%	By overall project or by ratio to area or global project unit and comparison with similar work with materials adjusted to current cost indices and labor adjusted to site conditions.	

Estimates were realized by an Indigenous engineering firm involved in Indigenous construction projects and are specialised in construction project management. These estimates were based on completed preliminary design drawings, including definition of major systems and subsystems and outline specifications. These documents were prepared by an Architectural Technician under supervision of the Designer and a net-zero builder. The estimates include documented work breakdown and quantities calculations. Rough material prices used for the estimates were provided by a regional supplier. Mechanical equipment and other material prices were based on budget bids obtained from various suppliers. Realistic assumptions were made on labour productivity. Labour rates were based on rates established by the Commission de la construction du Québec and the estimated ratios of local and external tradespeople. Finally, estimates were cross-checked by using a unit price method based on similar project experiences.

Contributions from other Sources

The CNE NZE program will leverage revenues generated as set out above, other contributions and the Smart Cities prize money to amplify the impact and reach of our program by

- applying for additional provincial and federal funding geared toward enhancing accessibility for persons with disabilities
- obtaining in-kind contributions and/or financial assistance from our partners and government programs including
  - the Concordia University Centre for Net-Zero Energy Building Studies in-kind and financial contributions through funding received from (NSERC) that supports its net zero research projects and initiatives

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- McGill University research carried out under a research grant funded by CMHC under its Research Planning Fund (RPF) (See Annex – Letter of Approval)
- Cree Human Resources Development is subsidizing the salaries of three local youth to assist CNE with project coordination and proposal development
- CMHC is contributing funding under a youth work experience program in relation to research and team environment initiatives via a grant through the Housing Internship Initiative for First Nation and Inuit Youth program (HIIFNIY)(See Annex *)

The CNE's project management team will continually apply to funding programs and other revenue sources to leverage success. This includes any local, regional and national programs that support Indigenous and accessible housing, green technologies, capacity building, smart technologies and research that captures net-zero development and the human experience related to our project to ensure sustainability beyond the Smart Cities Challenge.

With that said, this Smart Cities Challenge has already yielded success for the CNE. The CNE approached housing holistically from a 360-perspective for the comprehensive engagement of all stakeholders including community members, academia, industry experts and the supply chain. By undertaking this approach with a more fulsome consultation of the supply chain and industry stakeholders, the CNE was able find significant savings compared to the way business was normally done. In fact, detailed costing of the CNE prototypes was initially estimated at $3M for the Six-Plex however the Class B estimates for the Six-Plex came in under $2M resulting in greater affordability per unit. This cost savings also applies to all other new units built under our program.

Financial Tools and Methodologies

Fund accounting is the financial methodology used by the CNE that results in a self-balancing set of accounts for each fund established by legal, contractual or voluntary actions. Transactions are accounted for under five different funds established by laws. The accounting software, Sage 300, as well as Committed Cost systems are used for the financial operations. Those systems enable the CNE to account for expenses by department at the General Ledger level. The departments represent projects for the Special Projects Fund, the same applies to the General Operation Fund and the Capital Additions Fund.

Committed Cost systems enable the issuance of purchase orders related to specific projects taking into consideration the available budget per account and fiscal period. This information is transferred into Sage 300 in order to provide reporting per project including actual costs, budgets as well as commitments. The financial plan for our NZE program is based on budgeted cash flows on an accrual basis.

Project management implementation will use MS Project along with the principles outlined by the Project Management Institute (PMI) for project management and with cost

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

accounting methodologies managed through Sage 300. The CNE will further ensure proper project management by implementing all aspects of our ISO/IMS.

Risk Identification and Mitigation

Below are the risks identified by the CNE with respect to the financial operations of its NZE program.

Table 22 - Risk Analysis

Risks	Preventive Measures	Corrective Measures
Cost overruns	▪ Implement contractor/supplier management best practices ▪ Hire an experienced construction project manager and site supervisor ▪ Conduct audit on all construction and project management processes	▪ Adjust project scope and budgets ▪ Identify root cause and implement audit findings to improve efficiency
Unable to sell units as individuals can't qualify for a mortgage	Pre-screen and pre-qualify parties	▪ Identify additional purchasers ▪ Re-classify a 'for sale' unit as a conditional rent to own until the potential purchaser can qualify for a mortgage
Construction company unable to secure necessary resources for construction	Assist companies in securing capital funds on a project by project basis	▪ Foster partnerships and joint ventures between companies to improve their financial capacity ▪ Directly manage the project through Eastmain's development corporation ▪ Increase CNE's investment into the project
Cost of constructing net zero homes is too expensive in Eastmain	▪ Scale project to "net-zero ready" energy performance ▪ Identify and secure federal and/or provincial green energy subsidies to offset the cost of the alternative energy systems (e.g. solar) ▪ Redesign units to accommodate a smaller living space	▪ CNE develops an in-house green energy subsidy program ▪ Re-evaluate and redesign the construction system ▪ Build smaller units ▪ Enter into agreements with companies that result in lower profit margins in exchange for project guarantees
Insufficient rent collection on rental units to help support operation and maintenance and reinvestment into future construction	▪ Pre-qualifying renters by verifying their credit history ▪ Request rental deposits ▪ Verify capacity to pay ▪ Credit bureau reporting ▪ Ensure rental agreements are fair and drafted to look after the best interests of both parties while protecting the investment of the property owner	▪ Terminate occupant's rental agreement as a result of failing to pay and evict the tenant ▪ Amend rental agreement to require a co-signer whom would also be liable for any rental arrears ▪ Institute penalties through forfeiture of local subsidies and automatically apply grant to rental arrears ▪ Suspend eligibility for local grants, loans and subsidies to persons with rental arrears ▪ Take legal action
Negotiations with the supply chain are not successful in reducing the current cost of materials	▪ Pre-discussions with suppliers with regards to what we are trying to achieve with the SCC to foster win-win relationships ▪ Expand the list of suppliers that are approached	Re-tender the ordering of materials

Finalist Grant Report

The CNE supplemented the finalist grant with funds from its operations and partners to help offset the costs associated with project coordination, proposal development and the activities needed to design and build its systems and costing. The finalist grant funding was used along with CNE funds to develop the final proposal. Detailed use of those resources are as follows:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **Project Coordination**

  Expenses for the assignment and reassignment of CNE personnel to coordinate all project activities through the project management team

- **Stakeholder Engagement**

  Sessions were regularly held throughout the project development phase to acquire technical information and clarify expectations and roles of all stakeholders while obtaining feedback from the community members and all other interested parties

- **Proposal Development**

  Costs related to CNE staff time as well as the effort put forth in organizing information and assistance by partners to draft the final proposal

- **Building Designs and Systems expenditures** (architecture, energy modelling, engineering)

  Refining the designs of each of the housing prototypes that were developed based on extensive consultation with community members and resulted from energy modelling exercises and consultation with net-zero and local builders and the housing materials and equipment supply chain

- **Data Modelling**

  These costs were for the data modelling exercises required to determine the building system and technologies required to meet net-zero targets as part of the design process

- **Plans, Specs and Costing**

  These were incurred in developing the working drawings, design of the HVAC system and solar systems, analysis and selection of accessible housing equipment, and selection of the household lighting and other equipment

- **Jury Meetings**

  The costs for travel, lodging and per diem relating to meeting with the SCC Jury in Toronto to represent CNE's project and answer questions posed by the Jury.

Our project had a minor deviation regarding the original application. We decided to extend the project from five years to six years in order that year-1 could serve as a pilot year to ensure detailed costing is obtained through extensive project oversight and to identify true costs versus billed costs. The pilot year will be used to account for actual costs of material and labour to ensure data is available to properly analyse actual costs within the environment. This information will give policy makers data that reflects the northern reality thus enabling them to make informed decisions.

Plans, Specs and Costing			6,500	18,820	25,320
Jury Meetings			13,796		13,796
Total Quarterly Expenses	**$ 33,683**	**$ 32,780**	**$ 114,231**	**$ 206,213**	**$ 386,907**

Other Details

Class B estimates were established for the pilot construction of the Accessible House (first single-family house) and for the Six-Plex. A Class "B" estimate for the Six-Plex was derived from the detailed section, plans and elevations of the Six-Plex, and the costing for construction details and mechanical systems of the Accessible House (as these are the same construction details that will be used in all the NZE houses). For all other aspects of our project, Class "D" estimates will be used until building systems have been finalized and lessons learned from the pilot projects are applied. Plans and specs for Class "A" estimates for the tendering of the Accessible House will require identifying the specific exterior and interior finishing materials (flooring, lighting, etc.) and household equipment for the house.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 23 – Detailed Costing of NZE Program

Detailed Cost (accessible house)				
		Unit Price	**Quantity**	**TOTAL COST**
FIXED ASSETS	Accessible Housing Unit	$232.52	1,190	$ 276,700.00
	NZE Retrofit	NA	NA	$ 177,600.00

CHAPTER 9: IMPLEMENTATION PHASE

Duty to Consult with Indigenous groups

The CNE is an Indigenous group, having recognized and constitutionally-protected land rights in Eeyou Istchee, the territory where it will carry out its Net-Zero Housing Program. As such, the CNE is not subject to the duty to consult.

Figure 16. Treaties Map

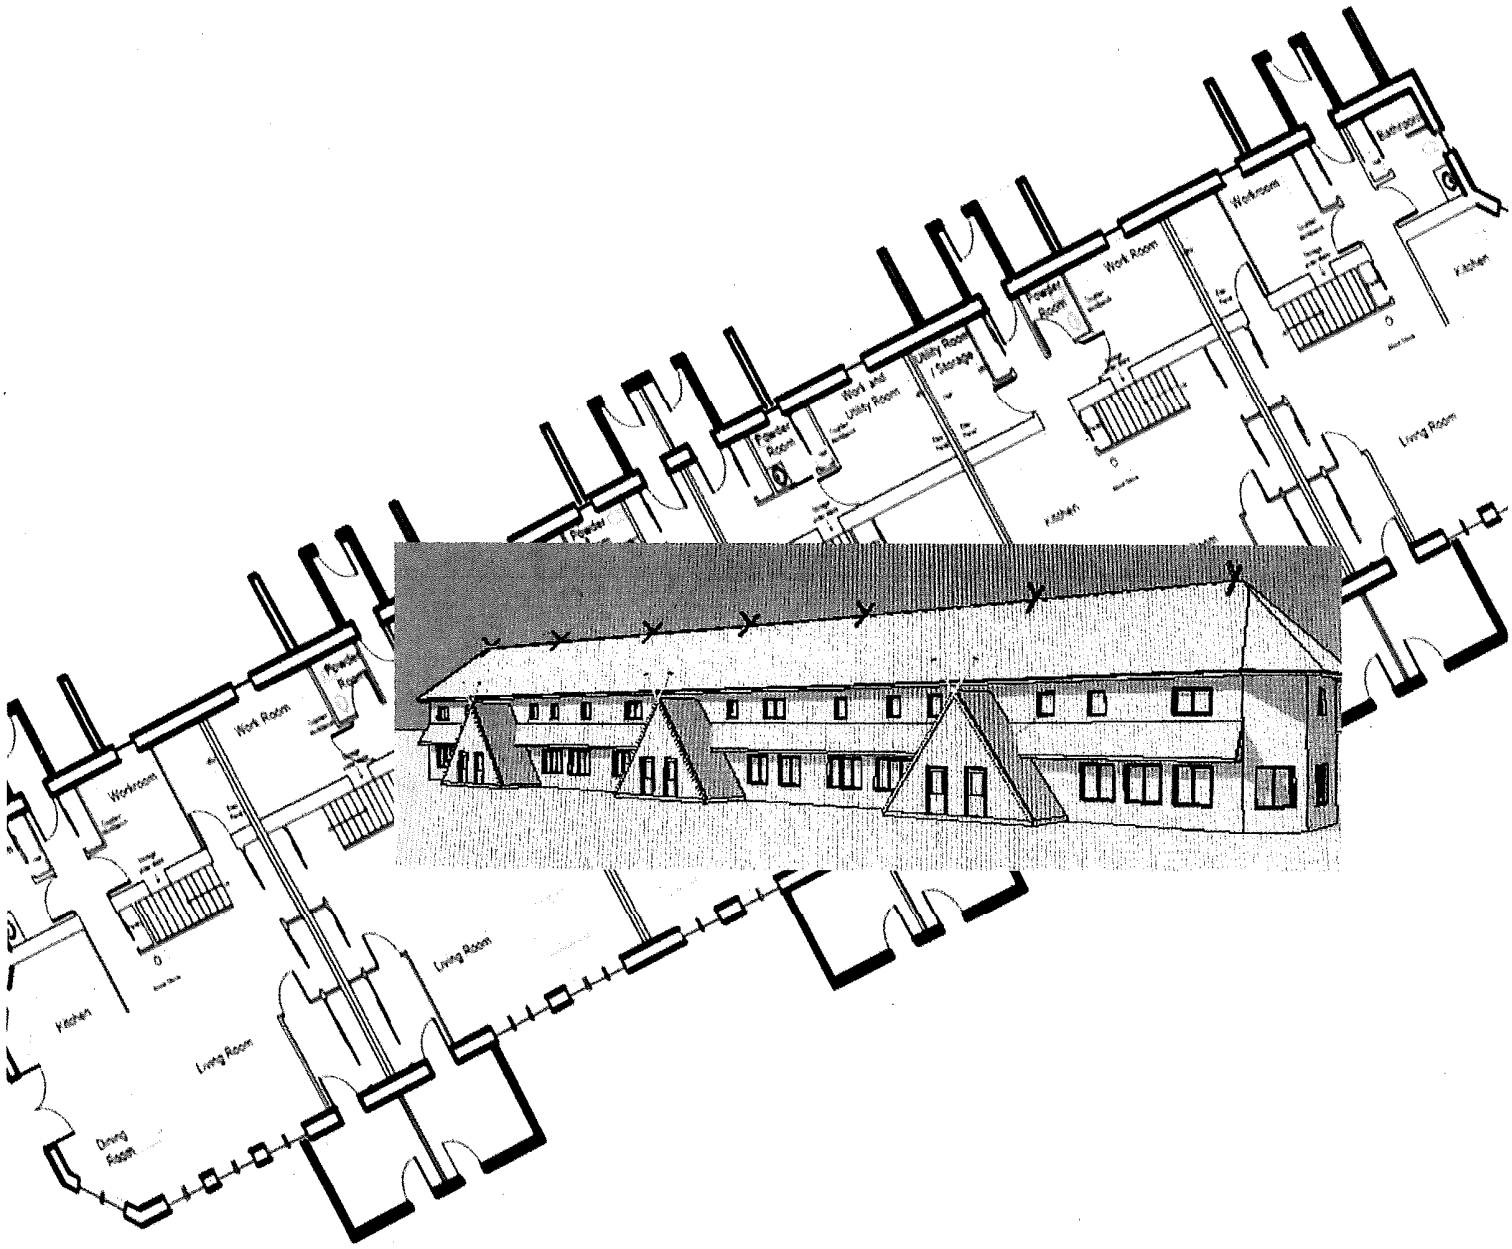
Modern Treaty Obligations

The CNE is one of the signatories to the James Bay and Northern Quebec Agreement, Canada's first modern-day treaty. The CNE therefore does not have any obligations, in the context of its NZE program, under federal or provincial legislation with respect to Indigenous treaty rights.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Community Employment Benefit (CEB)

If selected as the $5M category winner of the Smart Cities Challenge, the CNE will report on the Community Employment Benefit for Indigenous people. Its NZE program is inclusive in that it offers employment and business opportunities to youth, women and apprentices for skilled trades. Tendering for work that will be carried out under the NZE program will prioritise small, local Indigenous business and tradespeople.



Already the CNE has hired 3 youth under a work placement program to gain experience with the project management team and McGill University. The CNE will engage other youth as part of the trades training initiative under the NZE program. We will also target employment for youth with disabilities.

Part of our project management team includes an Indigenous-owned and operated engineering firm. The CNE will support Indigenous businesses as part of our procurement process.

Climate Lens Assessment (CLA)

Climate Lens Assessment is not applicable to CNE's project due to it being within the $5M category.

EXECUTIVE SUMMARY

Improving Community well-being. This statement highlights the challenge that the CNE intends to overcome with its Net-Zero Energy Housing Program.

Housing is essential for a healthy community and, like many Indigenous communities, the CNE has a critical shortage of housing for its members. The lack of adequate housing in Indigenous communities results in overcrowding, a factor in many of the health and social issues inflicting our communities.

In fact, the quality of housing in Indigenous communities has been a hot topic in Canadian news for years, and even recently. The effects of mould and inadequate housing are being linked in the media to serious health conditions and even the deaths of Elders and children. It is clear that housing remains forefront and centre for Canadians, and especially for Indigenous communities.

Through its Net-Zero Energy (NZE) Housing Program, the CNE will construct quality, energy-efficient homes that are affordable for its members. The NZE Housing Program consists of new builds and retrofitting of existing homes. An inventory of single-family homes, an Accessible House and Multi-Client Six-Plexes (Six-Plex) will ensure that housing responds to members' needs and financial capacity.

The CNE vision is clear – create an affordable, resilient, energy-efficient housing program that offers rental and private homeownership opportunities. Substantial performance measurement activities will enable the CNE to determine the success of its NZE program and ensure that milestones and deliverables are on time and on budget.

By establishing an experienced and dedicated project management team, the CNE has been able to develop a comprehensive project implementation plan aimed at achieving success. The CNE will introduce smart technologies and net-zero building techniques to collect quantitative data on the net-zero performance of the houses built and retrofitted under its NZE program. In addition, the CNE will collect qualitative data on residents' housing experiences.

By having a strong, well-established governance system auditable to an ISO/IMS, the CNE will effectively manage program implementation to ensure outcomes are achieved through effective stakeholder engagement, strong leadership and risk-based thinking. The CNE governance framework is grounded in openness, transparency and accountability.

Throughout the development of its NZE program, the CNE has continuously engaged with stakeholders to lead to better decisions and ensure a holistic approach is taken in addressing the housing crisis in Eastmain.

Because of the nature of the NZE program, the CNE will ensure that personal information collected from its members is used, stored and disclosed in accordance with the *Personal Information Protection and Electronic Data Act*. Information collected under the NZE program monitoring and research activities will be anonymized prior to any disclosure.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The CNE undertook extensive costing exercises that has already yielded savings for our NZE program. The project management team aggressively sought funding, and will continue to do so, in order to supplement the SCC prize money to ensure the viability of the NZE program with minimum financial risk. The CNE has committed to matching the prize money if selected as the $5M category winner.

The aforementioned elements are aimed at bringing success and sustainability to the NZE program. Through collaborations with academia, industry experts and government agencies, the CNE is capable of offering not just housing to its members, but a better quality of life. Initiatives like training, work experience and economic development opportunities will ensure a strong and viable future for the community.

Our NZE program was designed around scalability, transferability and replicability. The smart technologies used are commercially available, the governance structure is easily transferable to other Indigenous communities and the house designs and building techniques can be scaled to reflect the financial and technical capacity of other communities, taking into consideration their culture and traditions.

The CNE is an Indigenous community and therefore benefits from obligations generally on the federal Crown and provinces with respect to the duty to consult and modern treaty obligations. At the same time, the CNE has ensured that its NZE program is inclusive and leads to a better quality of life for youth, women, elders and people with disabilities.

CHAPTER 1: VISION

The CNE Vision

The CNE is proud of its heritage. Its vision is that of a self-sufficient First Nation that is able to offer its members, and future generations, a better place to live and grow. This vision is confirmed in the CNE 2018-2021 strategic plan (*See Annex A*).

Our final proposal pursues the vision of improving the quality of life and well-being of our members and our community by establishing a Net-Zero Energy (NZE) Housing Program to respond to the critical housing shortage. Housing is inarguably the foundation of a strong, healthy community. The lack of adequate housing in Eastmain, and other Indigenous communities, is a significant factor in many of the health and social issues inflicting our communities.

Housing issues are rooted in the history of our communities. The Cree Nation of Eastmain's vision is therefore tied to its past.

Eastmain has evolved from its origins as the Hudson Bay trading post headquarters for the east coast of James Bay. In the early 18th century, the Cree people began to settle in the area and the community of Eastmain was established. In 1762, Eastmain was relocated to the south shore of the Eastmain River at the mouth of James Bay to make it more accessible. Notwithstanding the Crees' long occupation of the region and the community, it was only in 1962 that the *Lands and Forests Act* (RSQ c T-9) reserved the lands for the exclusive use of the Crees of Eastmain.

In the 1960s and 70s, the Crees of James Bay (Eeyou Istchee) joined forces to oppose Quebec's James Bay Hydroelectric Project. From this concerted effort came the first modern day treaty, the James Bay and Northern Quebec Agreement. Since then, the Crees of Eeyou Istchee have entered into a number of other treaties with Canada, Quebec and Hydro Quebec. Most recently, the *Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada* which gives the Cree significant powers of self-government.

Today, Eastmain has a population of approximately 850 people and is the headquarters of the Cree Regional Trappers Association. Much of the economy is based on local and regional government employment, but there are businesses operating in accommodation and food services, retail trade and construction.

Eastmain is therefore a thriving community with strong ties to its traditions.

Initially, like many Indigenous communities, the CNE housing program offered only social housing constructed with federal funding. Housing under this program must be modest and low-cost. However, the housing designs do not satisfy the cultural and social needs of the occupants and the construction techniques relied upon are often not well-suited to northern climates. Consequently, frequent maintenance is needed to ensure the housing units functionality at a cost that undermines their initial affordability.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The social housing model is no longer sustainable and does not allow the CNE to satisfy the ever-growing demand for housing. This model further fails to reflect the economic realities of Eastmain and other Indigenous communities where successful business endeavours, government employment and traditional lifestyles co-exist, creating different levels of financial capacity.

In an effort to move away from this model and find new solutions to the housing shortage, CNE is changing its housing program. By offering other solutions, such as private homeownership and rent-to-own, the CNE can ensure that social housing is allocated to those who have limited financial capacity. The success of these alternatives to social housing depend upon the CNE overcoming the challenge of creating affordable and sustainable housing options.

Consequently, the CNE developed the Net-Zero Energy (NZE) Housing Program. This program addressed the challenge of building affordable housing that is also affordable to operate. Cree Nation of Eastmain's NZE program aims to offer culturally-appropriate designs, significant reductions in operating costs and enhanced resilience and durability while building community capacity and creating new local employment and economic development opportunities.

Since first conceived, the CNENZE program has seen some changes as a result of our ongoing efforts to design a program that is responsive to the CNE housing needs while reflecting our capacity. As a result, the projects in year 1 will be carried out as pilot projects and will be limited to the construction of an Accessible House and the retrofit of an existing house. This variation was driven by (a) restrictions on bulk buying construction materials before storage is available, (b) the start date for local assembly of building components, and (c) to allow for a true inventorying and costing of construction materials required for the NZE program.

It is noteworthy that the NZE program not only responds to regional directives, it also supports the Government of Canada initiative to develop a "net-zero energy ready" building standard and a model code guiding energy efficiency improvements during renovations. Government of Canada intends to have these codes adopted by the provinces and territories by 2030[1]. The Cree Nation of Eastmain's NZE program will put it at the forefront of this initiative, making it an Indigenous leader in addressing the challenges of environmental sustainability and climate change.

Outcomes

Although housing is but one issue facing Indigenous communities like Eastmain, it is a common underlying factor of many of the social and health issues. Housing that is durable, appealing and comfortable is the foundation of a strong and healthy community which is the Cree Nation of Eastmain's long-term goal. Therefore, the outcome is to establish an inventory of energy-efficient, resilient housing to respond to the needs of its members and residents. The houses must be comfortable, reflective of the Cree lifestyle and able to withstand the northern climate.

[1] See: https://www.canada.ca/en/services/environment/weather/climatechange/climate-action/federal-actions-clean-growth-economy/homes-buildings.html

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Over the next 6 years, the first being a pilot year, the CNE plans to build 5 new single-family homes, 5 Six-Plexes and retrofit 25 existing homes. This initial inventory will offer private homeownership, rent-to-own and rental options, making housing accessible to everyone.

The NZE program is designed to encourage capacity building and a sense of community. By fostering a sense of pride in the community and Cree culture, our NZE program will become a model for Indigenous communities across Canada.

Reflects CNE's needs

The NZE program is reflective of the true needs of the CNE and its residents. The housing shortage facing Indigenous communities is undeniable and cannot be ignored.

Numerous studies have drawn attention to the enormity of housing issues in the North including the inadequate supply, poor quality construction, poor affordability and designs that address neither the rigorous climate of Canada's north nor the cultural realities of its Indigenous peoples. As noted by Andy Moorhouse, past President of the Kativik Municipal Housing Bureau, when speaking about the reality of remote northern Indigenous communities in a 2011 address, "Housing is not the only issue, but all issues relate to housing"[2].

In its report on "On-Reserve Housing and Infrastructure: Recommendations for Change", the Senate Committee on Housing highlighted "the need to examine current initiatives to addressing housing on reserve". Citing one example of the challenges, the committee noted that even though $300 million had been set aside by the federal government in 2008 for the First Nations Market Housing Fund, which was expected to result in 25,000 new home builds in 10 years, by May 2015 only 99 homes had been built. The Senate noted that new approaches to housing, including innovative designs, alternative programs and new methods of implementation are needed. Northern research has also identified that Euro-Canadian forms of housing are incompatible with the social structure of Indigenous families[3].

CNE's NZE housing program is relevant and responsive to the needs of Eastmain. As of February 2019, the CNE had a shortfall of over fifty housing units, with the demand for two-bedroom units accounting for more than 50% of the current needs.

[2] If Not Now, When: Addressing the On-going Inuit Housing Crisis in Canada.

[3] *Examining the impact of Euro-Canadian architecture on Inuit families living in Arctic Canada*, Dr. Peter Dawson, University of Calgary, 2003

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Adding to the ever-present concerns around housing shortages and affordability are the issues of energy efficiency, energy security and community resilience. Remote communities like Eastmain are subject to periodic power blackouts that can extend for days at a time. During power outages in Eastmain, most houses which were built to meet the "minimum" requirements of the building code, will freeze up within hours. Moreover, these same houses use considerably more energy than houses in southern Canadian cities, adding to the high cost of home operation while also contributing to climate change.

The Eastmain Cree are attached to their culture and regularly practice traditional activities. In fact, most families rely on hunting, fishing and trapping to supplement their diet. While in the bush practicing their traditional activities, the homes are unsupervised, making them vulnerable to the outcomes of power outages. The construction techniques and smart technologies proposed in the NZE program will significantly reduce these vulnerabilities.

Ambitious and Achievable

The proposal is not only ambitious, but it is realistically achievable. Less than 50 years ago, the CNE had no road access and very little infrastructure supporting its community. Today, Eastmain is a thriving community with an airport, arena, sports complex, schools, health clinic and stores. The CNE provides all the usual municipal services to its members.

The CNE currently has a need for 52 housing units that it cannot satisfy. In a community of 255 homes this is significant. The CNE plans to build 35 new housing units and retrofit 25 homes and buildings over the next six years. This amounts to improving the backlog by 67%. The scale of the proposed program is enormous considering the size and population of Eastmain.

The NZE program is ambitious in that it proposes to tackle a problem that is not simply local but extends to Indigenous communities across Canada. Housing is conceivably the biggest issue facing Indigenous communities which must deal with significant housing shortages and unsuitable construction materials and techniques.

In order to address the significant housing backlog, the CNE plans to implement its NZE housing program. The NZE program is designed to be sustainable because creating an affordable housing scheme doesn't only mean controlling the costs of construction, but also controlling the costs of operating and maintaining homes.

The Cree's connection to family and land are factors that must be at the forefront of any solution if the CNE initiative is to be successful and sustainable. By building new multi-family and single-family homes, and retrofit existing homes, the CNE will be able to offer its residents better quality housing options that respond to their needs and financial capacity.

The CNE has the structure and capacity to implement and achieve success of its NZE program. It has an economic development corporation, Wabannutao Eeyou Development Corporation, and a construction company, Stajune Construction Inc., that are often involved in local community construction projects. The CNE will use both companies with a view to maximize local employment, entrepreneurship and housing affordability. It

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Table 1 – CNE Housing Needs: Past and Future

	Past 5 Years				
	2019	2018	2017	2016	2015
Backlog per year	52	51	40	36	28

	Projection over 6-year period*

Housing Stock	255	256	263	270	277	284	290
New NZE Construction	total 35 ✓	1	7	7	7	7	6
Will reduce backlog to		51	44	37	30	23	17

**Note: It is expected that the housing needs will grow over the next few years as our younger generation ages.*

As early as 2000, the Cree Naskapi Commission has emphasized the need to resolve the housing shortage and substandard housing in the Cree communities. Eastmain's NZE program is also in line with Government of Canada's national housing strategy which recognizes the housing crisis facing Indigenous communities and the need to develop new approaches that include increasing private homeownership opportunities, as well as the need to significantly improve the sustainability of housing in Indigenous communities.

Since 2017, the CNE has undertaken significant community engagement to ensure that its NZE housing program is meaningful for its members. In June 2017, the CNE held workshops, conducted home visits and consulted with members with a view to collecting information on house designs of different housing types. At the September 2017 annual general assembly, the CNE engaged in a broader discussion with its members for ideas on how to improve housing. These discussions have been complemented by consultations with service providers including health care and the fire department to ensure a comprehensive approach to addressing the housing shortage and ensuring a solution that is culturally-appropriate and reflective of the Cree way of life.

In addition, the CNE held its first Housing Forum in February 2018. The Housing Forum allowed CNE members to voice their views on the CNE housing needs and the Smart City Challenge proposal. The members contributed to the design of a culturally appropriate NZE multi-unit model home. The information and ideas obtained at the workshops, home visits and annual general assemblies led to the "Cree Café" where smaller focus groups have explored the issues and ideas generated during the broader consultative process. Through its Cree Cafés, the CNE has developed design innovations and established a means for ongoing community consultation on the NZE program.

In addition to high construction costs, the high cost of operation and maintenance remains a significant deterrent to home ownership and the development of home ownership programs in First Nations communities, including Eastmain. New home owners are often challenged to keep up with the high operating costs of their homes, while current social housing programs significantly subsidize operating costs. This deters potential buyers from investing into home ownership, remaining siloed into lifelong housing rental.

should be noted that Wabannutao Eeyou Development Corporation and Stajune Construction are in the process of restructuring to improve efficiencies for the implementation of our NZE program.

The CNE recognizes that the scope of its NZE program is such that it will need partners who can support and complement its efforts. The CNE carried out considerable consultation with community members and with experts in the areas pertaining to residential construction, construction standards and techniques and net-zero energy technologies.

The CNE identified potential partners because it recognizes that a program this ambitious cannot be undertaken alone. The CNE has established relationships with academia, businesses and government agencies and organizations to ensure the success of its NZE program. Where appropriate, the CNE has secured commitments from its partners and is developing formal agreements relating to the role that these partners will play in the program. These partners will all contribute to ensuring and measuring the success of the program.

In addition, the CNE has engaged with the supply chain. By sharing key information with suppliers, the CNE has been able to start tracking the actual costs of the NZE program. This is just the start of the Cree Nation of Eastmain's efforts to establish a resource management system aimed at enhancing accountability and responsibility.

The CNE has put significant effort and considered all its options to resolve the housing shortage and create better-built, energy-efficient homes. Creating an NZE community is therefore very ambitious but achievable.

Meaningful

The CNENZE program will realize outcomes that are meaningful for residents of Eastmain by constructing new NZE homes and retrofitting existing homes. The new homes will allow CNE members to enter the housing market at different economic levels while ensuring that members who rely on social housing are provided homes that can withstand the northern climate while offering a comfortable living environment.

CNE members have had a say in the NZE program though community consultation sessions and workshops at which they received information about NZE program and smart technologies. More importantly, our members played an important role in shaping the housing designs and the technologies that will be used in the NZE program, ensuring community-wide acceptance and approval.

The lack of adequate housing in Indigenous communities has resulted in overcrowding which is an important factor in many of the health and social issues affecting these communities. The current housing model and funding formulas in the on-reserve social housing program are not a sustainable solution to the housing shortage. These have resulted in the widespread use of housing designs that do not meet the cultural and social needs of occupants and construction techniques and standards that are often not well-suited to northern climates.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Well-suited to Smart Cities Approach

The CNE NZE program is grounded in the past and forward-looking in proposing an achievable solution to the longstanding housing shortage, making it well suited to the Smart Cities approach. The CNE has a community wide fiber optic infrastructure, making it ideal for a Smart Cities approach to creating a connected, energy-efficient community.

Significant collaboration with experts, suppliers and key stakeholders has enabled the CNE to design its NZE program. Academic partners have jumped on board to undertake studies of measurable outcomes like energy savings and generation and less tangible outcomes like the comfort and happiness of occupants of NZE homes. Suppliers and government agencies consider the NZE program proposed by the CNE as creating new opportunities for development and capacity-building in the North.

The NZE program embodies the Smart Cities approach by employing smart technologies and connectivity to ensure open, transparent, accountable and responsible government. CNE is implementing a combination of ISO Standards to put in place processes and standards to better serve its members and increase transparency and accountability. These efforts include creating policies and First Nation laws that establish guidelines, a framework and rules in discrete areas, including housing. Given the importance of housing to community well-being, evolving societal views and the ever-changing technical landscape in this sector, the CNE intends to continue the revision of its Housing Policy, a process started at its Housing Forum, where members were given an opportunity to voice concerns and put forward ideas to improve community housing.

The smart technologies to be used in establishing NZE homes will ensure that traditional practices are supported in modern homes. Occupants or the CNE can monitor homes even while in the bush to ensure that the home systems are properly functioning.

The data generated through smart technologies will allow for better decision-making by the CNE and empower residents to better control energy use. This data will also enable the CNE to adjust its NZE program to be more responsive to the needs of its members. More importantly, such data may facilitate discussions with public energy agencies on energy use and with Canada Mortgage and Housing Corporation on housing designs and construction materials for northern climates.

The CNENZE program is transferrable to other communities facing housing issues and looking to create a more sustainable, resilient housing program. Not only can the NZE program be shared with other communities, it can be scaled to reflect the needs and capacities of these communities. Furthermore, our NZE program is particularly responsive even for off-grid communities as it will decrease the energy load on the diesel-generated electricity grids, thereby reducing significantly greenhouse gas emissions.

Measurable

The smart technologies to be used in the construction and retrofitting of homes will permit detailed data collection relating to energy use and production. The CNE will leverage this

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

data to make better decisions and ensure the NZE program attains its objectives. The data will also be used by the CNE and its partners to make improvements to the NZE program and measure its success.

In addition to monitoring the NZE program, a social research platform will be established to assess, over time, how the program is contributing to community well-being. Housing conditions are a well-recognized determinant of health. We will evaluate how the NZE program fosters a sense of well-being by (a) reducing overcrowding through the construction of new homes, (b) improving comfort and livability by retrofitting existing homes, (c) designing houses that meet the cultural and social needs of occupants, and (d) by offering a range of housing tenure.

This social research platform will also serve to document the opportunities, challenges and best practices for scaling the NZE housing program to other Indigenous communities across the country.

Progress toward Outcomes

Since first submitting its proposal, the CNE has continued in its efforts to implement its NZE program.

The CNE has conducted community consultations and obtained community support for the NZE program. With input from members, the CNE has developed housing models that reflect and complement Cree culture in their layout and design.

The CNE has conducted modelling exercises to ensure that the NZE homes can achieve net-zero energy status. Through this process, the CNE has identified the building system, levels of insulation, the types of windows, the size of solar energy component and the other technical requirements needed to achieve net-zero energy in Eastmain.

Finally, the CNE has obtained funding from Canada Mortgage and Housing Corporation to develop and implement the social research platform in collaboration with the Canada Research Chair in Housing, Community and Health at McGill University in Montreal.

Why Choose Us

The CNENZE program is concrete, measurable and transferable. This means that it aligns perfectly with Canada's declaration that housing in Indigenous communities is a government priority.

While NZE projects may not be considered innovative generally, establishing an NZE program in the North is innovative. Moreover, implementing a community-wide NZE program that includes multi-unit residential buildings has never been contemplated – until now. Implementing the NZE program as an opportunity for capacity-building also sets the CNENZE program apart and makes it innovative.

The CNE approach to the Indigenous community housing crisis makes our NZE program super-innovative. The CNE is addressing this holistically by bringing together community

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

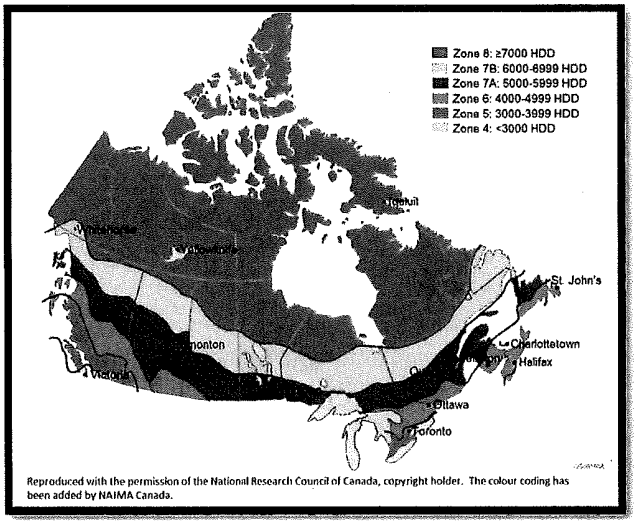
members, private sector actors, experts, public sector agencies and academia in order to find feasible solutions to creating affordable and resilient housing.

Much interest has been expressed in the CNE NZE program because it is aimed at a diverse clientele. Under our NZE program, the CNE is offering rental housing for low-income residents, rent-to-own and entry-level private homeownership. The designs give the CNE the flexibility of blending clientele for any combination in the Six-Plex and other housing options.

Unlike some proposals, the CNENZE program is relevant and responsive to the situation in many Indigenous communities across Canada. Creating an affordable, resilient housing program therefore also addresses a national problem, the critical housing shortage in Indigenous communities. The collection and analysis of pertinent data will allow the program to adapt accordingly to real quantifiable and qualifiable needs.

Our NZE program can be scaled to reflect the needs, financial constraints and capacities of other Indigenous communities across Canada. The program's scalability makes it easily transferable to other Indigenous and non-Indigenous communities as a solution to address housing shortages. Moreover, the program is designed to create economic development and capacity-building opportunities for Indigenous communities.

By designing a program that adheres to Smart City principles the CNE is setting the groundwork for a future of sustainable and durable housing for Indigenous communities that ensures openness, transparency and accountability at all levels. This means that members of these communities are involved in resolving the issues affecting their housing programs and informed of contracting and expenditures related to NZE homes.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CHAPTER 2: PERFORMANCE MEASUREMENT

Outcomes-based Performance Measurement Plan

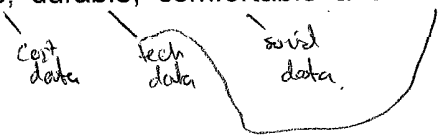
Eastmain is located in Climate Zone 8 (Figure 1), the coldest climate zone in Canada.

Figure 1. Climate Zone Map

Its location and climate bring challenges to the CNE goal of creating a net-zero energy community. The collection and analysis of performance data relating to the NZE program is essential. Significant technical, social and costing data will be collected during the project. Technical data will be used to measure the performance of the homes constructed and retrofitted under the NZE program and will enable the CNE to identify shortcomings and take lessons-learned to make adjustments to the building systems and equipment accordingly. Social data will be used to measure the success and suitability of the designs selected for the NZE program and to make changes as may be needed to ensure the comfort and enjoyment of the occupants. Costing data will be used to first determine the actual itemized costs of construction and to build on efforts to reduce the cost of housing construction in Eastmain.

To address the wide range of housing issues in Eastmain, as part of the Smart Cities Challenge, the CNE will continue its transition from a social housing-based program to a market-based program. The primary criteria for determining housing types for construction will be financial capacity. This will also involve changing the underlying culture in Eastmain where social housing has been deeply inculcated.

The Eastmain NZE housing program is aimed at responding to the need for housing while inciting a shift in culture.



Links to Outcomes

The program will have three primary components: (a) the design and construction of a culturally-appropriate net-zero energy Six-Plexes, (b) the design and construction of a net-zero energy single-family homes, and (c) the net-zero energy retrofitting of existing homes in the community, all of which will be equipped with smart home technologies. These three components will constitute the "next generation" housing in Eastmain and will enhance social inclusiveness, by stimulating our local economy and safeguarding the health and environment of our community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Educating residents on the proper use and maintenance of housing will be a longer-term outcome of the CNE NZE program. Likewise, given the new housing policies and rules being implemented in Eeyou Istchee, the CNE must also find ways to inform suppliers and builders that wish to participate in residential construction in Eastmain of these policies and rules.

At the end of the NZE program, the CNE will have created a framework for the design, construction and operation of affordable, durable, comfortable and resilient net-zero energy houses in Northern communities.

Project Activities

Consultation

The CNE has carried out ongoing consultations on housing issues in the community through a range of initiatives including the Eastmain Annual General Assemblies, Cree Café's, design charrettes (integrated design workshops), site visits, meetings, the Eastmain Housing Forum and the Eastmain Builders Forum.

The first step to creating the NZE housing program involved engaging the community in the design of a culturally-appropriate NZE Six-Plex, consisting of 2 social housing units, 2 rent-to-own units, and 2 starter home ownership units. The CNE then consulted members on the design of an NZE single-family home prototype as a model for residents wishing to purchase their own home.

Through further consultation, that included the health and public safety sectors, the CNE designed other NZE housing prototypes to accommodate different needs, including a "Cree Elders House", an "Accessible House" and a starter house. Consultation with the health and public safety sectors also allowed the CNE to ensure that the designs and components of the Six-Plex, single-family homes and Accessible Houses provided a healthy, comfortable living environment that would also respond to the needs of the occupants.

The CNE also engaged with experienced net-energy zero builders who have worked on projects in northern communities. These builders, with other net-energy zero experts, brought a perspective and experience that enabled the CNE to establish the best building strategies, techniques and materials.

The amplitude of the CNENZE program and the goal of creating affordable housing called for engagement with local builders by the CNE and the Cree Nation Government. Local builders were given information on the NZE building concepts and program structures. More importantly, by engaging with the local builders, the CNE obtained their feedback on the proposed building systems and ensured that the building systems and technologies are feasible in Eastmain. This process has set a strong foundation for the integration of the NZE program, thereby ensuring its success in Eastmain.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Analysis

Much analysis and consideration went into defining the parameters of the CNENZE housing program to ensure that it was feasible and responsive to the realities of the North.

McGill University presented at the Eeyou Mitchuap forum on its Nunavik housing study. This study provides baseline information that has been useful in the preliminary analysis of housing requirements and models and will continue to be useful in testing the results of the CNENZE program.

The CNE consulted different experts on net-zero energy building systems, materials, technologies and construction strategies. Through extensive energy modelling on the Six-Plex and Accessible House the CNE was able to determine the level of energy production that would make net-zero energy feasible in Eastmain. The CNE has calculated the amount of energy production required, including the size of solar array and the capacity of air source heat pumps needed to attain net-zero energy. The CNE has thus determined, in its climate, the combination of energy saving construction techniques and materials (wall systems, insulation levels, windows, etc.) with energy producing technologies (solar photovoltaics, air source heat pump) to successfully achieve net-zero energy.

Analysis will include the activities conducted after implementation of the NZE program. The CNENZE program will include establishing a detailed costing regime that will ensure Smart Cites Challenge funds are used to deliver affordable net-zero energy houses and retrofits with smart technologies within the community. The costing regime will include an in-depth analysis of the transportation costs incurred to bring construction materials to Eastmain. This analysis will enable the CNE to determine the impact of transportation on the overall cost of housing in northern, remote communities like Eastmain.

Pre-NZE Activities

The CNE carried out an assessment of its existing housing inventory to determine the amount and type of renovations required to improve the functionality of these homes. This assessment will permit the CNE to identify the houses that will be best suited for retrofitting to make them function at the net-energy zero level.

Following significant community consultation which enabled the CNE to identify the floor plans and designs, it was time to decide on construction timelines. In order to ensure the program's success, the CNE has chosen to start with a single-family home that will allow it to test its processes and construction techniques. This choice was also driven by the necessity for an Accessible House in the community to respond to the needs of a disabled member. The CNE conducted extensive energy modelling on the Accessible House to ensure that it could satisfy the net-energy zero performance standards.

NZE Program Activities

In 2019, the CNE will construct one single-family Accessible House and carry out one retrofit of an existing home as part of a pilot project. This will also serve as a prototype for Eastmain residents with disabilities. The CNE will have the opportunity to test the construction materials and the building system used in projects before proceeding with the construction of additional single-family homes, multi-unit housing and retrofits.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

These initial construction projects will be used to develop a detailed and comprehensive list of all the materials required for each of the net-zero energy housing projects – the Six-Plex, single-family home and net-zero retrofit. The CNE will also create a detailed breakdown of projected labor costs for each stage of the construction process. Proper tracking and recording of the materials and labour required for each project will ensure that the NZE program is sustainable, affordable and transparent.

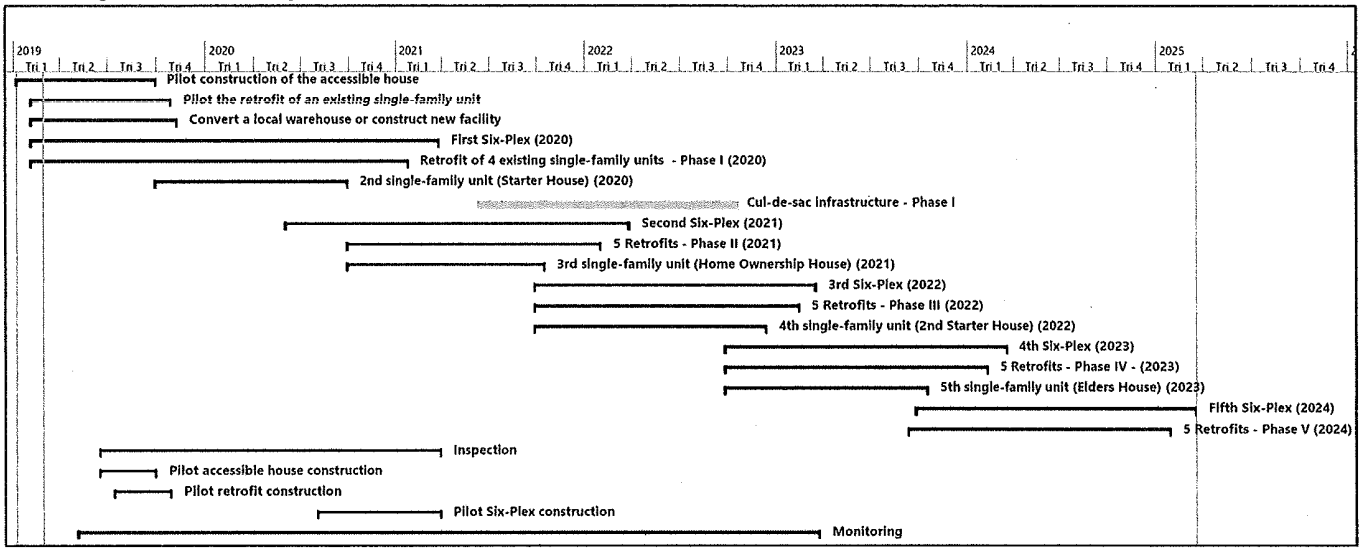
An in-depth post-construction evaluation will be carried out that includes a cost comparative analysis of the projected material and labor costs with those of the detailed costs that were tracked during the construction process. This evaluation and comparative analysis, combined with quantitative data obtained from Hydro-Quebec meters and the Concordia University study, will allow the CNE to make improvements aimed at ensuring the performance of the net-zero energy building system. Lessons learned from the construction of the Accessible House will be used and scaled to the Six-Plex. From its experience during the pilot project phase, the CNE will select the materials for the construction of the Six-Plex and future single-family homes.

The CNE has already identified transportation times as a significant factor in project delays and costs, especially in remote communities, as well as the inability to store enough construction materials on site to ensure continuity of work on projects. To address this issue, in 2019, the CNE will construct or rehabilitate a facility where construction materials can be stored and building components can be assembled. This is a significant change in how construction projects are usually managed in Eastmain where materials are purchased only when construction is to start, with delivery occurring much later, leading to work stoppage when supplies or materials run out as well as delays in starting construction. By having a storage facility on-site, the CNE can time its purchasing to get a better price on materials, buy in bulk, and be in a position to commence construction immediately. This approach will also permit the CNE to maintain and control an inventory, reduce wastage and prevent the deterioration of materials.

In 2020, the CNE will construct a single-family home and one Six-Plex. In addition, the CNE will retrofit four existing residential units. To retrofit existing homes to net-zero energy standards, the CNE will incorporate a super energy-efficient "wall panel system", in conjunction with construction techniques that will enhance the energy efficiency of foundations and roofs.

Keeping in mind the goal of building a strong community, the NZE program includes various opportunities for capacity-building and economic development.

Timelines and Deliverables



Our NZE program is a multi-year, multi-phase project during which the CNE will construct single-family homes and multi-unit buildings and retrofit existing homes. In year 1, 2019, the CNE will construct, as part of a pilot project, an NZE single-family Accessible House and retro one existing home. In the second year, the CNE will build one NZE Six-Plex and one single-family home and will carry out NZE retrofitting of four homes. In 2021, and for

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

all the subsequent years, the CNE plans to construct one Six-Plex and one single-family home, except in the last year, and carry out 5 retrofits following the 2020 schedule.

The below tables set out the timelines for the NZE program.

Figure 2. 2019 Project Timelines

Payment Schedule

The CNE has based the payment schedule on the above timelines. The payment schedule is intended to reflect the amounts needed to successfully complete the activities within the established timelines.

Payment Schedule

With these and the projected construction costs, training costs and other related costs, the CNE has established the following payment schedule for the Smart Cities Challenge prize money that is reasonable and rational.

Table 2 – Payment Schedule

Year Ended	Year Ended	Year Ended	Year Ended	Year Ended	Year Ended	Total
31-Mar-20	31-Mar-21	31-Mar-22	31-Mar-23	31-Mar-24	31-Mar-25	
Proforma	Proforma	Proforma	Proforma	Proforma	Proforma	
$517,285	$1,160,551	$1,225,331	$1,063,633	$1,033,200	-	**$5,000,000**

Quantitative and Qualitative Indicators

The CNE has established a collaborative relationship with Concordia University and McGill University for the purpose of permitting the collection and analysis of quantitative

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

and qualitative data. This data, which will allow us to measure the success of the NZE program, includes

- air quality
- thermal comfort through
  - ❖ objective measurements on energy efficiency
  - ❖ resident's self-reported assessments of thermal comfort
- energy consumption
- energy production
- Potential moisture issues in building components
- decay heat loss
- energy use trends
- well-being, based on indicators like
  - ❖ satisfaction with new home designs and retrofitted homes
  - ❖ thermal comfort
  - ❖ sense of home
  - ❖ quality of life
  - ❖ social inclusion, including socioeconomic indicators

Quantitative Data Measurement

The technologies to be implemented in this project are innovative and new to the region. The performance data to be collected is invaluable to validate their (a) application and (b) long-term performance, and to (c) improve the design, construction and operation of net-zero energy homes in northern regions.

Field data to be collected will be used to determine the (a) actual net-zero energy status of the homes, and (b) understand occupants' interaction with and operation of net-zero energy homes (like the set-points of indoor temperature, operation of HRV and air source heat pumps, window use, etc.). This data on indoor environmental quality will also be used in the qualitative study to assess the well-being of occupants with respect to the physical environment.

Qualitative Data Measurement

McGill University will conduct surveys and group meetings and attend Cree Cafés to collect information relating to occupants' experience in net-zero energy homes and retrofitted homes. The data will measure, amongst others, the (a) level of satisfaction with home designs and layouts, (b) operational functions, (c) compatibility with Cree culture and (d) pride in ownership.

Energy Modelling

The CNE will carry out detailed comprehensive energy modelling of the single-family home, the Six-Plex and the net-zero energy retrofits using Integrated Environmental

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Solutions (IES) or Energy Plus systems and drawing upon the lessons-learned during the construction of the Accessible House. The energy modelling will consider the effects of (a) night-time free cooling, (b) crawl space thermal mass and (b) shading to eliminate or reduce the use of air-conditioning, and provide recommendations aimed at improving the resiliency of the net-zero energy homes constructed in Eastmain.

The activities carried out during the comprehensive energy-modelling will include

- energy modelling based on the actual designs
- comparison of the energy-modelling results to HOT2000 software results
- optimization of the passive design and integration of the proposed technologies
- calibration of the comprehensive energy modelling with the field monitoring data collected on the Accessible House to optimize the design and construction of NZE homes
- hygrothermal modelling using the software WUFI Pro, calibrated with field measurements, that will be used to design alternative moisture-resistant envelope assemblies for net-zero energy homes in other climatic regions.

Monitoring, Reporting and Evaluation

Monitoring

The CNE and its partners, Concordia University and McGill University, will carry out various monitoring activities that will enable them to ascertain the success of the NZE program.

The sensors installed in the homes will collect important data that will be communicated through the battery operated dataloggers to a web-connected computer managed by the Cree Nation of Eastmain's Housing Department. The data will then be anonymized before uploading to an analytical website where it can be analysed by Concordia University. In addition, Concordia University will conduct quantitative studies on the air quality and energy consumption of a sampling of each of the housing prototypes constructed under the NZE program and the net-zero energy retrofit homes.

McGill University will analyse occupants' experience in the NZE homes and retrofitted homes. The well-being of the occupants will be measured and monitored over time using a range of indicators as described in the previous section. Data will be collected each year, using survey questionnaires administered to all Eastmain residents. This process will allow McGill University to monitor any change in the sense of well-being over time for Eastmain residents who move into NZE homes or whose homes are retrofitted and compare this to those residents whose housing situation does not change.

Smart tech

Given that smart meters have been installed on most homes, the CNE will seek to obtain quantitative information from Hydro-Québec respecting the energy consumption of each home. Using baseline data on non-NZE homes, the CNE will be able to determine if the NZE program is achieving its objectives and measure this achievement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Controlling the costs and timelines for constructing NZE homes requires consistent monitoring. As part of its NZE program, the CNE will establish a supply management system. This system will enable better monitoring and control of construction materials and their costs, including the transportation costs, as well as ensuring timely ordering to avoid delays.

Field Monitoring

Field monitoring will enable the CNE to identify any deficiencies in the program and ensure that the lessons learned through monitoring are applied to the NZE program. This will ensure that the NZE program is constantly adapting and improving to correct those deficiencies identified, if any, and responding to the needs of the community.

The monitoring protocol developed in year one of the NZE program will be applied to the construction and retrofitting projects in subsequent years. In year one, the Accessible House, scheduled to be completed by September 2019, will be monitored. The data collected through monitoring will be used to validate the design and construction techniques used, correct any issues, and incorporate design alterations to make improvements to the building's performance. For housing projects constructed in subsequent years, a similar data collection plan would be implemented for performance comparisons. Field monitoring will include:

- hygrothermal performance of the building envelope to ensure durability
- indoor environmental quality including
  - indoor air quality
  - thermal conditions
- energy performance including end energy use of
  - HVAC equipment
  - lighting
  - appliances
  - any other equipment
- energy generation of photovoltaic array

Concordia University will visit Eastmain twice during each construction season. The first visit will take place after the framing and roofing have been completed to install sensors and dataloggers, conduct blower door tests and seal any openings in the building envelope. Once construction is substantially completed, Concordia University will return to Eastmain to install energy monitoring equipment on the different systems, ensure the proper functioning of the sensors previously installed and conduct a second blower door test.

Hygrothermal Performance

The hygrothermal conditions, including the relative humidity and temperature (RH/T), of the envelope assemblies such as the walls, roof, attic and crawl space will be monitored. This data will be used to assess the risk of moisture-damage arising from condensation,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

decay and mould growth. An on-site weather station will be installed to monitor the wind speed, wind direction, rainfall intensity and global solar radiation. The weather station data will be used to correlate the hygrothermal performance and energy consumption and production of the NZE homes with local weather data for field data analysis and model validation.

Indoor thermal conditions and CO_2

RH/T and CO_2 sensors will be installed in indoor spaces to monitor thermal conditions and indoor air quality, thus enabling the CNE to confirm that indoor air quality standards are being met in the NZE homes and retrofits. This information will also be used to assess performance of the HRV system and determine if it is delivering sufficient ventilation to the housing units. Indoor RH conditions when combined with temperature data, will be used to assess thermal comfort. The RH data will also be used to determine the moisture loads for hygrothermal modeling to evaluate the resiliency of the NZE homes.

Energy Monitoring

Understanding and evaluating energy use and production in NZE homes is paramount to successfully achieving high performance and annual net-zero energy use. Both energy consumption and production patterns will be monitored. Monitoring will measure

- energy consumed by discrete building systems will be monitored, including
  - the air source heat pump and ducted mini-split (*Heating*)
  - ventilation fans
- appliances, including
  - stove
  - dishwasher
  - washer
  - dryer
- plug loads and lighting (*other than those attached to building systems and appliances*)
- Heat Recovery Ventilator (HRV), including
  - temperature conditions on all 4 sides of the HRV to calculate efficiency
  - temperature readings at exhaust inlet/outlet and supply inlet/outlet
  - air flow rates
- electricity produced by the solar PV array

The monitoring protocol and modeling strategies developed during the NZE program can be implemented in other northern communities, including remote, northern off-grid communities, to investigate options for the design, construction and technologies of net-zero energy homes. The protocol will also be useful for developing the framework/guide for creating successful, affordable and resilient net-energy zero housing.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Risk Management

Identification of Risks

Table 3 – Performance Measurement Risks and Mitigation Strategies

Risks	Preventive Measures	Corrective Measures
Power loss to data loggers	Install data loggers with a battery backup and regularly verify power	Replace battery
Loss of internet connection		Data collected from sensors will be stored in a local computer until connection is restored and then will be transferred*
Faulty sensors	Test sensors prior to installation and after installation to ensure proper functioning and accuracy	Replace faulty sensors
Power loss to data collection computer	Use a battery power supply and an uninterrupted power supply (UPS)	Use backup Laptop computer Reboot computer when power is restored*
Data collection program crashes	A script has been written to force laptops to automatically reboot at certain intervals to ensure performance	Laptop will be restarted manually if necessary*

** On-site support is available in Eastmain allowing remote troubleshooting*

CHAPTER 3: PROJECT MANAGEMENT

The CNE has put significant effort into establishing a project management framework that will cover all phases of the NZE program. From identifying resources and needs to develop resources locally, to identifying the accounting, monitoring and reporting methods the project management plan proposed by the CNE will ensure the success of our NZE program.

To be long-term, the NZE program must look to the future and find ways to bind the community to the program. The CNE therefore established partnerships aimed at building capacity locally in the trades and specialized fields. This will guarantee success of our NZE program as Eastmain becomes more self-sufficient and its residents have opportunities to grow and create better lives for themselves and their families.

Project Scope and Scheduling

Project Scope

The NZE program consists of several projects and phases. Starting with the construction of a net-zero energy Accessible House and NZE retrofit. In support of this program, the CNE will establish a warehousing and inventory-costing system. In the subsequent years, the CNE will add on projects in a carefully thought-out sequence, that will include an Elders House and Private Homeownership Houses.

In preparation of the NZE retrofit project, the CNE has availed itself of an Indigenous Services Canada initiative to carry out an inspection and full-scale assessment of 24 existing houses in Eastmain. The inspection will include an estimate of the costs of

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

renovation and an appraisal of the house. The data obtained from this will assist the CNE in identifying the houses to be retrofitted under the NZE retrofit program.

The NZE program also consists of ancillary projects that will support the program. These include the construction or rehabilitation of a facility for warehousing construction materials and assembling building components. This facility will enable capacity-building and create employment and economic development opportunities for the residents of Eastmain, which in turn will pave the way toward creating a strong, healthy community.

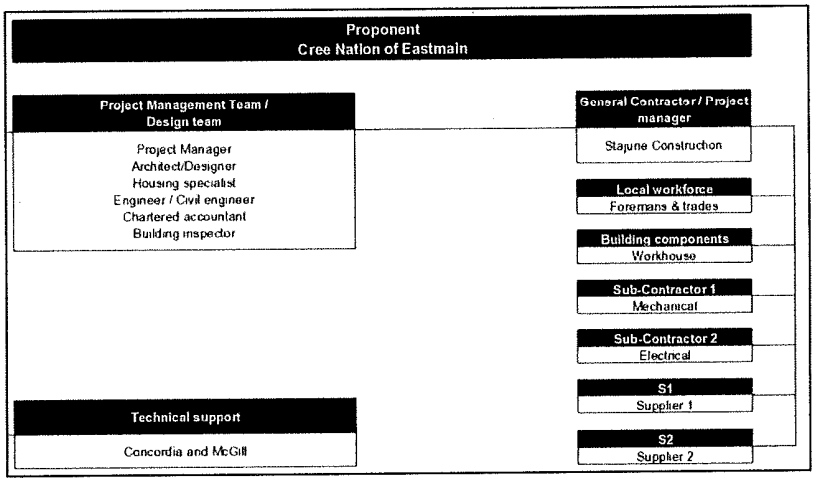
Resources Assessment

The CNE has the human, material and financial resources needed to make its NZE program a success. By phasing in the projects to be completed as part of the NZE program, the CNE will also ensure that it has the experience and capacity for each phase. This will also give it time to create capacity where needed.

Table 4 – Resource Assessment

Workforce Capacity		
The CNE has the human, material and financial resources needed to make its NZE program a success. CNE's construction company, Stajune Construction Inc., has experience carrying out large and smaller scale projects in Eastmain. An inventory of workforce resources has allowed the CNE to identify lacunae in the community and the areas where capacity-building must be focussed. In the interim, there are specialized tradespeople in other Cree communities and nearby Quebec cities who are eager to work on the pilot projects, while the CNE builds up its local capacity.		
Project management capacity	Experienced project manager	
	Housing specialist	
	Design consultant	
	Civil engineer	
	Chartered Accountant	
Trades capacity	**Trades**	**Quantity**
	Foreman	3
	Carpenters	21
	Machinery operator	16
	Plumber	0
	Electrician	0
	HVAC	0
Infrastructure readiness		
The CNE has **30 fully serviced lots ready** for new NZE homes. Eastmain has a **complete fiber optic infrastructure** throughout the community. This will enable long-term data monitoring and residents' access to the information obtained through the NZE program. There are local **warehouse facilities** where construction materials can be stored and building components assembled of. The CNE plans **to build or to renovate a warehousing facility** to store construction materials and assemble building components.		

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information



Workforce Capacity

The CNE will work with its construction company, Stajune Construction Inc., to implement the NZE program, each operating in their sphere of activity toward the success of the whole program.

The success of the NZE program rests on having a good foundation. In this case, the foundation is the project management team that will oversee the projects carried out under the NZE program and support to Stajune Construction in its management of the construction projects and cost control. The NZE Project Management Team will be made up of the resources identified in Figure 3.

The NZE Project Management Team has over 90 years of combined experience in finance and administration and 80 years in the construction industry. Project Management Team expertise includes financial management, LEED certification, super energy-efficient building techniques and northern and remote housing. The Team further benefits from the partnerships established with universities, government agencies and industry experts who have been involved in our NZE program.

Figure 3. Project Management Flow

Stajune Construction will act as the general contractor/project manager of the NZE construction projects. Work will be subcontracted out to local companies and entrepreneurs operating in the construction sector. The CNE has held consultations with local contractors who have all indicated their willingness to work collaboratively on the NZE projects. These contractors understand the critical issues and the importance of completing the various projects on time and on budget.

Current Workforce

In February 2019, the CNE held a construction meeting for the purpose of inventorying certain trades in Eastmain.

This inventory has allowed the CNE to identify lacunae in the community and the areas where capacity-building must be focussed. In the interim, there are specialized trades in other Cree communities and nearby Quebec cities who are eager to work on the pilot projects, while the CNE builds up its local capacity.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Although the CNE did not do an inventory of general labourers, a Cree Nation Market Survey compiled by Cree Human Resources Development (CHRD), there are approximately 17 men and 22 women looking for employment in Eastmain. Given that Eastmain's total workforce is 498, this yields an unemployment rate of approximately 8%.

Capacity-Building

To be meaningful and impactful to the community, the NZE program must be sustainable well beyond the scope and timelines of the Smart Cities Challenge. The CNE must therefore ensure that it can develop the capacity of the local workforce. Throughout its NZE program, workers will develop specialized skills including

- net-zero energy building techniques
- wall systems construction
- flooring
- cabinetry
- electrical and plumbing
- HVAC installation and maintenance
- roofing
- retrofitting

Planning for capacity-building activities has already started. The CNE is currently working with potential partners who are experienced net-zero energy builders, to provide work placement training. Four carpenters have been identified for training on net-zero energy construction techniques and systems. The training will give these workers the skills required to carry out and supervise net-zero energy construction.

In addition, two CNE employees will also receive work placement training on net-zero energy retrofits. These employees will work with our partner on a retrofit project to be carried out between March and April 2019. The retrofit training will include

- air tightness principles and techniques
- net-zero energy techniques
- wall systems construction
- digital capture techniques for dimensioning existing buildings
- supervising net-zero energy housing projects
- the do's and don'ts in retrofit projects

As part of the training, the partner will conduct follow-up site visits during the construction phase of our NZE projects between 2019 and 2020, thus ensuring the net-zero energy skills are fully integrated and rooted in Eastmain.

Other trades people have expressed an interest in receiving training in electrical and plumbing and HVAC installation and maintenance. The CNE will work with the Cree School Board and its partners to identify training opportunities for local trades. More

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

specifically, the CNE will begin exploring programs with the Cree School Board, CHRD and other vocational schools that offer certification programs in electrical, plumbing, carpentry and heating and ventilation systems. Ideally, training will be provided during the Smart Cities Challenge projects, with the goal of developing these skills in Eastmain within a five-year timeline. The CNE intends to invite skilled external tradespeople to Eastmain to work on NZE projects who will be required to hire local apprentices. It is anticipated that this approach will reduce construction costs because the use of external contractors generally means higher hourly fees and costs associated with travel, and room and board.

The CNE will not only focus on the trades side of the NZE projects but will also identify training opportunities aimed at augmenting project management capacities locally. Eventually, the CNE intends to have local people trained as certified project managers through the Project Management Institute. More importantly, the CNE will look to obtain comprehensive training in cost accounting and MS Project.

One identified area of concern is the need for qualified building inspectors. In fact, the lack of qualified building inspectors who can verify that homes and other constructions have been built to National Building Code standards is often cited as an underlying, contributing factor in the quality of construction projects in the Canadian north. Meanwhile, the CNE is presently training Home inspectors through a program funded by CHRD and offered by Cree Nation Government. These newly qualified Home inspectors will be instrumental in recommending suitable homes for NZE retrofitting to the Cree Nation of Eastmain.

The CNE has also identified other opportunities for capacity-building of the local workforce. These include

- collaborating with the National Research Council (NRC) to develop building science and related construction skills through seasonal employment of a local Indigenous engineering student on NRC building science research projects
- collaborating with Concordia University Department of Building, Civil and Environmental Engineering and the Centre for Zero Energy Building Studies to develop engineering and building science skills in Eastmain, which has a long-term goal of having a Cree engineer and encompasses the opportunity for a local Cree student to
    - ❖ work with the Concordia University data monitoring team to install equipment and collect data on our NZE projects
    - ❖ assist with project oversight and data collection relating to, amongst others, materials, production by trades and costing
    - ❖ enroll in the Engineering Co-op program and have a summer co-op placement in Eastmain

Financial Resources

Both the CNE and Stajune Construction are subject to independent public audit by a financial auditing firm. As part of the Cree Nation of Eastmain's IMS implementation, contractor and supplier management will also be audited throughout the NZE program.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

With the exception of the Smart Cities Challenge winner's prize and revenues that will be generated through the lease or sale of housing units, funding for our NZE program has been secured. In identifying funding, the CNE did not identify government and agency funding programs that may be accessed to complete projects under the NZE program because these must be applied for and, until approved, cannot be considered secured sources of funds. However, the CNE will apply for available funding under different programs.

The CNE financial resources include allocations from the CNE Local Economic Development Fund, the annual subsidies for housing and infrastructure under the Infrastructure Fund, funds from the Housing Action Plan and Cree Nation Government regular program subsidies.

Infrastructure Readiness

The actual construction of net-zero energy homes means that there must be sufficient space and adequate infrastructure to support the new construction. The CNE has recently completed a geomorphic study of the entire community.

Weather is always a risk in the James Bay region. Cold temperatures and snow can arrive early and often stay late into the construction season. The CNE knows that weather often results in delayed completion of construction and the deterioration of materials purchased for projects. While the CNE cannot control weather, it can take steps to mitigate the impacts weather has on its NZE projects. In order to attenuate the impacts that the northern climate has on the timely completion of construction projects and the inherent costs arising from delays, the CNE plans to establish a warehousing facility. The facility will be used to inventory and store construction materials and to assemble certain building components. More importantly though, by having a local warehouse, the CNE can order materials and supplies in bulk for projects before the start of the construction season, avoiding the added delays resulting from transportation times.

The CNE has carefully considered two options for such a facility. An existing warehouse in Eastmain that can be renovated to accommodate the needs of the NZE program, or the CNE can construct a new building. Each option was costed. Renovation of an existing warehouse will cost approximately $450,000 while a new build comes in at around $1,464,613 of which up to 70% can be leveraged through capital funding programs which amounts to almost $1,000,000 of the total cost. This brings the costs of a new build in line with those for the renovation.

The new build, as costed, would be significantly larger, at 8,100 square feet as opposed to 3,500 square feet for the existing facility. In addition, this facility will also be used for the assembly of building components thereby reducing construction times and lowering construction costs while creating employment and economic development opportunities in Eastmain. In light of these benefits, the CNE has chosen to proceed with applying for funding for the construction of a new facility. If approved, the CNE can proceed with construction in 2019. If the CNE is not allocated funding under these programs, it will examine the advantages of renovating an existing warehouse versus scaling the new build smaller in order to be able to carry out construction as funds becomes available.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 5 – Comparison Facility New Build vs Renovation

Options	Description	Building area (sq2)	Cost
1	Existing warehouse renovation	3,500	$450,000.00
2	New building	8,100	$1,464,613 (which includes a maximum grant up to $1M)

The facility, if a new build, will be owned and operated in partnership by the CNE and Stajune Construction as a community project. The new facility would also serve as the offices of the CNE Housing Department and as a maintenance shop. The Housing Department will be responsible for the areas of the facility where bulk ordered construction materials for NZE homes are stored and for the Housing Department's preventive maintenance programs. Another area of the facility will be used for the assembly and storage of the building components.

The facility will allow for the assembly of building components during the months of November to May, eliminating costs that occur from building during winter conditions. As well as increasing the length of the building season, the facility will also take advantage of being able to carry out work in a facility that is dedicated specifically for constructing building components such as wall panels.

The stored materials will be used for housing units constructed under the Smart Cities Challenge, band housing, ongoing housing preventative maintenance programme, the construction of cabinets and the resale of building materials to Eastmain residents who have no local option for attaining building materials for household projects.

In the event the facility is not completed before the CNE must order materials for year 2 of the NZE program, there are other warehouse facilities in the community. These can be used on a short-term basis to store construction materials delivered before completion of the facility and to assemble the building components that will be needed in the upcoming projects.

Project Management Strategies

Our NZE program is ambitious and large-scale. With so many areas of activity it is essential to come up with strategies for addressing issues, managing procurement and supply chain, ensuring outcomes are impactful on the stakeholders and that communications enhance community inclusion. The CNE has systems and processes already in place that are the foundation to its project management strategies.

Risk Identification and Mitigation

All projects face challenges that threaten their success and none more so than construction projects that are vulnerable to weather, supply, transportation and many other factors. The CNE and its partners have identified these risks and designed strategies aimed at avoiding these risks or mitigating their impact on the NZE program.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Since being selected as a Smart Cities finalist, the CNE has identified certain risks that it mitigated by adjusting its NZE program to ensure it can achieve the stated outcomes. More particularly, the CNE had concerns that the timelines, vis-à-vis its present capacity, and financial resources put at risk the success of the NZE program. Consequently, the CNE has modified the timelines and milestones, setting attainable objectives and phasing in parts of its NZE program. By starting with smaller, more contained projects, the CNE will be able to test its processes and procedures and validate its choices to ensure the success of the NZE program.

CNE has also had to re-evaluate its initial proposal after it carried out program costing. Presently, there are no programs in Quebec that support residential applications of solar and alternative energy. As a result, the inclusion of certain net-zero energy technologies added significantly to the costs of construction of NZE homes. In order to control these costs, the CNE has considered constructing net-zero ready homes provided that these homes achieve near net-zero performance and offer the same characteristics in terms of design and resilience. And develop a local "Green Technologies" program to subsidize the purchase and installation of solar photovoltaic systems, similar to programs in other provinces.

There are also risks inherent in relying on technology which may be protected by patent or copyright, difficult to obtain or service or subject to frequent modifications. By relying on commercially-available technology and equipment the CNE will be reassured of their quality and availability as well as the ability to obtain professional technical support when needed.

Table 6 – Risk Analysis

Cause	Risk	Mitigation measures	Risk (3 to 1)
Lack of available workforce	Failure to attain level of local capacity needed for projects	▪ Recruit locally for skilled trades ▪ Train additional tradespeople ▪ Contract/hire externally	2
Design flaws Energy modelling based on assumed data Quality during construction	Failure to reach net-zero targets	▪ Carry out additional data modeling using alternative programs ▪ Use data from weather station to verify assumptions in energy modeling ▪ Re-evaluate NZE construction details and technologies ▪ Implement inspection program and increase frequency of site inspections ▪ Augment net-zero construction training for skilled trades	1
Incorrect estimates of quantity of materials needed Construction modifications on site	Insufficient inventory of construction material	▪ Implement inventory control system ▪ Order materials 8 months before project start date ▪ Order needed materials for shipment to warehouse ▪ Evaluate and improve inventory control and estimates exercise	2

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Unexpected events on site Weather Extra work on site Incorrect productivity and work duration estimates	Failure to meet construction timelines	▪ Apply contractor/supplier management best practices ▪ Apply contract reward/penalty clause ▪ Hire experienced construction PM ▪ Use a project management software ▪ Conduct periodic evaluations of construction and project management processes ▪ Hire additional skilled tradesmen ▪ Implement process improvement measures ▪ Adjust project scope and timelines	1
Unexpected events on site Weather Extra work on site Wrong productivity and works duration estimates Wrong cost estimates	Cost overruns	▪ Implement contractor/supplier management best practices ▪ Hire experienced construction PM ▪ Conduct audit on all construction and project management processes ▪ Adjust project scope and budgets ▪ Identify source of cost overruns and apply audit findings to improve efficiencies	1
	Inability to sell units if purchasers cannot obtain financing	▪ Pre-screen and pre-qualify purchasers ▪ Identify new purchasers ▪ Reclassify private homeownership unit as rent-to-own	2
	Contractor unable to secure necessary financing to carry on construction work	▪ Assist companies in accessing capital funds on a project-by-project basis ▪ Encourage partnerships and joint ventures between companies to improve financial capacity ▪ Manage the project directly through Stajune ▪ Increase CNE investment in the project	2
Fail to do credit check / obtain information on tenant financial capacity	Inadequate rent collection to support operation/maintenance of rental units and to build reserve funds	▪ Pre-qualify renters through credit check ▪ Verify capacity to pay ▪ Credit bureau reporting on delinquent accounts ▪ Ensure agreements are fair to CNE and tenants but protect CNE investment ▪ Terminate rental agreement and evict delinquent tenant ▪ Require solvent co-signer on rental agreements ▪ Sanction arrears by forfeiture of CNE subsidies and application of grants to rental arrears ▪ Suspend eligibility for CNE grants, loans and subsidies to persons with rental arrears ▪ Take legal action	2
Incomplete surveys or site inspection	Ground bearing capacity too low (geotechnical)	▪ Verify ground composition with a geotechnical survey ▪ Mention geotechnical details in contract documentation ▪ Install piles or other system to reinforce foundations	2
	Incomplete building design	▪ Foundation modifications with geotechnical survey ▪ Verify design exceptions (solar panel, insulation, etc.)	2
	Lack of interest from buyers	▪ Explain NZE experience by using pamphlets ▪ Bring out the difference made in community and chance to realise unique projects	2
	Experience in NZE units does not meet occupants' expectations	▪ Confirm occupant satisfaction with the design ▪ Ensure design meets occupants' need before occupancy ▪ Conduct extensive and redesign of future housing units	2
	Negative reaction to living in multi-unit housing	▪ Evaluate underlying issues affecting satisfaction ▪ Elaborate construction strategies to address these issues ▪ Conduct consultation to identify occupants' concerns and needs	2

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

		▪ Develop and implement a strategy that addresses these issues	
	Improper use of building technologies (smart, HVAC, alternative energy, security)	▪ Pre-occupancy education and training ▪ Create/distribute information pamphlets and labels ▪ Carry out inspections and surveys ▪ Train occupants in the use of all technologies	2
Incomplete information given to occupants on their role in NZE program	Occupants do not consent to the collection of personal information	▪ Explain stakeholder engagement that clearly adheres to all PIPEDA principles ▪ Restrict data collection to units where occupants gave consent ▪ Restrict data access to CNE or external, as the case may be ▪ Take steps to alleviate occupants' concerns with data collection	3
Mismanagement of data Database system incomplete or missing	Intentional or unintentional data loss or data security breach	▪ Execution of data storage and security agreements with partners based on PIPEDA principles ▪ Application of CNE ISO/IMS and audit programme ▪ Institute preventive measures and corrective actions identified in the audit programme ▪ Re-evaluate and make necessary changes to data access and security arrangements	2
Collaboration contract not made Terms of the research were not explained or well understood	Resident disengagement from long-term research activities assessing impacts on well-being	▪ Conduct community meetings with partners to discuss relevancy of project objectives to residents' needs ▪ Establish communication plan to engage meaningfully with residents through sharing circles, social media and other forums ▪ Adapt the project continuously to reflect community feedback ▪ Communicate with local CMC workers to identify and address barriers to community engagement	3
	Housing assignment leads to real or perceived iniquity amongst CNE members	▪ Conduct analyses of changes in home and health status and health over time ▪ Identify at-risk sub-population groups based on analyses ▪ Adapt housing policies to implement suitable interventions to populations groups most at-risk for housing inequities	2

**Note: highlighted risks directly linked to KPIs in Table 11.*

***Note: floor plans were designed to allow living area to be reduced by removing rear section from first floor.*

Procurement

In order to control the costs of the NZE projects, the CNE has created a procurement strategy. The strategy was developed with significant consultation with industry stakeholders to ensure its feasibility.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 7 – Procurement Strategy

PURCHASING & EXECUTION STRATEGY			
Purchasing strategy	▪ Benchmark ▪ Use of local workshops ▪ Material transport optimization ▪ Use of cost comparison sheet ▪ Use of progressive billing for each contract ▪ Apply holdbacks ▪ Detailed cost breakdown ▪ Formal tendering process ▪ Use of templated CNE contracts prepared ▪ Bulk material ordering (see project execution strategy)	Project execution strategy	▪ Specially timed purchasing of construction materials ▪ Construct or rehabilitate a facility used to warehouse construction materials ▪ Implementation of processes for inventory control ▪ Purchase large quantity items and carry out procurement in the fall for the following year ▪ Invite specific suppliers to negotiate further on costing and quality of materials ▪ Prepare detailed list of materials used
Approved by	**CNE financial administration**	**Date**	

Important savings can be generated through bulk and specially-timed purchasing of construction materials. As previously explained, the CNE will construct or rehabilitate a facility that can be used to warehouse construction materials. This will enable the CNE to implement processes for inventory control which in turn will play a role in maintaining adequate inventory to complete projects on time and on budget.

Identifying what to purchase will be done when the CNE completes its pilot projects (Accessible House and 1st Retrofit) in year 1 and prepares a list of all materials used.

All procurement of materials and services must comply with the CNE Financial Administration By-law and established policies. This By-law imposes approvals procedures and certification of available funds prior to contracting. Any gaps in the By-law will be filled by procedures aimed at ensuring fairness, openness and transparency in the procurement process that favour accountability and responsibility.

The CNE has established relationships with suppliers to ensure that they understand the procurement process going forward. In addition, the CNE will ensure that it always has a Plan B with an alternate supplier in the event a selected supplier is unable to respond to the NZE project needs. Where appropriate, standardized, templated contracts prepared by the CNE will be used. These contracts set out clear deliverables, timelines and the obligations on each party to favour a constructive, collaborative relationship with suppliers.

Concordia University will be assuming responsibility of procuring the technologies to be used to monitor the performance of the homes. Concordia will contribute $25K to the purchase of equipment. The CNE is actively seeking additional partners to offset costs. If a partner is not found, the CNE will cover the costs through project funds.

Stakeholder Impact and Influence

There are several stakeholders in our NZE program. From residents to local businesses and outside suppliers to governments and agencies, our NZE program will impact these

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

stakeholders in different ways. All stakeholders can impact the success of the NZE program and influence its implementation.

Stakeholder engagement will use the principles set out in the CNE Quality Management System and be auditable within the scope of our Information Management System (ISO/IMS).

Table 8 – Stakeholder Impact and Influence

Stakeholder	Impact on Stakeholder / Stakeholder influence on NZE program
Residents	Most impacted stakeholders as will have opportunity to own or rent an NZE home
	Success of private homeownership program will depend on interest in investing in houses
Suppliers	Impacted by new business and economic development opportunities
	Influence the affordability of NZE housing which will impact success of NZE program
Local Business	Impacted by employment and economic development opportunities
	Influence the success and affordability of our NZE program
Council	Impacted by success of program in fulfilling promise to create a stronger, healthier community
	Influence the success of NZE program through budgetary appropriations and funding
Government Agencies	Influence stakeholder policies and programs by the findings of monitoring and studies
	Influence the success of NZE program through funding programs and policies

Through the program, Eastmain residents will be the most impacted and influential on NZE program success. The opportunity to own a home is gaining momentum in Eastmain as a means for enabling residents who have the financial capacity to move away from the social housing program and fulfill a dream shared by many Canadian - that of having one's own home. Nonetheless, the sale of NZE Private Homeownership Houses will be dependent on the interest and motivation of residents to obtain loans through financial institutions.

The NZE program will have an impact on and influence the sense of community pride. To be enduring though, it is essential that occupants of NZE homes understand the functionality of these homes and the technologies used. The goal is to ensure occupants get the most out of their homes. Consequently, every occupant of an NZE home, regardless of the type of home, will receive training and information on the operation and maintenance of their homes including,

- the use of the monitoring equipment
- cleaning and replacing HRV filters
- programming thermostats
- monitoring solar energy production
- monitoring daily energy use

Suppliers

Suppliers of construction materials will influence the affordability of NZE housing and the ability to sell Private Homeownership Houses in Eastmain. If the costs are excessive, this

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

could prevent expansion of a private housing market. However, Suppliers will have an interest in ensuring success as this can lead to partnerships to provide construction materials to the CNE for its NZE program. The CNE will leverage the potential scope of its NZE program to ensure suppliers see long-term benefits in ensuring affordability.

Local Business

Local construction companies and tradespeople will directly impact the success and affordability of our NZE program. If the costs are excessive, this will limit the number of houses that can be built by the CNE and could put at risk its stated goal of addressing the housing crisis and building a strong, healthy community.

However, the NZE program will be very impactful on local construction companies and tradespeople. There will be substantial opportunities for local construction companies and tradespeople to specialize in assembling building components and gaining NZE building expertise, including opportunities to be licensed as carpenters, electricians, plumbers or HVAC technicians. Construction companies and tradespeople will be assured of year-round work since assembly would be done in the off-season. Moreover, the CNE has put time and effort into identifying and planning training to increase the numbers of skilled tradespeople.

Council

Council will influence the ability of the CNE to carry forward the NZE program. If adequate annual funding contributions are not approved for each of the six years, then the CNE may be unable to carry out all or certain projects in a given year. The NZE program will be particularly impactful on Council if it achieves the stated goal of reducing the backlog in housing and creating a healthy and strong community.

Government Agencies

Through their support of the NZE program, government agencies can influence its success. If funding is provided for training and certification opportunities, for green energy initiatives and for housing, this will supplement funding allocated by Council. This support will fuel immediate, short-term success but will also contribute to the sustainability of our NZE program.

Our NZE program could potentially influence government agencies' thinking and strategies on housing in Indigenous communities.

Communications

The CNE will continue its community engagement process including, the Cree Cafés, general assemblies, housing forums and special community meetings. This engagement process will enable the ongoing assessment of the community's NZE experience and aspirations.

In the 2019-2020 fiscal year, the CNE will also start leveraging social media as a means to receive feedback on its NZE program. This process has already started as the CNE is

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

planning to redefine and redevelop its website so that it offers more and better information to CNE members.

The CNE is also developing a training program for NZE home occupants on the functionality of their NZE homes. This program will include one-on-one sessions delivered by a Cree Nation Government housing specialist.

A project management communication plan was prepared and will be followed in order to implement the construction phase of NZE projects according key performance indicators[4], year after year through the whole project cycle.

Table 9 – Communications Strategy

Communication	Frequency	Goal	Responsible
Project team			
Project status report	Weekly	Review project status and discuss potential issues or delays	Project manager
Team stand up	Daily	Discuss team member activities of previous day and current day, and any obstacles	Project manager
Task progress updates	Daily	Share daily progress made on project tasks	Project manager
Project review	At milestones	Present project deliverables, gather feedback and discuss next steps	Project manager
Post-mortem meeting	At end of project	Assess what worked and what did not work and discuss actionable takeaways	Project manager
Project proponent			
Project status report	Weekly	Review project status and discuss potential issues or delays	Project manager
Project review	At milestones	Present project deliverables gather feedback, and discuss next steps	Project manager

Monitoring, Controlling and Reporting

Monitoring will be essential to ensuring productivity, scheduling and timeframe goals are respected. During construction, daily site visits and inspections will be carried out by the project manager and CNE building inspector. Both will report to the CNE on the advancement of the project(s) and any issues. This process will enable the CNE to monitor project deliverables and major milestones in each project and react, if required, to any issues in a timely manner.

[4] The KPIs are described more fully in the monitoring, controlling and reporting strategies section and Table 7 below.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

The man hours worked, and all materials used will be recorded by an onsite foreman with respect to all labourers and construction material. Having this information is particularly important as it will ensure that the CNE can properly plan the costing and time requirements for the different housing projects.

Table 10 – Monitoring, Controlling and Reporting Strategies

Financial management
▪ SAGE 300 Premium with customized Cost Accounting modules ▪ MS Project Manager add-ons that is auditable to the International Financial Reporting Standards (IFRS) ▪ Chartered accountant
Project management
▪ Experienced project manager responsible for all the monitoring, controlling and reporting ▪ Record of worked man hours by onsite foreman. ▪ During construction, daily site visits and inspections carried out by the project manager building inspector

Technical monitoring			
Monitoring	**Inspection**		
Net-zero monitoring ▪ Hygrothermal performance of the building envelope to ensure durability ▪ Indoor environment quality including (air quality and thermal conditions) ▪ Energy performance including end energy use of HVAC equipment, lighting, appliances and equipment ▪ Energy generation of the photovoltaic system	**#**	**Phases of inspection**	**When**
	1	Foundation	Before backfilling
	2	Framework	Before door and window installation
	3	Tightness	Before drywall installation
	4	Exterior cladding	Before commencing exterior cladding
	5	Interior finishing	Interior finishing

The CNE has an asset management system that includes computerised preventive maintenance management system for the community, which includes the housing department.

An important part of the management plan will include the key performance indicators as presented below.

Table 11 –KPI Tracking

#	Title of Key Performance Indicator	Measure unit	Target value
1	Energy consumption of each unit	kW/h/year	Production equals consumption
2	Indoor environmental quality	Relative Humidity CO2	40– 50 % 350-1000 ppm.
3	Construction cost	$	< 10% budget overrun
4	Number of units	Number of units/year	As planned

The logical framework below is a management tool that gives a summary of a project, in this case the Accessible House project, to describe the project objectives, methods for verification and risks on an outcomes-based methodology.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 12 – Logical Framework for Accessible House pilot

TITLE OF PROJECT: Accessible House Pilot Project	**Project Starts:** Jun 2019 **Project Ends:** Sep 2019 **Date Today:** Nov 2018	
DESCRIPTIVE LEVELS	**METHODS FOR VERIFICATION**	**PROJECT RISKS**
OBJECTIVES ▪ Design a culturally-appropriate accessible house adapted to special needs of individual confined to a wheelchair ▪ Develop construction details for attaining net-zero energy performance to reduce operating costs ▪ Determine level of solar production required to attain net-zero energy performance ▪ Evaluate and develop cost-effective construction techniques to ensure end costs are affordable for social housing	▪ Design verification through interviews with special needs tenant on satisfaction and responsiveness of lay-out ▪ Post occupancy energy monitoring of energy consumption patterns ▪ Verification of net-zero status, including energy performance of the solar system, through extensive energy monitoring ▪ Detailed post-construction evaluation of construction costs and a cost benefit analysis of the construction system and technologies	**OBJECTIVES VS OUTPUTS** ▪ House does not meet the needs of special needs tenant, his caregiver or medical support staff ▪ Building system is not cost-effective ▪ House does not attain net-zero energy status ▪ Tenant does not consent to disclosure of data collected on the project and unable to collect data on individual energy use patterns ▪ Selected tenant refuses to move in or fails to qualify for social housing
OUTPUTS (Expected Results): ▪ Completed Accessible House for Eastmain resident with special needs ▪ Energy monitoring over two years including detailed energy consumption and energy production data ▪ Reporting on the net-zero energy status of the house and its potential for certification as a net zero energy building. If net zero energy status is not attained, strategies for attaining this on subsequent houses will be developed and included ▪ Reporting on the net-zero energy building system, including a cost/benefit analysis of the net-zero building system ▪ Reporting on the house design based on feedback from the tenant, his medical support and the community	▪ Design verification through interviews with tenant on success of the design in addressing special needs ▪ Verification by building inspector that the house meets all code and other requirements ▪ Verification by an energy modeller that the design of the building meets net-zero performance ▪ Confirmation that all suppliers and builders/trades have been paid ▪ Signed lease agreement	**OUTPUTS VS INPUTS:** ▪ Tenant is not satisfied with the unit ▪ Local builders do not cooperate fully ▪ Supply chain is unwilling to negotiate effective cost saving measures ▪ Lack suitable lot for development ▪ Cost of construction is greater than available resources ▪ House does not attain net-zero energy status ▪ Adherence to all project management activities, timetables, and budgets ▪ Construction impacted by weather conditions ▪ Accessible House built according to plans and specifications
INPUTS: ▪ Significant community and individual engagement to develop designs that take into consideration cultural components ▪ Evaluation of the design must-haves of special needs tenant ▪ Evaluate the building system and the capacity required for the alternative energy system (solar) through energy modelling	▪ Submission of bids submitted by contractors and subcontractors ▪ Confirmation of available funds ▪ Preparation and execution of contracts and financial documents ▪ Completion of Tenant Selection Form ▪ Confirmation of lifetime subsidy from CMHC ▪ Confirmation of mortgage from the bank ▪ Receipt of all plans and specifications for construction	**PREREQUISITE CONDITIONS:** ▪ Lot with the proper orientation ▪ Optimum roof angle to maximize solar performance ▪ Local climatic data ▪ Energy requirements of the home based on the building system ▪ Calculation of energy needs and the size of the solar array based on energy needs to meet net zero

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

▪ Develop plans for construction ▪ Engage with supply chain to establish a detailed materials list, costing and cost saving strategies ▪ Engage with local builders in elaboration of the building system and to identify the most cost-effective measures ▪ Engage experienced net-zero builders and skilled tradespeople familiar with the local environment ▪ Project management team experienced in net zero construction and cost accounting ▪ Capital development plan ▪ Available financial resources	▪ Adoption of Council resolution	▪ Working drawings and detailed materials list ▪ Approved budget and secured sources of funding ▪ Contractual agreements that favour local capacity development ▪ Open book agreement with the construction companies to capture actual cost variables such as materials, labour, profit and administration ▪ Engagement with suppliers to develop ways to reduce material and delivery costs, and improve the stock of building supplies available within the community ▪ Occupant qualifies for social housing ▪ Project approval by Council

Sustainability

Table 13 – Sustainability Strategies

SUSTAINABILITY
STRATEGIES
The CNE has implemented various strategies which guarantee sustainability of the NZE program ▪ Taking a holistic approach ▪ Community members and stakeholders involved in defining and designing the NZE program ensuring the project can reach its full potential and respond to the needs of the community ▪ Laws, rules, guidelines and NZE projects discussed with suppliers and builders to ensure that they fully comprehend the framework and the expectations ▪ Through occupant feedback, the CNE will develop new designs and floorplans ▪ Rigorous monitoring and reporting requirements will enhance the level of trust residents have in the program **Training program** ▪ Training opportunities ▪ Hands-on training ▪ Certification opportunities: develop new skills or improve on current skills ▪ Business opportunities: new opportunities for employment and business development ▪ Lead to a stronger more economically and socially viable community The training and capacity building programs are being developed to enhance skills of local tradespeople with respect to net-zero energy construction and retrofits. Ensuring this capacity is essential for addressing the cost of constructing housing in the community, a key component in the SCC proposal. **Business plan for the development of the warehousing/building component assembly facility** This is being done for the purpose of developing a local housing industry and reducing the costs associated with private homeownership. The CNE will consider expanding the type of building components assembled to include roofing systems and foundation systems. This facility may allow the CNE to build a specialized sector supplying building components to other Indigenous and non-indigenous communities.

The CNE NZE program is guaranteed to be sustainable because of the holistic approach taken. From the beginning, community members and stakeholders have been involved in defining and designing the NZE program. This is essential to garnering the support necessary for such an ambitious program, ensuring it can reach its full potential and respond to the needs of the community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The CNE has also discussed the laws, rules, guidelines and NZE projects with suppliers and builders to ensure that they fully comprehend the framework and the expectations but also adjusting the NZE program to respond to certain realities identified by the suppliers and the builders. This step ensures that the NZE program is affordable and therefore attainable.

The monitoring and reporting mechanisms put in place by the CNE will also facilitate the NZE program sustainability. Having rigorous monitoring and reporting requirements will enhance the level of trust residents have in the program and ensure that costs are consistent for each type of housing unit constructed. Past experience has shown the CNE and Eastmain residents that housing costs can vary significantly even for similar housing types built during recent construction seasons, which undermines residents' confidence in the residential construction industry.

Finally, sustainability depends on building capacity in Eastmain. Providing training opportunities, hands-on training, certification opportunities and business opportunities will enable Eastmain residents to develop new skills or improve on skills they already have and offer new opportunities for employment and business development. This can only lead to a stronger more economically and socially viable community and ensure that the NZE program can continue.

The training and capacity building programs are being developed to enhance skills of local tradespeople with respect to net-zero energy construction and retrofits. Ensuring this capacity is essential for addressing the cost of constructing housing in the community, a key component in the SCC proposal.

To continue its NZE program, the CNE is preparing a business plan for the development of the warehousing/building component assembly facility. The CNE will consider expanding the type of building components assembled to include roofing systems and foundation systems. This facility may allow the CNE to build a specialized sector supplying building components to other Indigenous and non-indigenous communities.

As long as there is a demand for housing our NZE program will continue well beyond the Smart Cities Challenge. Our approach has been to establish Eastmain as the expert in the region on building net-zero energy houses. There is a backlog of more than 3,600 houses in Eastmain and the other Cree communities in Eeyou Istchee. This means that the CNENZE program has the potential to continue well beyond the timelines of the Smart Cities Challenge.

CHAPTER 4: TECHNOLOGY

Approach

The CNE's NZE program grounded on the use of smart technologies and construction technologies that are intended to enhance occupants' comfort and enjoyment of their homes and the homes' resiliency and efficiency.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

While the developing the designs for the NZE houses entailed extensive community consultation, the design of the building systems and selection of the systems and technologies required to reach net-zero energy performance was carried out by a small technical team composed of experienced net-zero builders and a design consultant. The Team evaluated available technologies and construction techniques for the design of the systems to be used in the houses. Local builders were also consulted during this process to ensure that the systems and technologies identified for the project could be installed and maintained in Eastmain.

Energy Modelling

The first stage in the design of a net-zero energy building is to identify where energy consumption reductions can be maximized (through the building envelope, housing equipment and technologies) in order to lower the energy production needed to attain the net-zero energy target. This process included

- examining wall systems used in other net-zero housing projects
- drawing from lessons learned on super energy-efficient northern housing prototypes
- drawing from lessons learned on the modelling of other net-zero energy projects
- reviewing ongoing research being carried out in this field of work, including
  - *Panelized Building Systems for Northern Multi-Unit Residential Buildings*, prepared by Cold Climate Building Inc. for NRCan
  - *Design and Construction of Multi Unit Residential Buildings (MURBs) in First Nations communities: Challenges and Opportunities*, prepared for CMHC
  - *Net-Zero Energy Housing: CMHC's Equilibrium Program*

The Team put together by the CNE conducted energy modelling on the Accessible House and the Six-Plex[5] as these would be the first new housing projects constructed under our NZE program.

The Team first evaluated wall systems that had been successfully used on NZE houses in Edmonton, Alberta and other locations. An initial building envelope selection was made based on the experience acquired on net-zero single-and-multi-family builds. In addition to the requirement for net-zero energy performance, the Team took into account Eastmain's climate and the need for durable, easy-to-execute solutions that deliver good occupant comfort and moisture control. At this early stage, the potential for prefabricating the system in a small local warehouse also became a significant consideration.

HOT2000 simulations were conducted on both the Accessible House and the Six-Plex using the same building envelope details for both. Several iterations were run as part of this exercise to test different combinations of building components (See Annex B, C, D and E).

[5] It should be noted that the Six-Plex is a multi-client build that offers the full range of occupancy: private homeownership, rent-to-own and social housing.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

At the same time, the Team ran a HOT2000 file using electric resistance heating and hot water and set the coefficient of performance of the cooling system to 1.0. The exercise delivered some surprising results with HOT2000 showing a cooling load in every month of the year – January to December – in the 7400 heating degree day climate of Eastmain. The annual cooling demand was greater than the annual heating demand.

Table 14 – Accessible House HOT2000 Results

	HOT2000 Homesol (kWh/a) *(adjusted)*	COP	HOT2000 Homesol (kWh/a) *(adjusted)*	HOT 2000 PA (kWh/a)	COP	HOT 2000 PA (kWh/a)	IES VE (kWh/a) w/ Heat Pump COPs
Annual Heating Demand	2774	1.4	1981	2650	1.4	1893	5535
Annual Cooling Demand	8617	3.5	2462	5293	3.5	1512	94
Annual DHW	4395	2.6	1690	5562	1.5	3708	2633
Lighting, Appliances, and Misc Electrical	7000	1	7000	6500	1	6500	6000
Total Annual Energy Required			**13134**			**13613**	**14262**

In both cases, the HOT2000 predictions for peak heating capacity seemed low when compared to the Team's experience with high-performance buildings in Edmonton's milder climate, while the peak cooling load seemed high.

Table 15 – Accessible House Heating and Cooling Loads

	HOT2000 (PA) Peak Watts	HOT2000 (Homesol) Peak Watts	IES VE Peak Watts
Design Heat Loss at -40C	3261	3100	5940
Design Cooling Load at 25C	1605	3600	2900

The results were far enough from expectations that the CNE commissioned ReNu Engineering to run a dynamic energy model using IES VE for comparison (See Annex F).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 16 – Hot 2000 IES VE Energy Modelling Comparison

HOT2000 and IES VE Energy Balance for Accessible House	HOT2000 (kWh/a) *(adjusted)*	COP	HOT2000 (kWh/a) *(adjusted)*	IES VE w/o Heat Pump COPs (kWh/a)	COP	IES VE w/ Heat Pump COPs (kWh/a)
Annual Heating Demand	2774	1.4	1981	8500	2	5535
Annual Cooling Demand	8617	3.5	2462	329	3.5	94
Annual DHW	4395	2.6	1690	6583	2.5	2633
Lighting, Appliances and Miscellaneous Electrical	7000	1	7000	6000	1	6000
Total Annual Energy Required	22786		13134	21411.5		14262
Annual output from 45 – 330-watt PV modules	15500		15500	15500		15500
Potential Annual Surplus	-7286		2366	-5912		1238

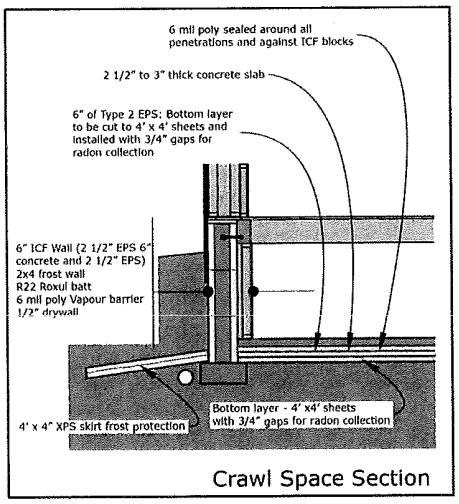
An analysis of the results did not explain the departure from expected results. However, independent longhand calculations based on the hourly weather data for La Grand Riviere, Quebec, a location with similar climatic data, favoured the IES VE results. The Team therefore chose values closer to the IES VE results to calculate the net-zero energy balance.

HOT2000 results for the Six-Plex were similarly surprising. Although these results have not been tested against the IES VE energy model, it will be possible to utilize the significant extra roof capacity of the Six-Plex to install additional solar photovoltaics if it is necessary to increase energy production in order to achieve the net-zero energy target.

The energy modelling exercise was also used to determine the other technologies and building equipment needed to achieve the net-zero energy target. This included assessing windows (fiberglass frame, triple glaze, double low e and argon filled), appliances (top 20% Energy Star performance) and lighting (LED) as well as the size of solar array required.

Based on the modelling, the roof design of the Accessible House was modified to increase the size of the solar array. Modelling also disclosed that solar energy alone would not enable the house to attain the net-zero energy target. Consequently, the Team gave significant consideration to the desirability of using an air-source heat pump versus a ground-source heat pump to ensure net-zero energy performance. Even though lower in energy performance, the Team selected the air-source heat pump because of its significantly lower installation costs and maintenance requirements.

The super insulated envelope, air-tight construction, and energy recovery ventilation system allows for a 90% reduction in annual thermal energy demand intensity relative to typical construction. The significantly reduced thermal energy demand when combined with the high-performance mechanical system and on-site renewable energy generation allows for annual net zero energy consumption. This results in an annual greenhouse gas emissions savings of 861 kg CO_2 eq for the Accessible House as compared to standard construction techniques.



Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The Building System

The selection of building materials and equipment were heavily influenced by Eastmain's remoteness and the impact this has on construction costs and housing affordability. The components of the building envelope were selected on the basis of their

- affordability
- durability
- ability to be constructed by local tradespeople
- ability to deliver the very high level of energy efficiency required for net-zero energy performance in cold climates

Figure 4. Crawlspace Detail.

Typically, houses in Eastmain have been built on full-height poured concrete foundations – a system that is known to be costly and a problem area for mould issues in many houses in the community. For this reason, there was considerable interest in exploring alternative foundation systems for houses to be constructed under the NZE program. Detailed costing and energy modelling were carried out on the use of slab on grade versus a frost-protected shallow foundation (crawlspace). While modelling showed there was very little difference in the energy performance of the two foundation types, consultation with local builders disclosed their concerns with slab on grade foundations vis-à-vis accessibility to plumbing and other household systems. Local builders also indicated that a shallow foundation was more feasible and made it easier to install services. In addition, the Team determined that the site preparation for a shallow foundation is simpler and less susceptible to inclement weather. Based on feedback and these other considerations, the Team selected a frost-protected shallow foundation for the CNENZE program.

The frost-protected shallow foundation will consist of a 4' high, 6" insulated concrete foundation (ICF) wall on an appropriately sized concrete spread footing. The crawl space will be sealed with a continuous air and vapour barrier and included in the heated envelope. The effective insulation of the foundation wall is R-43, the under-slab insulation is R-24 and the footing skirt is R-20. To minimize the use of concrete, an expensive commodity in Eastmain, the foundation wall was reduced to 6" and the under-slab to 3".

All houses constructed under the NZE program will have a double 2x4 cellulose filled wall with a protected interior air/vapour barrier and an exterior airtight water-resistant barrier. The assembly includes a 2 ½" interior insulated cavity to accommodate services. This assembly was chosen because it satisfies all the below criteria.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **The system is economical**
  Double stud 2x4 walls have been consistently shown to be the most economical method of building a high R-value wall, particularly when compared to the commonly used application of layering foam insulation to exterior of wall assemblies.

- **The system is durable**
  High R-value walls generally means a higher risk of condensation on the inside surface of the exterior sheathing. The Team has mitigated this risk in the selected wall system in several ways. Firstly, the wall system will use a well-sealed air-vapour barrier using taped foil-faced fiberboard to substantially reduce infiltration of moisture in the walls. Air leakage in the envelope will be reduced by using the Cossela Dorken Delta Vent SA, a sealed air-tight, vapour open, water-resistant barrier. In addition, the walls will be filled with cellulose insulation, which is highly hydrophilic, to absorb and allow the slow diffusion of any remaining moisture. Diffusion of moisture will be facilitated through diffusion vents installed high in each stud cavity, which will allow any moisture that does accumulate to escape into the vented rain screen. The R-values and air tightness are such that the inside surfaces will remain well above the dew point over a wide range of temperatures thus decreasing the risk of condensation and mould in the NZE houses.

- **The system materials are easily obtained**
  Other than the Delta Vent SA, the water-resistant membrane and the cellulose insulation, all the materials are readily available in Eastmain. The Delta Vent SA membrane and the cellulose insulation are easily found in the normal construction supply chain.

- **The system is buildable by the Eastmain workforce**
  Assembly of the wall system is very similar to standard western platform framing, a common residential construction technique used all over North America. The use of a 2x3 wiring chase inside a sealed foil-faced fiberboard vapour barrier is currently used in a housing project being constructed in Eastmain. The use of exterior rain screens is also common.

- **The system provides excellent energy performance**
  The wall system has an effective R-value of 53. Any increase in the R-value above this level would not be cost-effective because it would provide minimal additional energy savings at a comparatively high cost.

The Team selected fiberglass framed, triple glazed, argon filled sealed window units with 2-Cardinal LoE272 coatings. The roof cavity will be configured to offer a total R-80 (approximately 24") of cellulose insulation. The ceiling vapour barrier will be installed and sealed to the bottom of the trusses and supported with 2x3 strapping 24" on centre prior to building the interior partitions which will provide a chase for electrical wiring without penetrating the air/vapour barrier.

Particular attention was given to the selection of a Heat Recovery Ventilator (HRV). HRVs have been used in Eastmain homes for several years, but their performance has been inadequate. Often, the performance issues arise from improper HRV installation, or the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

decision by occupants to turn the HRV off because of (a) a misperception that these contribute to high energy costs, (b) noise, and (c) the impression that cold air enters the home through the HRV. The poor performance of HRVs in Eastmain, regardless of the reasons, reflects one of the ongoing challenges to maintaining healthy indoor environments in houses across the Canadian north.

In order to address this issue, the Team worked with an HVAC consultant to design an HVAC system for the NZE program. The Team carried out a second modelling exercise using dynamic IES VE 3D building performance analysis software to confirm findings and further evaluate air conditioning requirements. Based on this modelling exercise, the Team finalized the design of the building system and construction details and made changes to the roof design to allow for additional photovoltaics. The energy modelling was then finalized using these selections (See Annex G).

Our Technologies

A wide range of technologies will be introduced to the community through the CNENZE program. All these technologies, including new technologies not yet used in the community, are commercially available.

The technologies selected have a role in ensuring the NZE program attains the net-zero target, in monitoring and evaluating the houses and in building the houses. The Team evaluated energy saving and energy producing technologies including the building system (i.e. the design and construction of a foundation, walls and ceiling), building components (windows, doors, lighting, etc.), the HVAC system, and the solar photovoltaics.

Net-Zero Energy Housing

Although net-zero energy homes are not new to Canada, they are new to the Canadian North and to the Eeyou Istchee. Throughout Canada, innovations in the residential construction industry are developed locally and regionally, and innovations developed in one region must be tested in another. In each of Canada Mortgage and Housing Corporation's Equilibrium projects, for example, innovation focused on the specific combination of building systems and technologies that were used to achieve net-zero. For this reason, the Equilibrium programme targeted the development of net-zero energy housing prototypes across the country, except the north. The net-zero energy innovations also focussed on developing and refining construction processes to ensure that net-zero energy homes are competitive on a cost-benefit basis. This has been the same focus in Eastmain.

The CNE will ensure it builds capacity locally with respect to new technologies and systems being introduced into the community under the NZE program. As such, capacity building will be provided in areas such as solar photovoltaics, air-source heat pumps, energy monitoring technologies and smart home technologies.

Net Zero Energy Technologies

The Team evaluated the energy saving and energy producing technologies required to satisfy a net-zero energy performance standard. The evaluation included selecting the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

materials required for the design and construction of the building envelope (i.e. foundation, walls and ceiling), the building components (windows, lighting, etc.), the design of the HVAC system and the size of the solar photovoltaic system. More specifically, the Team selected

- **Double 2x4 Wall System**
  The Team chose a wall system that is used extensively in Alberta, Saskatchewan and the Yukon. The system can be used on both new construction and on net-zero energy retrofits, and it can be assembled on site or prefabricated in a small local shop. This latter characteristic was important as it falls in line with the Cree Nation of Eastmain's plan to construct or rehabilitate facility where wall systems can be assembled locally. Even though prefabricated wall systems have been used in remote communities, the CNE project to create a facility where these can be assembled in a remote community is innovative.

- **Building Components**
  All the building components, including windows, doors, lighting and appliances were carefully selected to ensure that the wall systems would perform to a net-zero energy standard. The Team selected the following components for the NZE program, which will first be used in the construction of the Accessible House
  - Duxton Fiberglass frame, triple glaze, 2-low E coatings, argon filled windows
  - Energy Star certified LED lighting will be installed

- **Solar Photovoltaics**
  As well as being essential to achieving net-zero energy performance, the solar component of the NZE program could potentially satisfy household electrical needs during blackouts. The photovoltaic system that will be used in the NZE houses will be sized according to the net-zero energy needs of each house. All NZE houses will be designed so that the necessary solar panels can be installed directly on the roof of the house.

  In the case of the Accessible House, the solar array (i.e. the number of solar panels) is composed of 45 panels, each producing an output of 330 watts, to meet the energy production target of 14,309 installed watts. Electricity production from the solar array will be tied into the Hydro-Quebec electrical grid. Excess power produced through the solar photovoltaic system will be sold to the grid and bought back from the grid when supply from the system falls below household requirements.

- **Heating, Cooling and Ventilation**
  ReNu Engineering designed the HVAC system to satisfy the heating and ventilation needs of the house while ensuring the house can meet the net-zero energy target. The HVAC equipment includes
  - a VanEE 2400 (with an ECM fan) Heat Recovery Ventilator (HRV)
  - a Fujitsu Halcyon Mini-Split RLS Air Source Heat Pump
  - an AO Smith Proline XE HPTU-66N Hot Water Tank (HWT)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **Wood Heat**
  The use of wood heat in residential applications in the North is common. Feedback from residents during the initial consultations on housing designs, many residents suggested using a backup wood heating system that will ensure houses can be heated during power outages. A Droulet Blackcomb air-tight wood stove will be installed in the Accessible House.

- **Smart Home Technologies**
  Equipment that will enable occupants to remotely monitor the operation of their homes, including
  - Z-wave enabled smart home accessories that monitor home security, water infiltration, frozen pipes and carbon monoxide
  - programmable smart thermostats

- **Appliances**

Occupants are responsible for obtaining appliances. However, to assist them with this task and ensure that every component in the house contributes to the net-zero energy target for that house, the CNE will give occupants a list of recommended ENERGY STAR® appliances. The recommended appliances must be affordable while also ranking in the top 20% of ENERGY STAR® rated appliances, a performance level that was determined through the energy modelling exercise. This will include a selection of refrigerators, ranges, dishwashers and washer - dryers.

- **Solar Generated Battery Storage**

Presently, the cost of battery storage for the loads required during the coldest winter months is prohibitive. The cost of solar panels has fallen dramatically over the past 5 years and a similar trend is starting to happen with battery storage systems. The CNE will track developments in the advancement of battery storage technology and expects that, over the next several years, the cost of battery storage will fall significantly. Battery storage will be introduced into NZE houses when the technology and the cost justify its use. When battery storage is introduced, it will be sized to provide emergency support to house operations (limited lighting, fridges, freezers) and enable occupants to survive extended power outages.

Energy and IAQ Monitoring Technologies

Net-energy zero houses constructed under our NZE program will be evaluated even after construction in order to validate their net-zero energy performance. The CNE wants to learn as much as it can from its housing projects to continually improve its housing program. The CNE will carry out extensive energy monitoring of each of the initial housing prototypes and a sampling of future NZE houses. Energy monitoring will include

- blower door testing to confirm air tightness of the building envelope[6]

[6] The Cree Nation of Eastmain NZE program has adopted the "Passive House" airtightness standard (i.e. a minimum air tightness level of 0.6 air changes per hour (ACH) at 50 pascals) as it is considered by net-zero energy builders and energy modellers to be the most rigorous air tightness standard in the industry.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- detailed data collection over at least one year on energy production from the solar panels
- detailed monitoring of the energy used by occupants, after occupancy, throughout the house including
  - energy consumed by the air-source heat pump and the heat recovery ventilator (HRV)
  - household energy consumption for lighting, cooking, hot water and other uses

For the purposes of the energy monitoring activities to be carried out under its NZE program, the CNE has partnered with the Concordia University School of Engineering's Centre for Zero Energy Building Studies (Concordia). With the technical team, Concordia developed a monitoring protocol and programme and identified the equipment to be used. Measuring the performance of the NZE houses and confirming that they are performing at the net-zero energy standard is a significant component of the performance measurement aspect of our NZE program.

The technologies and equipment for this work are as follows

- Hygrothermal and indoor air quality monitoring equipment including
  - relative humidity and temperature sensors to measure humidity and temperature levels inside the building and its envelope
  - wood moisture content and temperature sensors to determine the moisture level of wood-based materials in the building envelope
  - carbon dioxide sensors to measure indoor air quality
  - a compact weather station to provide local micro-climatic conditions related to temperature, humidity, wind and solar radiation
- a blower door, thermographic camera and other equipment to measure airtightness and detect any perforations in the building envelope
- energy use and production monitoring equipment including
  - a PV energy generation logging device
  - end-use energy use monitoring systems subdivided into heating, ventilation, appliances, lighting and plug loads
  - HRV temperature and flow rate monitoring to determine the HRV efficiency and operation schedule
  - data loggers equipped with backup battery power

In addition to monitoring the performance of the houses, Concordia will carry out research activities on ways to enhance the energy performance of the NZE houses that includes

- installing a building-integrated photovoltaic and thermal (BIPV/T) roof system that involves
  - integrating the photovoltaic system into the roofing material of the building envelope to minimize the amount of building material used and enhance aesthetics

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- ❖ using the cavity between the photovoltaic roof panels as a duct where outdoor air can be drawn and pre-heated for the HRV indoor air intake and monitoring the increased efficiency of the solar panels from the cooling of the panels
- ❖ using the outdoor preheated air to preheat the ventilation air system

- using the insulated thermal mass of the crawl space for thermal storage
- evaluating the benefits of using an automated shading device on windows facing south, west and east as a way to reduce heat gains and the need for air conditioning in summer.

Monitoring equipment will be placed as follows.

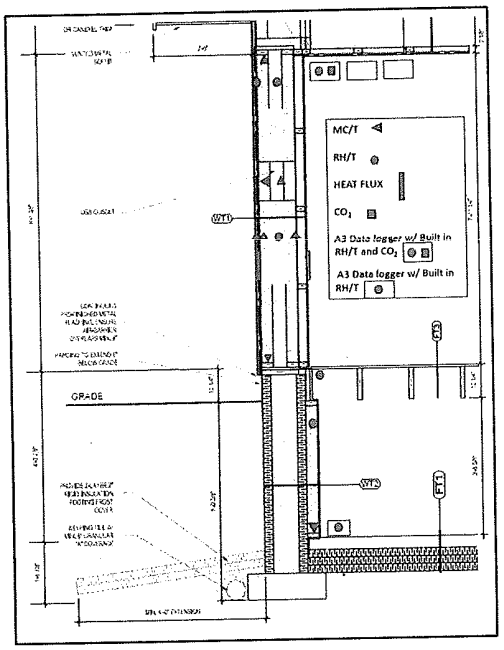


Table 17 – Monitoring Equipment Placement

Location	Equipment
Indoor	A3 wireless CO_2 data logger w/ integrated RH/T (4 resistance channels and 3 voltage channels)
	CO_2 sensor
	A2 wireless data logger w/ built in RH/T and MC
Wall	Point moisture measurement sensor
	RH/T sensor
Attic	A3 NEMA data logger w/ integrated RH/T (4V & 4R)
	RH/T sensor
	Point moisture measurement sensor
Crawl Space	A3 NEMA datalogger w/ integrated RH/T (4V & 4R)
	Point moisture measurement sensor
	RH/T sensor
System	I3 gateway interface
	Building intelligence gateway computer
Roof	Solar radiation sensor
	A2 Wireless Data Logger (with built in RH/T and MC
HRV	Air flow meter
	RTD temperature sensor
	RH/T Sensor
Energy	Watt-hour meter
Outdoors	Weather station

The below figure shows the location inside the house of the performance monitoring equipment.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Figure 5. Wall section sensor layout.

Building System Assembly Technologies

Specific construction equipment and machinery will be used in the facility that will be constructed or rehabilitated by the CNE for the assembly of building components to be used in the new and the retrofitted NZE houses. This equipment includes

- carpentry and cabinet-making tools like cut-off saws, nails guns and drills
- air compressors
- A skyjack or boom truck
- a bridge crane

Approach to Future Proofing Technologies

All of the technologies being employed in our NZE program are standard and commercially available, selected on the basis of quality, energy performance, cost and simplicity of installation and maintenance. At some point, the equipment will need repair or replacement, however other than these normal foreseeable events, no other issues are anticipated.

The biggest technological challenge arises from the absence of any a local skilled electrical or HVAC tradespeople. This will make the installation and replacement of equipment, as well as routine maintenance and repair, very expensive. To address this issue, the CNE will focus on building capacity locally by training local tradespeople on the installation and maintenance of HRVs and air-source heat pumps. However, this is a long-term plan because HRV technicians must complete a 3-year apprenticeship.

Having chosen to use air-source heat pump technology, the CNE NZE program is vulnerable because it will have to rely on external technicians in the event of breakdowns. All houses are at risk of freezing in the event of heating system failure. However, given the low heat loss expected of the NZE houses and the inclusion of a backup wood heating appliance, these houses should be protected against freezing up and occupants will be able to remain comfortably in their homes until the heating system can be repaired.

Legislative Compliance

All applicable codes and standards were observed in the elaboration of the housing designs. The building system meets the structural requirements of the *National Building Code of Canada* (the "Code"), while dramatically surpassing the energy performance targets of the Code, and complies with other applicable federal and provincial legislation.

Gauging the net-zero energy performance was done using the HOT2000 software developed by Natural Resources Canada (NRCan) and a comparative modelling using the IES VE Energy modelling software. The CNE engaged skilled energy modellers and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Accessible Design

The Accessible House features were designed to meet the accessibility requirements of the Code and applicable legislation. To create the Accessible House design the CNE drew upon the feedback received during community consultations, including caregivers and first responders. Guides and standards referenced in the design of the accessibility features of the Accessible House include the Canadian Standards Association "Accessible Design for the Built Environment" (CSA B651-12) and CMHC's "Accessible Housing Design Guides" (See Annex H).

Scalability and Replicability

The CNE NZE program is shown to be scalable. The designs and technologies are easily adaptable to respond to the different needs and capacities. The CNE has developed a scalable housing program that offers various sizes of housing to a variety of clientele.

The CNE plans to develop a guide setting out the processes for implementation of future net-zero energy initiatives that can be used as a framework by other Indigenous and non-Indigenous communities.

Technology Partners' Roles and Responsibilities

To design and develop its NZE program, the CNE built a team of skilled designers and technicians with extensive experience in the design, construction and evaluation of net-zero energy housing including

- **Bill Semple, NORdec Consulting and Design**
  Bill led the extensive community consultations carried out to gather input on the design of our NZE program housing prototypes and designed the Six-Plex, the Accessible House, the Cree Elders House, the Private Homeownership unit and the Starter House. Bill led the technical team that carried out the evaluation of the construction details, the net-zero energy modelling exercise, and the selection of all materials and equipment to be used in our NZE program. Bill developed the working drawings for the project and will assist in developing the capacity-building program for the NZE project.

- **Peter Amerongen**
  A leader in net-zero residential construction, Peter led the design of the building system and the net-zero energy evaluation. He identified and selected the materials and equipment required to achieve the net-zero energy and will help with the design of the capacity-building and training program for net-zero building techniques and the assembly facility.

- **Homesol Building Solutions**
  Homesol Building Solutions Inc. is an expert in green building and energy design consulting, energy modeling, ratings, labels and has verified building performance solutions for projects throughout North America. It was responsible for the energy modelling and evaluation of the net-zero energy status of the Six-Plex and the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

used accepted industry software to evaluate energy performance of the NZE houses and confirm that they will satisfy the net-zero energy targets.

The Government of Canada (GOC) is currently developing a "net-zero energy ready" model national building code as well as a model energy code for existing buildings. The CNE NZE program will satisfy the standards established in these codes and, in so doing, lay the groundwork for other Indigenous communities to create energy-efficient housing programs.

Development of Standards and Guidelines

The CNE intends to use the experience gained during its NZE housing program to create local standards and guidelines reflect the innovative combination of technologies, processes and systems that will facilitate the scalability and transferability of its program.

Interoperability of the Technologies

Several standards and guidelines were relied upon to develop the CNE NZE program and to design NZE houses under this program. The CNE has built on these standards and guidelines to create a program that reflects its reality and responds to its needs and capacities. The various standards and guidelines that the CNE referenced in designing its NZE program and the building systems have resulted in new combinations and interoperability between technologies.

HVAC Design

The design of the heating, ventilation and air-conditioning system (HVAC) for the Accessible House drew upon several standards. The air-source heat pump size was based on the HOT2000 load calculations. Heating and cooling loads will be met by a Fujitsu Halcyon Mini-Split Air Source Heat Pump. The sizing of the HRV and design of the duct system was established to meet CSA F326. Finally, rounding out the HVAC system, the CNE will integrate a high-performance, air-tight Droulet Blackcomb wood stove to provide a backup heat source.

Photovoltaic System

The photovoltaic array was calculated as part of the energy modelling exercise for the Accessible House and is based on the energy production requirements needed to meet the net-zero energy target. It was found that a photovoltaic array producing at least 14,309 watts is required for net-zero energy performance. The photovoltaic array will be made up of 45 panels, each with an output of 330 watts. Under Hydro-Quebec's "Net Metering Rate Option for Self-Generators", each of the NZE homes will be connected to the Hydro-Quebec grid and will use net metering. Under the scheme, the Hydro-Quebec grid will become the "storage system" for excess electricity produced by the photovoltaic system and "sold" to the grid. The amount of energy produced will be deducted from the amount used in calculating the household electricity bill.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- ISO 9001 Quality Management System (QMS) to ensure that CNE meets its community members' infrastructure needs as well as of the SCC solution itself
- ISO/IEC 20000-1 Service Management System (SMS) for the IT services supporting CNE and SCC
- ISO/IEC 27001 Information Security Management System (ISMS) for the protection and monitoring of CNE's information, data, privacy, security, and accessibility.

These systems are enabling CNE to plan, deliver, verify and improve on projects, programs and services. Under the ISO/IMS, the CNE is required to capture stakeholder needs and requirements when designing and developing of any new initiatives, like the Smart Cities Challenge, by using best practices and continuously seeking opportunities for improvement. As an audited, documentation-based system, the ISO/IMS will provide substantiated evidence of the project, from start to finish, making it packageable, transferable and reproducible.

Integrating an ISO/IMS into the SCC is not only novel and innovative in terms of its application of use in this context, but also in terms of its ability to enable CNE to capture and replicate this project to share with other communities. This unique approach will also enable an appropriate level of oversight over the SCC work processes to ensure success at every stage of its implementation. This level of risk management and pursuit of continuous improvement serves as a predictive indicator of failure-causing events, which in turn, makes them easier to avoid.

An investment into a systematic approach at capturing future value in best practices that have been developed within a local community can multiply the beneficial effect across other communities, with structure, discipline, accountability, transparency and quality housing.

Cree Laws and Policies

In this respect, the CNE must comply with the procedures set out in its financial and administrative laws with respect to expenditures and contracting. Budgets must be prepared by the Treasurer and approved by Council. Monies to be allocated to services and programs must be included in the budgets or supplementary budgets and approved by Council resolution. With the exception of borrowing for housing, long-term borrowing must be approved by Council and ratified by the electors of the Cree Nation of Eastmain.

Each year, the CNE is subject to audit of its financial statements. The auditors conduct an extensive examination of Council resolutions, contracts, purchase orders and payments to ensure that spending is done in compliance with the Cree law.

Activities under our NZE program that involve an expenditure of funds must use administrative and financial management tools that ensure the good financial management of resources. These tools include templated contracts, purchase orders, and budgets and financial statements on a project-by-project basis.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

assets. These agreements together provide long-term predictability of funding to the Cree Nation of Eastmain.

Council is the local government authority and has responsibilities set out in the *Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada* and the Constitution of the Crees of Eeyou Istchee, as well as under the Cree laws enacted pursuant to these instruments.

ISO/IMS

According to the World Bank, good governance "entails sound public sector management (efficiency, effectiveness and economy), accountability, exchange and free flow of information (transparency), and a legal framework for development (justice, respect for human rights and liberties).[7]" In accepting this definition of governance as one of the underpinnings of community success, the CNE has integrated the spirit of the Smart Cities Challenge. If the CNE promises to adhere to the principles of good governance, it must systematically govern itself. Its strategy, direction, and oversight will only be as effective and as functional as the management systems used to deploy them.

Its acknowledgment of the need for sustainable programs, capable of providing value to the community over time, incited the CNE to develop its ISO Integrated Management System (ISO/IMS) to manage the future growth and challenges of the community. The ISO/IMS provides clear direction and continuous feedback to decision-makers and sets a foundation for trust in the operations of the Cree Nation of Eastmain.

Cree Nation of Eastmain's Smart Cities Challenge governance approach is to integrate the NZE program into the design and development of its ISO/IMS in order to capture its ability to deliver reproducible quality outcomes with a measured degree of reliability. Lessons learned throughout the project, captured as best practices, will be systematically incorporated into NZE program documentation.

Because it is composed of system "modules", the ISO/IMS processes can all be captured and prioritized and implemented in a phased approach to help ensure the appropriate controls, such as transparency, privacy, and accessibility are in place as and when needed.

Through an iterative development approach that sets up the Smart Cities project processes to be executed, together with the capture of their relative performance for continuous improvement purposes, CNE will be developing a turn-key model of not only the housing solution itself, but also of the governance and management systems models that enable them to be sustained.

CNE's governance framework model employs the discipline and traceability of three distinct management systems:

[7] United Nations Economic and Social Council Committee of Experts on Public Administration Fifth session New York, 27-31 March 2006 Agenda item 5 —Compendium of basic terminology in governance and public administration E/C.16/2006/4 *Definition of basic concepts and terminologies in governance and public administration*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Builders and local tradespeople will be trained in net-zero energy building systems. By participating in the construction of NZE houses, builders and tradespeople will gain first-hand knowledge and net-zero experience. The repetitive application of the net-zero energy construction techniques should lead to a reduction in housing construction costs.

The HVAC Contractor will be introduced to the installation and use of air-source heat pumps and high efficiency HRVs. The air-source heat pump was selected because of its usability and ease of installation and maintenance.

Occupants will be introduced to and be given assistance on the use of the different technologies used in the NZE program. More particularly, occupants will learn to use programmable thermostats and smart home accessories to monitor home security, detect water leakage and track carbon monoxide levels, and online tracking of their energy consumption patterns and energy production through a dedicated website.

If occupants give their consent, the Housing Department may provide on-site support for remote monitoring carried out on the houses such as rebooting computers, changing batteries in the monitoring equipment as needed and mitigating risks. Furthermore, the Department may have access to monitoring equipment and data collected including energy monitoring data, production data and will have access to material cost breakdowns.

Identification of Risks

Data Security

To ensure data integrity, the NZE program data collection system will be able to operate as a stand-alone system to protect the security and integrity of the data without requiring third party analytics software.

There are measures that can be implemented to ensure data integrity and protect it from unauthorized access. Data collected will be communicated to a cloud-based server for analytics and will use a Secure Socket Layer (SSL) to maintain an encrypted link between the web server and browser. Custom access levels to the data can be given such as, read/write to authorized personnel and read only access for open data sharing.

CHAPTER 5: GOVERNANCE

Good governance practices and guidelines are essential to ensuring that government actions are fair and responsible and carried out in an open, transparent and accountable manner. The CNE adheres to good governance principles.

Governance Frameworks and Strategies

The CNE was a signatory to Canada's first modern-day treaty and a number of subsequent agreements reaffirming its right to self-government and to control its land and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Accessible House. Homesol assisted in the development of the construction details and the selection of mechanical equipment.

- **Concordia University**
  Concordia University's Centre for Zero Building Studies is responsible for the energy monitoring program that will commence with the Accessible House and the NZE retrofit. This will include a breakdown of household energy use patterns including heating, cooling, hot water, appliances, monitoring energy production of the photovoltaic array, monitoring energy production of the air-source heat pump, and monitoring indoor air quality by tracking of CO_2 and humidity levels in the house (See Annex I).

- **McGill University**
  McGill University's Institute of Health and Social Policy will undertake a research project to develop and implement culturally-appropriate research methodologies for monitoring and assessing the results of the NZE housing program at every step. This will include studying the links between housing and individual, family and community well-being (See Annex J).

- **CMHC**
  Canada Mortgage and Housing Corporation provided financial support for the community engagement process and funding for the McGill University research project. In addition, has programs to support ongoing monitoring and evaluation of NZE houses as well as capacity-building. CMHC has acknowledged the importance of the social, financial and technical innovations of our NZE program and expressed interest in the research being carried out (See Annex K).

- **ReNu Engineering**
  ReNu Engineering is an Edmonton company specializing in building performance and energy efficiency. ReNu was responsible for conducting a comparative analysis of different HVAC options and developed the design and conceptual drafting of construction drawings for the selected HVAC system. ReNu also carried out a second energy modelling analysis on the Accessible House to confirm the net-zero energy target using the dynamic IES VE 3D building performance analysis software.

- **Cree Human Resources Development (CHRD)**
  CHRD has funding programs for capacity development that are available to the Cree Nation of Eastmain. CHRD has already contributed financially under its Youth Program that allowed three CNE youth to work with the Project Management Team. The CNE will continue to apply for CHRD funding throughout its NZE program.

Accessibility and Usability of the Technologies

The technologies employed in our NZE program will have a direct and indirect impact on the various stakeholders who will have access to the technologies and the data collected by these technologies.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Project Management

Under our NZE housing program, Council and the Project Management Team will review program needs and make decisions on project funding on an annual basis and as needed to respond to program requirements. The Project Management Team will have an obligation to report to Council and to the members on the use of Cree Nation of Eastmain's NZE program contributions. All such reporting will be done at public meetings to ensure the transparency of the NZE program activities and enhance the accountability of the Cree Nation of Eastmain.

Our NZE program governance framework will be made up of a two-tier project management system. One tier will manage the NZE program and provide technical support, the other will manage project construction activities and costs. The purpose of this structure is to minimize risks and improve chances of success. All construction projects will be supported by a team of experts making sure that construction can be completed on time and on budget.

The Project Management Team will be responsible for

- obtaining funding for the NZE program and construction activities
- carrying out all design review and changes
- evaluating and approving all change orders
- overseeing all aspects of the NZE program.
- evaluating the project to ensure compliance with building code and other standards
- tracking all materials, orders and costs as well as labour costs
- developing the capacity-building program and overseeing its implementation

The construction project manager will be responsible for

- tendering and contracting with contractors
- establishing and undertaking a material inventory control system
- undertaking the assembly of building components to avoid seasonal impacts
- ensuring construction projects are started and completed on time
- monitoring contract performance
- providing proper site supervision
- controlling costs

Partners and Resource, Capacity, Roles and Readiness

The CNE will work closely with its partners Concordia University, McGill University, Renu Engineering, Canada Mortgage and Housing Corporation (CMHC) and Cree Human Resources and Development. The partners' roles in our NZE program is determined by their respective sphere of activity and expertise. Each of our partners has the capacity needed to contribute to the success of our NZE program.

Concordia University will carry out all the quantitative data collection as well as the storage and protection of this data. McGill University (McGill) will collect qualitative data relating to occupant experience and will also be responsible for the storage and protection of this data. McGill will ensure that data it collects under our NZE program is anonymized prior to disclosure to our program partners or any third party

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

CMHC has approved a three-year project for the CNE McGill to carry out qualitative research on the occupants and resident's response to the NZE houses and NZE retrofits. The Contribution Agreement has been approved in principle with wording relating to intellectual property rights and privacy to be finalized.

Concordia University

Concordia University Department of Civil and Environmental Engineering's Centre for Zero Energy Building Studies (Concordia), is one of the leading research institutes on net-zero energy buildings in Canada. Dr. Andreas Athienitis, Director of the Centre and Scientific Director of the Natural Sciences and Engineering Research Council of Canada (NSERC) Smart Net-Zero Energy Buildings Strategic Network, is known at home and abroad for his work promoting net-zero energy buildings. His extensive work in this area has enabled Concordia to build significant capacity in this field, with several professors and graduate students specializing in net-zero energy and solar buildings. Concordia will carry out extensive field monitoring of the houses built under the CNE NZE program which will serve as a model for a framework that can be replicated in other northern communities. Field testing will be carried out by Concordia graduate students, supported by Dr. Athienitis and Dr. Hua Ge.

McGill University

Qualitative research on our NZE project will be carried out by the McGill Department of Geography Institute for Health and Social Policy's Place, Health and Well-being Research Group. Led by Dr. Mylene Riva, Assistant Professor at the Institute and the Department, the research group will examine the social and environmental determinants of health and well-being among Indigenous and non-Indigenous peoples. The extensive field research to be carried out in Eastmain, will build upon a previous project carried out in Nunavik on Housing, Health and Well-being in the Artic. The research activities will be undertaken by graduate students from the Department under the supervision of Dr. Riva. The research work will examine the links between housing and individual, family and community well-being.

Control over Sensitive and Personal Data

The CNE and its partners are all responsible for compliance with data protection and privacy obligations.

Data collected in the context of our NZE program will remain the intellectual property of the Cree Nation of Eastmain. The public disclosure of any such information requires the Cree Nation of Eastmain's prior consent.

Any disclosure of information collected under the auspices of our NZE program must first be anonymized and all personal identifying information removed. The CNE intends to enter into memoranda of understanding with its partners, and other person involved in our NZE program, to ensure compliance with the *Personal Information Protection and Electronic Documents Act* (PIPEDA).

Risk Management

Below are some of the risks relating to governance that have been identified along with the steps take to avoid these risks or to remedy them.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 18 – Risk Identification, Prevention and Correction

Risks	Preventive Measures	Corrective Measures
Changes in Council priorities that negatively impact funding commitments for NZE program	Keep Council informed of benefits of NZE program and its importance	Seek additional investment and financing.
Changes to government policies		Adjust the project according
Contract disputes	Ensure effective supplier/contract management is in place	Bring the interested parties together to mediate a solution
Partner withdrawal from the program	▪ Good leadership ▪ Healthy communications to identify issues early ▪ Effective engagement	Establish new partnerships

CHAPTER 6: COMMUNITY ENGAGEMENT

Approach to Engagement

In order to enhance the success of its Housing programs, the CNE is working toward increasing the residents' understanding of its Housing Policies and programs so that they can fully take advantage of these. The Housing Policies are currently being reviewed and during this process, ongoing discussions, information sessions and workshops will be used to educate and gather input from residents on these policies. Community engagement has always been the preferred method for the Housing Department to obtain feedback and ideas from Eastmain residents. Key strategies that we have used to support the Cree Nation of Eastmain's efforts to inform and educate residents include

- developing a Tenant Guide Booklet to be provided to every household
- holding information sessions and workshops for community members on Home Ownership and Tenant Responsibility
- doing monthly Radio Talk Shows on Housing matters
- organizing CMHC-sponsored workshops for tenants and maintenance workers on mould issues, indoor air quality, basic home maintenance, and Section 95 Housing.

Cree Nation of Eastmain's Sustainable City Challenge Statement, "Improving Community Well-Being", evolved from a series of meetings between Chief and Council and the CNE Housing Committee, and numerous informal and formal discussions with elders and other residents. During this engagement process, the CNE became acutely aware of the ongoing issues that residents have with housing designs, construction standards and the operations of mechanical systems. As such, broader consultation was carried out on these issues at community meetings, design workshops and home visits. Community events included

- Workshops/Charrettes (2017 and 2018)
- Annual General Assemblies/Cree Café (2017 and 2018)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- Meetings/consultations with users (tenants and occupants), and professionals (caregivers, first time responders etc.)
- Special Events
  - Housing Forum (2018)
  - Builders Forum (2018)

Consultations, home visits and workshops were held in June 2017 with the focus of gathering residents' ideas on the design of various housing prototypes. This initial consultation process was followed up by workshops in January 2018 where preliminary plans for the Cree Elders House, the Starter House and the Six-Plex were presented, and residents were invited to comment on these. Consultation was held in the summer of 2018 on the design of the Accessible House.

Annual General Assemblies

The CNE holds regular Annual General Assemblies (AGAs) to receive members' ideas such as topics on ways for improving housing in the community. Break-out groups during the AGAs allow smaller focus groups to explore questions in greater depth.

At the 2017 meeting, the Housing Department presented designs for a Cree Elders' House (Annex L), an Elders' Community (Annex M) and a Starter House (Annex N). A housing booth was set up so members could review the preliminary plans, ask questions and comment on the house designs. The CNE received positive feedback on the designs. Members also expressed their desire to see more durable and energy-efficient homes built in the community. The incorporation of culturally-appropriate features, the installation of solar panels and the use of thicker, better insulated walls were a starting point for further discussions around making houses more sustainable.

CNE Housing Forum

In February 2018, as a continuation of the community engagement process, a Housing Forum, with a focus on obtaining members' input on CNE housing needs and the Smart City Challenge, was held. The Housing Forum was devised to enable the sharing of information and gather members' input on the Smart Cities Challenge, the Cree Nation of Eastmain's proposal to create an NZE Housing Program and the preliminary design for a culturally-appropriate NZE Six-Plex.

Reflecting a trend that is emerging in many northern Indigenous communities, multi-unit housing is being promoted as a means to reduce land development and construction costs, improve energy efficiency and enhance the sustainability of the community. The Housing Forum gave members information and a chance to exchange ideas on

- the Smart Cities Challenge
- the proposed NZE housing program
- energy efficiency targets, technologies and the building systems used to reach these targets

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- lessons learned from other successful NZE projects in Canada
- the challenges facing remote northern communities in attaining NZE targets and their relationship to the traditional lifestyles
- housing design ideas and principles with respect to the proposed culturally-appropriate Six-Plex
- community resiliency and the impact NZE housing can have
- the importance of capacity-building and training to create a sustainable housing program
- the cost/benefit of an NZE program for the Cree Nation of Eastmain
- smart home technologies
- housing maintenance
- views of local builders on NZE building systems

After significant discussion, the CNE members adopted a Resolution supporting CNE's participation in the Smart Cities Challenge. (Annex O) This included the implementation of an NZE Housing Program and the construction of an NZE Six-Plex (Annex P). After the Resolution was adopted, community members were divided into four discussion groups where they provided more detailed input on the Smart City Challenge and the CNE NZE Housing Program.

Cree Cafes and Targeted Consultation

The ongoing use of the Cree Cafés during AGAs and community meetings has led to design innovations and gives residents a means to voice their ideas and share their experiences in respect of housing. It was through this process that the net-zero housing initiative was developed. Input was also sought from service providers in the health care and public safety sectors and, with the ideas of residents, informed the development of several culturally-appropriate housing designs that reflect on the Cree way of life.

Cree Café focus groups broke out during the Housing Forum to discuss questions related directly to the Cree Nation of Eastmain's development of the Smart Cities Challenge proposal. The discussions at the Cree Café confirmed strong support for a net-zero energy housing program, improvement of housing design, durability and operating cost. In particular, there was significant support for

- more design options for homes that will give residents greater opportunity to participate in housing design and that meet the needs of different members
- exploring pre-fab construction that would give the CNE more control over the quality of construction and lead to the creation of more local employment
- home monitoring to help protect homes against break-ins and equipment breakdowns when members are out on the land or travel down south.

The CNE recognized early on during the Smart Cities Challenge community engagement process, that engaging with local builders, to get their input and support, was essential to the success of the project. As part this process, an initial consultation session was

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

facilitated by design and technical consultant, William Semple, and net-zero energy consultant, Peter Amerongen, in October 2018. The presentation made to local builders during this consultation session provided information on house designs, the proposed building system, costing, capacity-building issues and the targets for the project. Local builder consultation sessions were used to gather feedback and initial impressions of the NZE program and the challenges and opportunities it would present.

Builders' Forum

Building on the first local builder consultations, an Eastmain Builders' Forum was held in December 2018. The Forum brought together local builders and tradespeople, housing inspectors and representatives from the construction materials supply chain with a view to ensuring the comprehensive representation of the building industry on the NZE program. The CNE took the opportunity to affirm the importance of the participation of local builders and suppliers to the success of the NZE program. More particularly, they were informed that a collaborative and cooperative approach must be taken if the NZE program is to address the ongoing issues with residential construction costs in Eastmain. This further reflected the CNE view that success and sustainability of its NZE program required a holistic approach and the buy-in of all stakeholders.

The Builders' Forum included an overview of the Smart Cities Challenge and the Cree Nation of Eastmain's proposal to establish a net-zero energy housing program to respond to its housing shortage. Participants were presented with the house designs and the proposed building system and technologies.

Builders and industry representatives in attendance expressed strong support for the NZE program and its goals of constructing more, better-built and resilient housing, creating employment and economic development opportunities and building housing industry capacity in Eastmain.

Eastmain Partners Meeting – Concordia University

In January 2019, the CNE and its partners and interested government agencies participated in a two-day meeting and planning session at Concordia University. In attendance were potential funding agencies, research partners and the CNE Smart Cities Challenge team. Presentations included

- CMHC northern housing research projects
- NRC northern research projects
- McGill University social northern housing research in Nunavik
- Concordia University Centre for Zero Energy Building Studies research projects and the NSERC research network

The session also

- developed linkages between the social and technical researchers and research projects

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- provided an overview on the Eastmain Smart Cities Challenge proposal and long-term objectives of the community
- provided an opportunity to contribute to the development of the research objectives of the research partners and input into the development of the final proposal

Community Engagement Plan – Project Implementation

As part of its ongoing consultation process with its members and to support the Smart Cities Challenge initiative, the CNE will carry out ongoing consultation with members and other stakeholders. In addition, the CNE will share NZE program progress and outcomes, and continue to obtain feedback from residents on the NZE program, including the important cultural aspects addressed in the design of the houses. The Cree Nation of Eastmain, in partnership with its research partners, will launch initiatives to gauge the impressions of residents living in NZE houses, with respect to their designs, and the roll out of the construction of NZE housing in the community.

To ensure that Indigenous values, traditions and experiences guide the research, the research project will be conducted according to the principles of Indigenous Research Methodologies (IRM), using research methods for community-based participatory research (CBPR) to engage with Eastmain residents. Using the participatory research model, the McGill University research team will work in collaboration with the CNE. The partners will contribute to the various phases of the research, especially in defining the research questions and objectives, developing the methodologies, data collection and analytical processes, and disseminating the research results. Participatory research will include validation steps at every stage of the NZE program.

For this research to be culturally-sound and grounded in Cree lived-experience, it will engage with Cree worldviews, knowledge and idioms, with a focus on the central role that relationships play in Cree culture. The McGill University research team will conduct one-day workshops with groups of 6 to 12 participants, ensuring representative demographic groups that include women, men, elders and youth. Following the IRM principles, talking circles will be used as a culturally-appropriate way to exchange ideas and bring together varied perspectives on complex subjects. Talking circles will allow the McGill University research team to obtain a comprehensive understanding of the Cree perspective of relationships and how these are impacted by housing conditions and design, and how these housing conditions and designs impact individual, family and community health and well-being.

The IRM principles will guide the research aspect of the NZE program, and data collection methods will be carried out in collaboration with the CNE. The research project will document

- housing conditions and well-being of individuals, families and of the community at "baseline"; i.e. before the implementation of the NZE housing program
- the change in housing conditions, after the implementation of the NZE housing program (i.e. impact assessment of the NZE housing program)
- the impacts on occupants arising from the change in tenancy and occupancy of a new NZE home or NZE retrofitted unit

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- culturally-appropriate and NZE design vs. housing presently available
- NZE retrofitting houses vs. moving into a newly-built house, vs. moving into an existing house in the community made available when other residents move into private homeownership houses

Eastmain Community Housing Meeting (May 2019)

Once the winners of the Smart Cities Challenge is announced and prior to launching the NZE housing program, the CNE will hold a special community meeting and information session. The meeting will provide information on the proposed roll-out of the NZE program including

- a detailed overview of the Cree Nation of Eastmain's final proposal for the Smart Cities Challenge
- the final designs of the houses to be constructed under the NZE program
- a detailed overview of the NZE construction projects to be carried out in 2019
- the proposal respecting the establishment of a warehouse/building component assembly facility
- the project management plan and the proposed timelines for the NZE program

Eastmain Annual General Assembly (August 2019)

At its 2019 AGA, the CNE will provide an update on the results of the Smart Cities Challenge and the roll-out of NZE housing program. A presentation of final drawings and 3-D models of the Accessible House being constructed at the time of the meeting, and the Six-Plex to be constructed in 2020. The information on these construction projects will include (a) the building system, (b) the plans for local assembly of building components, and (c) the net-zero energy monitoring of the projects. The AGA will serve to collect members' feedback on

- proposed project roll-out and construction timelines
- capacity-building and training components and their impacts on local employment
- proposed project monitoring and data collection

Builders Meeting/Workshop (Autumn 2019)

A one-day interactive workshop will be held late in Autumn 2019, after the completion of the Accessible House. The session will include those builders and tradespeople that worked on the Accessible House project. The workshop will consider and make recommendations on

- building system costs, ease of construction, changes or alterations
- pre-assembly of the wall system
- integration of the trades into the production of the house
- evaluation of the material ordering/storage

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- capacity-building and training

Eastmain Community Housing Forum (Autumn 2020)

A one-day Housing Forum will be held in Autumn 2020, after construction has commenced on the first Six-Plex project. The Forum will allow the CNE to get members' impressions on the design of the NZE houses, share results of year-1 monitoring and inform them of the progress of the warehousing and building component assembly facility.

The extensive community engagement initiatives that the CNE has taken on with the NZE program are reflective of the community's ongoing commitment to engage and consult with its residents on important community issues like housing. While the CNE's aspiration to combine the construction of multi-unit homes with NZE performance, culturally-appropriate designs and features is unique and ambitious, the CNE believes the project is achievable – and that extensive community involvement in the project is an important component in ensuring its success.

CHAPTER 7: DATA AND PRIVACY

Preliminary Privacy Impact Assessment

The CNE prepared a Preliminary Privacy Impact Assessment (PIA) showing the consideration it gave to the collection, use and flow of information (See Annex Q). The PIA was sent to the Office of the Privacy Commissioner of Canada for comments. These comments[8] have been considered in the elaboration of the Cree Nation of Eastmain's activities that touch data protection and privacy.

Compliance of Data Management Plan with PIPEDA

Privacy and the NZE Program

The NZE housing program will involve the collection, use and retention of personal information, of varying degrees of sensitivity. The information collected includes *inter alia* the below information (Table 19)

[8] The comments are attached together with Annex R.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 19 – Information Collection and Purposes

Information	Purpose
Name	Identification
Family Size	Allocation of appropriate housing
Address	Identification
Total household income	Determine rent
Health conditions (*if any*)	Determine special housing needs
Rental arrears	Determine eligibility for new housing and/or subsidies
Loan information	Confirm ability to pay and eligibility under Private Homeownership Program
Credit rating	Verify capacity to pay rent

In collecting this information, the CNE intends to comply with fair information principles.

Pursuant to the *Agreement on Cree Nation Governance Between the Crees of Eeyou Istchee and the Government of Canada* and the *Constitution of the Cree Nation of Eeyou Istchee*, the CNE must establish access to information procedures with respect to information in its control. The CNE is implementing a process for classifying information and establishing the level of protection required.

Presently, CNE agreements with suppliers, contractors and consultants contain provisions respecting confidentiality and, with respect to service providers, retention and disclosure restrictions.

With respect to the NZE housing program, both Concordia University and McGill University[9] are subject to their own privacy policies and to the Quebec *Act respecting access to documents held by public bodies and the protection of personal information,* CQLR ch A-2.1. Concordia University's Office of Research will provide guidance to the CNE to ensure research conducted under our NZE program complies with all applicable legislation and policies. A Summary Protocol Form will be submitted to the Concordia University Human Research Ethics Committee (UHREC) to obtain a Certificate of Ethical Acceptability before undertaking any monitoring of any occupied houses. Annual progress reports will be submitted to UHREC to obtain approval of the research privacy and data protection protocols throughout the monitoring phase.

A consent form that contains a plain language description of the project and any possible privacy risks will be given to occupants as part of the consent process.

Methods of Data Collection, Analysis and Storage

The CNE has held public meetings with its members to design the NZE housing program. As well, housing continues to be tabled at public meetings. Members are informed regularly of the information requirements for housing in general, which includes much of the information set out in Table 19.

[9] McGill University is subject to the Tri-Council policy Tri council policy statement http://www.pre.ethics.gc.ca/eng/policy-politique/initiatives/tcps2-eptc2/chapter9-chapitre9/

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

New regional policies will be coming into force and the NZE housing program will involve further consultation with members to ensure comprehension of the additional information requirements of the regional policies. The CNE will also inform members of the type of information that will be required and the purpose of collection of information under the NZE program. Prior to the collection of information, the individual is informed of the reasons for which the information is collected, how it will be used and whether it will be shared with other organizations.

Table 20 – Non-personal Information Collection and Purposes under NZE Program Monitoring

Information	Purpose
House Model/Size	Research
Energy use	Research
Air quality	Research
Comfort	Research
Satisfaction	Research

Collection

The CNE Housing Administrator will collect only that information required for the purposes of administering the NZE housing program and complying with the CNE housing policies and the policies to be adopted by the Cree Nation Government. More specifically, the CNE must, in order to administer its NZE program, be able to identify the occupants, verify their eligibility under the programs and capacity to pay and understand the health conditions, if any, that may be determinative on the type of housing unit allocated to the occupants.

The information collected by Concordia University and McGill University is necessary to enable the analysis of the net-zero energy technologies, construction systems and to measure the success and individual satisfaction with the NZE homes to be built in Eastmain.

Use, Disclosure and Retention

The information collected by the CNE will be used exclusively for the purposes of administering its housing program; i.e. allocating housing units, fixing the rent to be paid and establishing maintenance schedules, amongst others. Information collected by Concordia University and McGill University will be used solely for research purposes.

The information collected by the CNE will not be disclosed to third parties except as required by policy. Disclosure to the Cree Nation Government may be required under CNG policies and funding arrangements with the CNE, so that the occupant or the CNE can access subsidies for housing. Otherwise, the CNE will not disclose information collected from members for the administration of its program to third parties.

The CNE will however collect information generated by the sensors and data loggers. This information will be anonymized and then transmitted to Concordia University for the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

purposes of monitoring the performance of the NZE houses. McGill University will be responsible for collecting information directly from occupants of NZE houses and Eastmain residents with respect to the qualitative study it will conduct.

The information collected under this study will not be disclosed to third parties, including Cree Nation of Eastmain, until it has been anonymized.

Depending on the housing program, and the type of information collected, information collected for the purposes of administering the housing program is held for the duration of the housing project (i.e. until final payment) or until it is no longer relevant (such as a change of occupant).

McGill University may retain information for up to 20 years under its policies. This information though will be in an anonymized format.

Security and Privacy Considerations

The CNE is implementing information and data management protocols to ensure that personal and confidential information are properly collected, managed and stored. Given the feedback from the Office of the Privacy Commissioner, the CNE will require partners to enter into agreements that provide for the protection of personal and non-personal confidential information.

Adherence to Fair Information Principles

Governance

The CNE is committed to ensuring that personal and confidential information collected under its NZE program is treated in compliance with the *Personal Information Protection and Electronic Documents Act*. The CNE is implementing an Integrated Management System auditable to ISO Standards; 9001:2015 Quality Management; 20000-1:2011 Information Technology Service Management; and 27001:2013 Information Security Management.

It is also noteworthy that developing a privacy and data protection policy is a priority of the CNE. Recognizing the vast amounts of personal, employee, business and confidential information it handles regularly, the CNE plans to ensure that information is properly classified. Classification of the information it collects, uses and processes will ensure that, through policies, the CNE can establish the appropriate protection of that information and define access and disclosure restrictions.

Ownership and Control

Personal information required under its housing program will be owned and controlled by the CNE. In fact, where third party services are required to process the information, the CNE standard contracts contain clauses ensuring that any information obtained or processed by the third party remains the property of the CNE. More importantly, the information cannot be accessed directly by the third party on the CNE information system

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

without first obtaining the necessary authorizations. The authorization is given in the form of a letter that must set out the purpose of the access and the period of access.

In the NZE program, the CNE will also retain ownership and control of the data generated by the sensors and data loggers installed in NZE homes for monitoring purposes.

Consent

The CNE collects and holds information relating to members under other programs, including member benefits and elections. However, there is no information sharing between departments and programs unless the member expressly consents to disclosure of this information.

The name and address of occupants as well as information relating to membership are generally publicly known given the size of Eastmain. While the CNE may have a general understanding of certain health conditions, this information must be obtained directly from the individual or, if incapable, from that individual's caregiver with express consent.

Under the NZE program, CNE will only collect information from occupants of NZE houses or NZE retrofits, as required by the regional and CNE housing policies. This involves collecting personally-identifying information and information relating to occupants' financial situation directly from occupants. Prior to collecting this information, the CNE will ask occupants to consent to the collection of their personal information, using a consent form developed for the Housing Department needs. Pursuant to CNE practices, occupants must also consent specifically to the further sharing of information.

Occupants of NZE houses and NZE retrofits will also be asked to consent, on a voluntary basis, to the collection of information generated by the sensors and data loggers installed in the NZE houses and retrofits and will be told the purpose of such collection. Consent must be given in writing and will be related solely to the research conducted by Concordia University. The information will include addresses and other personally-identifying information collected by the CNE.

Concordia University will also request the consent of occupants participating in the NZE program monitoring. The consent form will explain in plain language that consent is given on a voluntary basis, with the option to withdraw at any time.

McGill University will collect information through one-on-one interviews, surveys and questionnaires. Occupants of NZE houses will be given a questionnaire each year. All collection and use of the data obtained through these methodologies will be subject to the consent of the occupant and McGill University must pass all research by the Ethics Committee to ensure that it conforms to McGill University's policy on protection and retention of personal information[10].

[10] *Ibid.*

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Data Minimization and De-identification

Information relating to energy use and production is non-personal information generated by the sensors and data loggers installed in NZE homes and retrofits and will be collected by the CNE Housing Department. The information will include the addresses of the homes, but this information will be removed before transmission of the non-personal energy use information. The CNE will anonymize all information before it is transmitted to Concordia University for the purposes of its study.

Access

Because personal information is collected for the purposes of administering the NZE housing program, it is important that it be accurate and up-to-date. Under CNE policies personal financial information must be updated every two years to ensure its accuracy. Individuals may also periodically update or modify their information by making a request to the Housing Department.

Under the *Constitution of the Cree Nation of Eeyou Istchee*, the CNE must set up a process to respond to access to information requests. This will include identifying the person who will respond to such requests. Presently, members attend the CNE administration offices to request access to information and documents held by the CNE.

Individuals may access information pertaining to them to ensure its accuracy and make corrections. Generally, this is done directly with the department holding the information.

Security

The information held by the Housing Department is kept in locked cabinets and password-protected computers to ensure information is adequately protected and can only be accessed by those administering the housing programs.

The CNE is sensitive to the need to protect the privacy of residents. By classifying information and setting access rights accordingly, it will restrict access to personal information it receives from occupants under its housing programs.

All information collected by McGill University will be anonymized. The names of study participants will be kept in separate password-protected files. Each participant will be attributed a number to prevent their identification. McGill University is alive to the risk that some participants will be readily identifiable solely on the basis of their comments or responses and will look for ways to mitigate. All information is kept in a password-protected computer in a research lab that can only be accessed with a code.

The NZE houses will be equipped with connective technology allowing Concordia University to monitor and measure field data and performance data. The data generated through the monitoring equipment will be sent by the CNE to Concordia University using Secure Socket Layer (SSL). This will ensure an encrypted link is maintained between the web server and browser and prevent cybersecurity breaches that would put the data at risk of unauthorized access or unintentional disclosure.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Open Data Strategies

The CNE has embraced an open, transparent data strategy aimed at ensuring ongoing communications with Eastmain residents on the NZE program. The level of consultation and community engagement has been extremely high and will continue under the NZE program.

Open data strategies will ensure that Eastmain residents have access to the results of the studies being conducted by Concordia University and McGill University.

Through smart technologies installed in NZE houses, occupants will have access to information relating to their energy use and production, energy use patterns and indoor air quality of their houses. These technologies are commercially available which means that they are easily transferable and reproducible in other projects and communities.

Risks

Table 21 – Risk Analysis

Risks	Preventive Measures	Corrective Measures
Accidental/intentional disclosure of personal information	Keep hard copy information in a secure, locked location Password protect computers and computer files	Inform occupants of breach Impose secure storage and password protection protocols
Identification of occupant from responses to McGill questionnaire	Phrase responses to avoid identification Explain to respondents the risk of identification	Remove response from published study
Accidental/intentional disclosure of health information	Keep hard copy information in a secure, locked location Password protect computers and computer files	Inform occupants of breach Impose secure storage and password protection protocols
Accidental/intentional disclosure of financial information	Keep hard copy information in a secure, locked location Password protect computers and computer files	Inform occupants of breach Impose secure storage and password protection protocols
Decision-making based on out-dated or inaccurate information	Ensure information is updated regularly Ask occupants to provide updated information	Correct information

CHAPTER 8: FINANCIALS

The CNE has extensive experience in managing capital projects, from securing funding and managing costs, to completion of various multi-million-dollar projects undertaken over the last ten years. Projects included construction of public facilities, infrastructure and housing. CNE benefits from some of the most up-to-date technologies to manage its projects including GIS, Accounting and Cost Control Systems, Preventive Maintenance, Project Management and Document Management Systems, that are linked together to improve efficiency. Our IT systems will soon be updated to a hyper-converged infrastructure that permits multiple servers to act as one which improves scalability, data protection, management, maintenance and operational activities.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

As a Cree local government, the CNE is required to follow the Canadian public sector accounting standards prescribed for governments as recommended by the Public Sector Accounting Board of the CPA Canada with exceptions of certain requirements as agreed by Canada and as detailed in our annual Independent Auditors Report. CNE management is responsible for the integrity and objectivity of financial statements and for implementing and maintaining a system of internal controls to provide reasonable assurance that reliable financial information is produced. CNE's Council is responsible for ensuring that management fulfills its responsibilities for financial reporting and internal controls and is ultimately responsible for reviewing and approving the financial statements.

Local companies in Eastmain, working with external skilled tradespeople for plumbing, electrical, heating and ventilation, will be constructing and retrofitting the NZE units. The CNE will be responsible for securing all funding and issuing contracts to Stajune Construction for project management and cost control of the construction works on a fixed-cost basis throughout the program. The CNE will also be responsible for monitoring the overall NZE program, risk management, the purchasing and negotiating with suppliers for all construction materials and the control of inventory.

Project Budget

Funding for the CNE NZE program has been secured, with the exception of the Smart City Challenge winner's prize, and revenues generated from the sale and leasing of housing units. The CNE will continue to apply under any funding programs that can benefit the NZE program.

Revenues

Details of our secured and projected revenue sources are as follows

- **Cree Nation of Eastmain**
  The CNE will contribute up to $5M from its Local Economic Development Fund over a six-year period for the NZE program activities, matching the SSC prize if CNE is chosen as the winner
- **Infrastructure Fund**
  Funding comes from an annual subsidy provided to the CNE through the regional government for housing and infrastructure purposes
- **Housing Action Plan**
  These funds are received from the regional government for urgent mould remediation and housing renovations
- **Regular Program Subsidies**
  Grants from the regional government help off-set the high costs of construction in Eeyou Istchee
- **Smart City Challenge**
  The prize awarded to the winner of the Smart Cities Challenge $5M category

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- **Sales and Rent**
  The monies received from the sales of the NZE private homeownership houses and the monthly rent collected from tenants occupying rental housing units
- **Training and Development**
  Revenues secured by the CNE to date from outside sources that have programs designed to build capacity in Indigenous communities

Expenses

Expenses for our NZE program are costed in today's dollars and exclude possible year-to-year inflationary increases that would normally apply to construction labour and materials. The CNE believes that as it gains experience in net-zero building techniques, efficiencies will off-set annual inflation numbers. Also, costing for material was based on northern norms and excludes potential savings that may be generated by bulk ordering materials and establishing and improving CNE's supplier management processes and the relationships within the supply chain.

CNE NZE program projected expenses are

- **Accessible Housing Unit**
  Construction costs for building an Accessible House pilot unit in year-1 of the NZE program
- **Multi-Client Six Plex**
  Construction costs for building 5 Six-Plex buildings over a five-year period between year-2 and year-6 of the program
- **Detached Single Family Unit**
  Construction costs for building 4 single-family houses in year-2 through year-5 of the NZE program (this excludes the pilot Accessible House). Year-2 and year-4 will see a 2-bedroom Starter House built and a 3-bedroom Private Homeownership House will be built in year-3 and an Elders House built in year 5
- **NZE Retrofit**
  Expenses are related to carrying out a net-zero retrofit pilot in year-1 and retrofitting 4 units in year-2, and 5 retrofits each year for years 3 to 6
- **Training and Development**
  These expenses represent the estimated costs for training and work experience programs for construction workers in relation to net-zero building and potential CNE contributions to qualify community members in the skilled trades of plumbing, electrical, heating and ventilation
- **Program Administration**
  These expenses are related to CNE project oversight and personnel required to ensure overall success through continuous program marketing, operational support by technical experts, professionals and applying for additional resources to extend projects beyond the Smart Cities Challenge
- **Solar Technologies**
  The Cost "B" estimate for the Accessible House, based on the energy modeling exercise used to determine the size of the photovoltaic array needed to produce

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

the electricity requirements to reach net-zero status. This number was used to determine the average number of photovoltaic panels per unit being built and retrofitted per year.

SMART CITY CHALLENGE----Net Zero Energy Housing Program

Figure 7. Proforma Financial Statements

The proforma financial statements does not reflect the bulk ordering of all construction material (excluding electrical, plumbing, heating and ventilation) which will be purchased by Stajune Construction in the Fall of year-1, for construction projects to be carried on in year 2 and every subsequent year.

Figure 8. Quarterly Expenses per Year.

CASH OUT SPLIT BY QUARTER AND YEAR

Year/Quarter	Q1	Q2	Q3	Q4	Total expenses per year	Other Expenses maintenance:	Total Cash Out per year
2020			$ 617,075.00	$ 262,783.00	$ 879,858.00		$ 879,858.00
2021	$ 537,214.50	$ 537,214.50	$ 1,247,790.50	$ 1,167,344.50	$ 3,489,564.00		$ 3,489,564.00
2022	$ 537,214.50	$ 537,214.50	$ 1,354,546.00	$ 1,281,127.00	$ 3,710,102.00		$ 3,710,102.00
2023	$ 537,214.50	$ 537,214.50	$ 1,316,573.00	$ 1,281,127.00	$ 3,672,129.00		$ 3,672,129.00
2024	$ 537,214.50	$ 537,214.50	$ 1,294,086.00	$ 1,281,127.00	$ 3,649,642.00		$ 3,649,642.00
2025	$ 537,214.50	$ 537,214.50	$ 981,127.00	$ 1,256,127.00	$ 3,311,683.00		$ 3,311,683.00

Class B Methods and Assumptions

As the CNE NZE program is primarily comprised of capital projects relating to construction, the below Figure 9 was used as the basis for construction Class "A" through "D" estimates.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Figure 9. Construction Class Estimates

Class of estimate	Design Estimate Effort	Project Contingency Range (%)		Cost estimate basis	
				Materials	Labor
		(-)	(+)		
A	Finalized (100% complete tender documents)	5%	10%	As for Class B, with material on approx. 100% firm basis	As for Class B, some actual field labor productivity may be available
B	Detailed (66%Design development)	10%	15%	Firm unit cost quotes based on detailed quantity take-off	Estimated man-hour units (including assessment) using expected labor rate for each job classification
C	Preliminary (33%Design development)	15%	20%	Labor/material ratios for similar work, adjusted for site conditions and using expected labor rates	
D	Concept (simplified)	20%	30%	By overall project or by ratio to area or global project unit and comparison with similar work with materials adjusted to current cost indices and labor adjusted to site conditions.	

Estimates were realized by an Indigenous engineering firm involved in Indigenous construction projects and are specialised in construction project management. These estimates were based on completed preliminary design drawings, including definition of major systems and subsystems and outline specifications. These documents were prepared by an Architectural Technician under supervision of the Designer and a net-zero builder. The estimates include documented work breakdown and quantities calculations. Rough material prices used for the estimates were provided by a regional supplier. Mechanical equipment and other material prices were based on budget bids obtained from various suppliers. Realistic assumptions were made on labour productivity. Labour rates were based on rates established by the Commission de la construction du Québec and the estimated ratios of local and external tradespeople. Finally, estimates were cross-checked by using a unit price method based on similar project experiences.

Contributions from other Sources

The CNE NZE program will leverage revenues generated as set out above, other contributions and the Smart Cities prize money to amplify the impact and reach of our program by

- applying for additional provincial and federal funding geared toward enhancing accessibility for persons with disabilities
- obtaining in-kind contributions and/or financial assistance from our partners and government programs including
  - ❖ the Concordia University Centre for Net-Zero Energy Building Studies in-kind and financial contributions through funding received from (NSERC) that supports its net zero research projects and initiatives

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

- McGill University research carried out under a research grant funded by CMHC under its Research Planning Fund (RPF) (See Annex – Letter of Approval)
- Cree Human Resources Development is subsidizing the salaries of three local youth to assist CNE with project coordination and proposal development
- CMHC is contributing funding under a youth work experience program in relation to research and team environment initiatives via a grant through the Housing Internship Initiative for First Nation and Inuit Youth program (HIIFNIY)(See Annex *)

The CNE's project management team will continually apply to funding programs and other revenue sources to leverage success. This includes any local, regional and national programs that support Indigenous and accessible housing, green technologies, capacity building, smart technologies and research that captures net-zero development and the human experience related to our project to ensure sustainability beyond the Smart Cities Challenge.

With that said, this Smart Cities Challenge has already yielded success for the CNE. The CNE approached housing holistically from a 360-perspective for the comprehensive engagement of all stakeholders including community members, academia, industry experts and the supply chain. By undertaking this approach with a more fulsome consultation of the supply chain and industry stakeholders, the CNE was able find significant savings compared to the way business was normally done. In fact, detailed costing of the CNE prototypes was initially estimated at $3M for the Six-Plex however the Class B estimates for the Six-Plex came in under $2M resulting in greater affordability per unit. This cost savings also applies to all other new units built under our program.

Financial Tools and Methodologies

Fund accounting is the financial methodology used by the CNE that results in a self-balancing set of accounts for each fund established by legal, contractual or voluntary actions. Transactions are accounted for under five different funds established by laws. The accounting software, Sage 300, as well as Committed Cost systems are used for the financial operations. Those systems enable the CNE to account for expenses by department at the General Ledger level. The departments represent projects for the Special Projects Fund, the same applies to the General Operation Fund and the Capital Additions Fund.

Committed Cost systems enable the issuance of purchase orders related to specific projects taking into consideration the available budget per account and fiscal period. This information is transferred into Sage 300 in order to provide reporting per project including actual costs, budgets as well as commitments. The financial plan for our NZE program is based on budgeted cash flows on an accrual basis.

Project management implementation will use MS Project along with the principles outlined by the Project Management Institute (PMI) for project management and with cost

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

accounting methodologies managed through Sage 300. The CNE will further ensure proper project management by implementing all aspects of our ISO/IMS.

Risk Identification and Mitigation

Below are the risks identified by the CNE with respect to the financial operations of its NZE program.

Table 22 - Risk Analysis

Risks	Preventive Measures	Corrective Measures
Cost overruns	▪ Implement contractor/supplier management best practices ▪ Hire an experienced construction project manager and site supervisor ▪ Conduct audit on all construction and project management processes	▪ Adjust project scope and budgets ▪ Identify root cause and implement audit findings to improve efficiency
Unable to sell units as individuals can't qualify for a mortgage	Pre-screen and pre-qualify parties	▪ Identify additional purchasers ▪ Re-classify a 'for sale' unit as a conditional rent to own until the potential purchaser can qualify for a mortgage
Construction company unable to secure necessary resources for construction	Assist companies in securing capital funds on a project by project basis	▪ Foster partnerships and joint ventures between companies to improve their financial capacity ▪ Directly manage the project through Eastmain's development corporation ▪ Increase CNE's investment into the project
Cost of constructing net zero homes is too expensive in Eastmain	▪ Scale project to "net-zero ready" energy performance ▪ Identify and secure federal and/or provincial green energy subsidies to offset the cost of the alternative energy systems (e.g. solar) ▪ Redesign units to accommodate a smaller living space	▪ CNE develops an in-house green energy subsidy program ▪ Re-evaluate and redesign the construction system ▪ Build smaller units ▪ Enter into agreements with companies that result in lower profit margins in exchange for project guarantees
Insufficient rent collection on rental units to help support operation and maintenance and reinvestment into future construction	▪ Pre-qualifying renters by verifying their credit history ▪ Request rental deposits ▪ Verify capacity to pay ▪ Credit bureau reporting ▪ Ensure rental agreements are fair and drafted to look after the best interests of both parties while protecting the investment of the property owner	▪ Terminate occupant's rental agreement as a result of failing to pay and evict the tenant ▪ Amend rental agreement to require a co-signer whom would also be liable for any rental arrears ▪ Institute penalties through forfeiture of local subsidies and automatically apply grant to rental arrears ▪ Suspend eligibility for local grants, loans and subsidies to persons with rental arrears ▪ Take legal action
Negotiations with the supply chain are not successful in reducing the current cost of materials	▪ Pre-discussions with suppliers with regards to what we are trying to achieve with the SCC to foster win-win relationships ▪ Expand the list of suppliers that are approached	Re-tender the ordering of materials

Finalist Grant Report

The CNE supplemented the finalist grant with funds from its operations and partners to help offset the costs associated with project coordination, proposal development and the activities needed to design and build its systems and costing. The finalist grant funding was used along with CNE funds to develop the final proposal. Detailed use of those resources are as follows:

- **Project Coordination**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Expenses for the assignment and reassignment of CNE personnel to coordinate all project activities through the project management team

- **Stakeholder Engagement**

  Sessions were regularly held throughout the project development phase to acquire technical information and clarify expectations and roles of all stakeholders while obtaining feedback from the community members and all other interested parties

- **Proposal Development**

  Costs related to CNE staff time as well as the effort put forth in organizing information and assistance by partners to draft the final proposal

- **Building Designs and Systems expenditures** (architecture, energy modelling, engineering)

  Refining the designs of each of the housing prototypes that were developed based on extensive consultation with community members and resulted from energy modelling exercises and consultation with net-zero and local builders and the housing materials and equipment supply chain

- **Data Modelling**

  These costs were for the data modelling exercises required to determine the building system and technologies required to meet net-zero targets as part of the design process

- **Plans, Specs and Costing**

  These were incurred in developing the working drawings, design of the HVAC system and solar systems, analysis and selection of accessible housing equipment, and selection of the household lighting and other equipment

- **Jury Meetings**

  The costs for travel, lodging and per diem relating to meeting with the SCC Jury in Toronto to represent CNE's project and answer questions posed by the Jury.

Our project had a minor deviation regarding the original application. We decided to extend the project from five years to six years in order that year-1 could serve as a pilot year to ensure detailed costing is obtained through extensive project oversight and to identify true costs versus billed costs. The pilot year will be used to account for actual costs of material and labour to ensure data is available to properly analyse actual costs within the environment. This information will give policy makers data that reflects the northern reality thus enabling them to make informed decisions.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Figure 10. Finalist Grant Financial Report

SMART CITIES CHALLENGE FINALIST GRANT

Project Revenues:

Smart Cities Challenge Finalist Grant	$ 250,000
Cree Nation of Eastmain	73,344
CMHC-HIIFNIY Fund	36,000
CHRD	27,563
Total Revenues	**$ 386,907**

Project Expenses:

Fiscal Year	**2018 - 2019**				**Total**
Financial periods	***Qrt 1***	***Qrt 2***	***Qtr 3***	***Qtr 4***	
Project Coordination	$ 1,500	$ 7,807	$ 12,194	$ 43,192	$ 64,693
Stakeholder Engagement Sessions:

Jury Meetings			13,796		13,796
Total Quarterly Expenses	**$ 33,683**	**$ 32,780**	**$ 114,231**	**$ 206,213**	**$ 386,907**

Other Details

Class B estimates were established for the pilot construction of the Accessible House (first single-family house) and for the Six-Plex. A Class "B" estimate for the Six-Plex was derived from the detailed section, plans and elevations of the Six-Plex, and the costing for construction details and mechanical systems of the Accessible House (as these are the same construction details that will be used in all the NZE houses). For all other aspects of our project, Class "D" estimates will be used until building systems have been finalized and lessons learned from the pilot projects are applied. Plans and specs for Class "A" estimates for the tendering of the Accessible House will require identifying the specific exterior and interior finishing materials (flooring, lighting, etc.) and household equipment for the house.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Table 23 – Detailed Costing of NZE Program

CHAPTER 9: IMPLEMENTATION PHASE

Duty to Consult with Indigenous groups

The CNE is an Indigenous group, having recognized and constitutionally-protected land rights in Eeyou Istchee, the territory where it will carry out its Net-Zero Housing Program. As such, the CNE is not subject to the duty to consult.

Figure 16. Treaties Map

Modern Treaty Obligations

The CNE is one of the signatories to the *James Bay and Northern Quebec Agreement*, Canada's first modern-day treaty. The CNE therefore does not have any obligations, in the context of its NZE program, under federal or provincial legislation with respect to Indigenous treaty rights.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Community Employment Benefit (CEB)

If selected as the $5M category winner of the Smart Cities Challenge, the CNE will report on the *Community Employment Benefit* for Indigenous people. Its NZE program is inclusive in that it offers employment and business opportunities to youth, women and apprentices for skilled trades. Tendering for work that will be carried out under the NZE program will prioritise small, local Indigenous business and tradespeople.

Already the CNE has hired 3 youth under a work placement program to gain experience with the project management team and McGill University. The CNE will engage other youth as part of the trades training initiative under the NZE program. We will also target employment for youth with disabilities.

Part of our project management team includes an Indigenous-owned and operated engineering firm. The CNE will support Indigenous businesses as part of our procurement process.

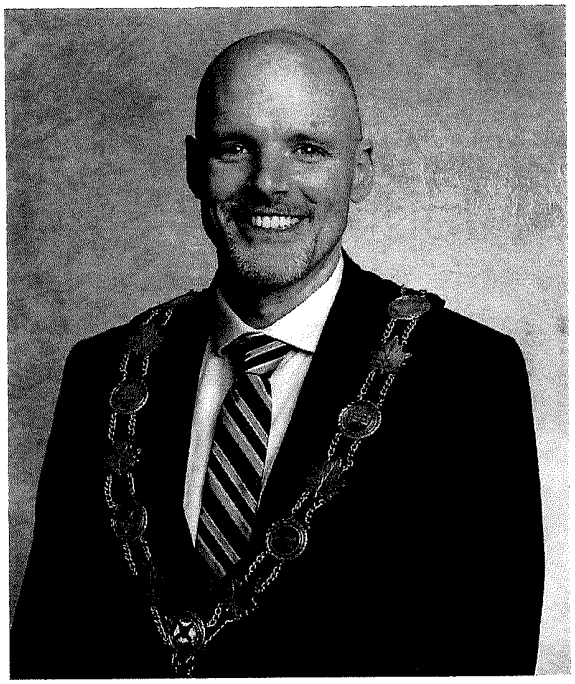
Climate Lens Assessment (CLA)

Climate Lens Assessment is not applicable to CNE's project due to it being within the $5M category.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

ENERGY POVERTY REDUCTION PROGRAM

Final Application to the Smart Cities Challenge $5M Prize Category



SMART CITIES CHALLENGE

ENERGIZE BRIDGEWATER

town of BRIDGEWATER

MESSAGE FROM THE MAYOR

Mayor David Mitchell

Our community will lift its residents out of energy poverty, starting by reducing the energy poverty rate by 20% by 2025.

As Mayor of the Town of Bridgewater, that is a challenge statement that makes me proud to serve my community. The fact is, Bridgewater is ready for a massive shift toward a smart energy economy by becoming a Smart Community. Through our Energize Bridgewater program, our community has demonstrated nationally-recognized leadership in understanding and planning a pathway toward a new kind of energy economy – one where energy services are universally available and affordable, clean and efficient, and protected from supply volatility and the coming ravages of climate change.

Through our proposed solutions, we will make sure that those among us who are most vulnerable, and least able to afford the transition, are the first ones we help across the threshold. Those residents have the most to lose, and through the betterment of their lives, our community has everything to gain.

The stories shared by our community partners and residents have made it clear that energy poverty is having a profound and debilitating impact here in Bridgewater. It systematically strips as many as 40% of our residents of their dignity and damages the physical and mental wellbeing of young and old alike.

Yet, the real, lasting, and practical solutions to this problem are so close at hand that we can already see them emerging. Through this Challenge, our town will design and prototype a new model of municipally-led accessible and affordable energy management services for our community's most vulnerable residents. Dramatic improvements to housing, transportation, and community services will be driven by a self-financing investment program and a coordinated access system, all powered by connected technologies.

We've been innovative. We've been bold. We've made change happen. However, nothing we've done to date has come close to achieving the impact of our proposed Energy Poverty Reduction Program. At the same time, everything we've done to date has prepared us to make this leap.

We need help in launching this bold idea. By selecting Bridgewater as the winner in the $5 million Smart Cities Challenge prize category, Canada will support a powerful new demonstration of technology-enabled community-based problem solving that addresses both the poverty crisis and the climate crisis at the same time. Bridgewater is ready to show Atlantic Canada, and the nation, how it can be done.

David Mitchell
Mayor, Town of Bridgewater

APPENDIX 107

EXECUTIVE SUMMARY

Our community will lift its residents out of energy poverty, starting by reducing the energy poverty rate by 20% by 2025.

Bridgewater's growing need for clean and reliable energy is limited by our ability to afford it. Our estimates show that the burden of energy poverty is carried by 38% of Bridgewater households that are unable to meet their basic energy and transportation needs. Many more are at risk of falling into this category as it's expected that energy prices will continue to trend upwards. Bridgewater is approaching this issue through systematic change at a household, neighbourhood, community, and regional level by, treating access to affordable and secure energy as a requirement for healthy living. To ensure residents can live free of the constant threat of energy poverty, our program uses energy management as a smart city approach for resident empowerment.

Bridgewater envisions an Energy Poverty Reduction Program that uses data and connected technology to bring together and drive energy savings to create financial returns for households and property owners. This system also provides coordinated access to community supports for households experiencing energy poverty. And finally, a financial system that supports extensive investment in energy efficiency solutions. Bridgewater's impactful, comprehensive approach to community-based problem solving and transformational change is highly transferrable to communities across the country that are struggling with energy poverty challenges of their own. Municipalities are uniquely positioned to be at the forefront the of shifting world of energy systems, pairing data and connected technologies for community services that ensure underserved populations are the first beneficiaries of the energy transition.

1. **Vision:** why this matters, and overview of services
2. **Performance Measurement:** detailed program descriptions, deliverables, and outcomes
3. **Governance:** accountability structure, and program partners
4. **Project Management:** team members and risk management
5. **Technology:** data platforms, connected technologies, and energy solutions
6. **Data and Privacy:** how information will be used, safeguarded, and shared
7. **Engagement:** community consultations up to now, and going forward
8. **Implementation Phase Requirements:** fulfilling national expectations
9. **Financial:** costs, revenues, innovative financing solutions, and how we used the Finalist Grant

TOWARD A FUTURE FREE OF ENERGY POVERTY

Bridgewater, like most communities across Canada, has a growing hunger for energy. Our energy needs are everywhere – cellular phones, warm showers, food refrigeration, heat during the frigid winters, lights, laundry, and computers. With our energy needs increasing, many households in Bridgewater are unable to afford the rising costs of this service and are having to make impossible decisions to balance monthly household budgets.

As a 'have not' province, Nova Scotia has struggled for decades with the issue of widespread poverty and low incomes. Given our region's and our community's overall economic challenges, energy insecurity adds a real and growing threat to our ability to meet our basic needs. When we asked our community partners to tell us how urgent energy poverty issues are in relation to other issues in Bridgewater, Family Service of Western Nova Scotia stated: "this may be the least talked about yet most significant and productive structural, community, and individual issue we could tackle." The challenge of energy poverty is daunting and overwhelming, yet the Town of Bridgewater is firmly convinced that it is possible to create a solution to both the poverty crisis and the climate crisis by using technology-enabled community-based problem solving.

Energy poverty isn't just lingo for Bridgewater – it is a real problem for real people. Our program team has spent considerable effort in defining this term to be meaningful to our residents, especially those who identify with its hardships. In our initial application, we **defined energy poverty using the indicator of a household spending 10% or more of its after-tax income on energy, with fuels and electricity for the home as well as transportation counting toward energy expenditures.** We maintain that this definition is accurate, but understand that energy poverty can also be so much more.

Bridgewater and its community further defines **energy poverty based on access to affordable and secure energy in their home, neighbourhood, community, and region. The greater the degree of insecurity or lack of access, the greater the risk that the household will experience energy poverty**[1] This shift in perspective lifts the burden of energy poverty mitigation from being focused solely on the individual household, toward including community and regional infrastructure and services.

With this new emphasis on risk for energy poverty, research was required to determine what exactly the risk factors are and how this affects Bridgewater's vulnerability. Table 1.1 describes the energy poverty risk factors identified by our community.

Systematic Levels of Energy Poverty Risk

Risk Level	Description
1. Household	Household-level risk factors include personal risk influences such as the energy efficiency of the home and transportation means as well as general poverty risk factors such as income, health, literacy, family supports, etc.
2. Neighbourhood	Neighbourhood-level risk factors include neighbourhood energy systems, walkable streets, transit service, etc., as well as the energy efficiency of multi-unit residential buildings (MURBs).
3. Community	Community-level risk factors include community-scale energy and transportation systems, the energy efficiency of the overall housing stock, community support services, social stigma, and whether the community has developed a coordinated response to the problem of energy poverty.
4. Broader Systems	Broader systems-level risk factors include the price of energy in the region; the availability of secure, affordable energy technologies; employment opportunities; economic diversity, etc. It also includes provincial and federal programs and policies that may remedy or exacerbate energy poverty.

Table 1.1

[1] This model of energy poverty aligns well with the Social Determinants of Health and other health risk and inequality models used by modern public health initiatives including Health Canada.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

As Bridgewater gained a greater understanding of energy poverty during the final application phase, the breadth of its impact on our community became startlingly clear. Early research indicated that as much as 40% of Bridgewater's population may be experiencing energy poverty in some form. A community census was undertaken to validate residents' lived experience with energy poverty. From that census, we can confirm that 38% of residents currently experience, or are highly at risk of, energy poverty. Add to that the recent Statistics Canada report that the number of Nova Scotian children in poverty has risen from 14% in 2016 to 17% in 2017[2] and it is very clear that the problem of poverty in our community is not going away and requires urgent and responsive action.

Bridgewater is a community driven to overcome our challenges through deep engagement and innovative projects. To demonstrate our sincerity in creating real and meaningful change, Bridgewater commits itself to the following Challenge Statement:

Our community will lift its residents out of energy poverty, starting by reducing the energy poverty rate by 20% by 2025.

Targeted Energy Poverty Reduction Rate by Program Year

Year	2020-21	2021-22	2022-23	2023-24	2024-25	2029-30 After 5 more years
Population *(projected)*	9,031	9,156	9,211	9,266	9,320	9,583
Households Experiencing Energy Poverty *(projected, based on current 38.5% energy poverty rate)*	1,659	1,682	1,692	1,702	1,712	1,760
Number of Households Helped *(Cumulative)*	0	50	125	225	350	1,100
Energy Poverty Rate Reduction *(Cumulative)*	0%	3%	7%	13%	20%	62%

Table 1.2

With a five-year implementation horizon for the Smart Cities Challenge, the community has designed a program that will reduce the energy poverty rate in Bridgewater by 20% by 2025, while maintaining the long-term goal from the original challenge statement to lift 20% of its residents out of energy poverty within 10 years. With a $5 million grant from Smart Cities Challenge, the Town is confident that change can be realized within a single generation. And with a revised start date of 2020, the Town is eager to begin this very important work.

Based on the current and projected future population of the community, our Challenge would mean lifting 350 households out of energy poverty by fiscal year 2024-25. The community would then be on track to cut its overall energy poverty rate in half by 2028, and by as much as 62% over a 10-year timeframe (by fiscal year 2029-30). Our anticipated progress is illustrated in Table 1.2.

The Town of Bridgewater envisions a future for our community where energy poverty reduction strategies work in tandem with clean and efficient energy systems to confront energy poverty at its core – the very source of the energy itself. With assistance from the Smart Cities Challenge, we will overcome existing barriers to achieve our community vision:

[2] Statistics Canada, accessed on February 28, 2019 https://www150.statcan.gc.ca/t1/tbl1/en/cv.action?pid=1110013501

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

By 2050, Bridgewater's green, self-supportive economy will be securely powered by clean and efficient energy systems. The community's conscious investments into energy infrastructure, equipment, training, and education will make energy affordable and accessible for all members of the community, and contribute to our town's prosperity and resilience in the face of a changing climate and world.

- Bridgewater's Energy Shift vision, Community Energy Investment Plan (2018)

Our commitment to this project will empower our community to take a leadership role in combating energy poverty, which is a daily threat to our sustained health and economic viability. The energy poverty solution is our most ambitious vision to date and we can't wait to show the rest of Canada that even small towns like Bridgewater can lead a change of this magnitude.

ENERGY MANAGEMENT AS A SMART CITY APPROACH

Households experiencing energy poverty know first-hand the critical importance of managing their energy consumption and therefore their expenses. The stories we have collected from the community have been truly stunning in this regard: we have documented families turning off their heat for days at a time in the middle of winter to be able to afford their next power bill, or going without light and powered devices at the expense of their health and wellbeing. From an energy management perspective, this has informed us that Bridgewater residents who experience energy poverty often already have well-practiced skills in energy management. What they tend to lack is energy efficient home heating systems and other infrastructure to work with, and adequate control over their home and transportation options.

I reduced my power bill from $120 to $60 by unplugging everything when I am not using it. I don't really use lights, only when company is over. I use my phone as a flashlight. – RESIDENT, TOWN OF BRIDGEWATER

Bridgewater's Energy Poverty Reduction Program is well matched to a smart cities approach, as it aims to restore control to our residents over their energy costs and infrastructure by leveraging the fundamental benefits that data and connected technology have to offer. Throughout this application we will reinforce how a small town can be a smart city by showcasing:

- how data can be used to create open and strong communities inclusive of the most vulnerable members and how access barriers to this data can be overcome (**See Data and Privacy chapter**);
- how data and connected technology can be a uniting force to bring together the municipality, other levels of government, government organizations, and private enterprise (See **Technology chapter**);
- how the innovation of one community can be transferable to our neighbours across the nation (see **Performance Measurement** and **Project Management chapters**);
- how connected technology enables collaboration between service providers and industry for the betterment of society (See **Governance chapter** and **Data and Privacy chapter**).

Through the program, the Town of Bridgewater will provide advanced new **energy management support services** to 2 primary clients:

1. Bridgewater households who are highly at risk of energy poverty, currently estimated at 38% of Bridgewater's population.
2. Bridgewater property owners whose properties are inhabited by households-at-risk of energy poverty. Housing energy efficiency is a key risk factor in determining whether or not a household will experience energy poverty. Groups of property owners can be clustered together to receive neighbourhood-scale energy services and solutions.

In situations where the households-at-risk own the homes they live in, the two clients are one and the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

same. For a large number of households-at-risk, however, home ownership is not affordable, and rental housing is their only option. In this case, the property owner is the household's landlord. In Bridgewater, 43% of residents rent their home (Statistics Canada, 2016). We anticipate that the majority of property owners in the programwill be landlords.

As we explain in the rest of this application, the Energy Poverty Reduction Program builds on existing municipal service competencies, data systems, and infrastructure. As such, this service concept is widely replicable and transferrable to other communities where municipalities already play a critical role in community service provision.

For those experiencing energy poverty, access to the technology and data to manage their energy needs is often very limited. For the most vulnerable, interfacing with a human rather than a dashboard is the most practical way to assist with assessing their needs and solving the immediate problems caused by energy poverty. Not having or being at risk of losing their shelter, these residents will need access to a range of community, health, employment, and other services, not just services that relate to housing and transportation.

The program will establish navigators for the different system components of the Energy Poverty Reduction Program. These navigators will be human interfaces for households-at-risk, connecting them with the services they need, including the energy management services offered by the Town of Bridgewater. Coordinated Access Systems are widely replicable and transferrable to other communities. Additional information is provided in the following chapters.

INNOVATION AT THE CORE

The design of the Energy Poverty Reduction Program combines 3 innovative mechanisms to reduce risk of energy poverty:

1. Connected technologies: forming the backbone of the service concept, connected technologies provide a technological 'engine' that drives energy savings to create financial returns for the households and property owners, and streamlines client intake and access to community services.
2. Coordinated access: a social support 'engine' that keeps clients connected to the program and coordinates access to the various additional community supports households-at-risk may need.
3. Financial investment: building on Bridgewater's experience developing a fully-costed approach to energy transition, self-financing energy improvements provide a financial 'engine' that supports extensive investment in energy efficiency solutions.

Community Working Group members view a presentation at a Smart Cities Challenge workshop.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

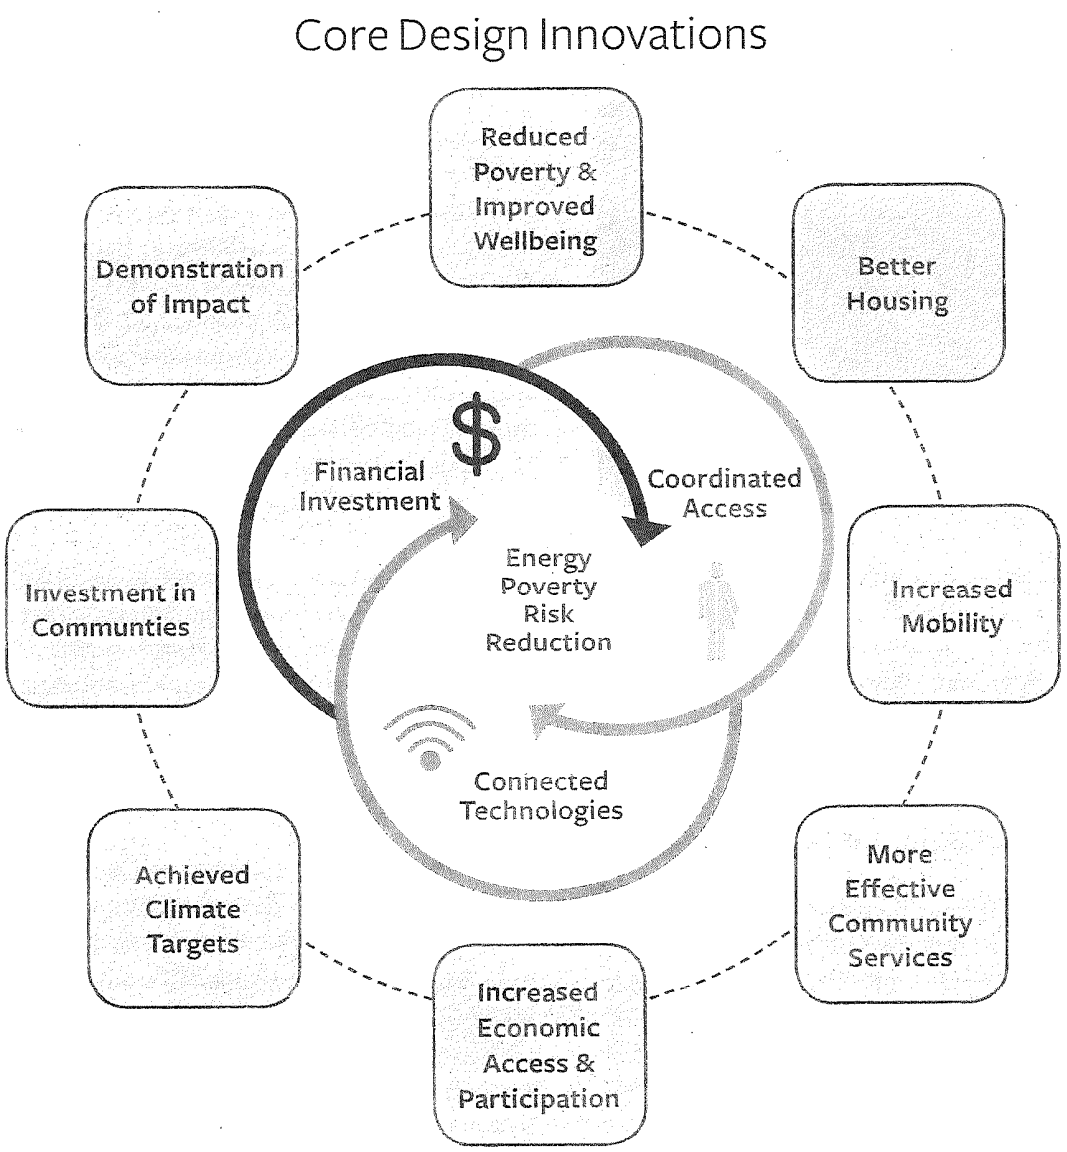

Diagram 1.1

These 3 innovations mutually enable and strengthen each other's outcomes. This synergy drives systematic and continuous improvements to housing, transportation, and community services, thereby reducing energy poverty risk and improving many dimensions of community life. These innovations and their anticipated outcomes are captured visually in Diagram 1.1.

A GREATER COMMUNITY IMPACT

Starting with our initial application, we have embarked on a deep and meaningful discussion with our community. From households-at-risk, to community service organizations, to landlords and energy utilities, the Town has listened to lived experiences in our community and developed a program that will positively impact a multitude of community needs. Consequently, our program outcomes have grown substantially. Table 1.3 summarizes the anticipated outcomes by category, and indicates their relationship to our initial application:

The expanded outcomes demonstrate a greater understanding and articulation of our Challenge to lift our residents out of energy poverty. Cumulatively, they reflect the community's urgent call for transformative change at all levels to achieve this goal. The outcomes are transferrable to other communities with very different local and regional contexts compared

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Anticipated Outcomes by Category

Outcome Category	Outcomes	Relation to Initial Application (April 2018)
Reduced Poverty & Improved Wellbeing	1. Reduce energy poverty rate	Challenge statement
	2. Reduce poverty	New
	3. Improve health of residents	Outcome 6
	4. Increase residents' quality of life	New
	5. Increase residents' sense of empowerment and inclusion	New
Better Housing	6. Increase energy security for residents	New
	7. Reduce and stabilize energy expenses for residents	Outcome 4
	8. Improve relationship between tenants and landlords	New
	9. Improve residential energy management practices	New
Increased Mobility	10. Improve residents' mobility	Outcome 3
More Effective Community Services	11. Improve residents' access to community services	New
	12. Improve community service delivery efficiency and effectiveness	Outcome 7
	13. Shift community service spending toward systemic solutions	Outcome 8
Increased Economic Access & Participation	14. Increase residents' income	Outcome 8
	15. Increase residents' participation in the green economy	Outcome 8
Achieved Climate Targets	16. Reduce greenhouse gas emissions	New
	17. Shift to efficient, clean, affordable, and secure energy	New
Investment in Communities	18. De-risk affordable energy investments in the community	New
	19. Successfully fund energy poverty reduction solution	New
Demonstration of Impact	20. Demonstrate feasibility and effectiveness of program	New
	21. Inspire structural energy poverty solutions at the Provincial and Federal levels	New
	22. Inspire other communities to adopt energy poverty reduction efforts	New

NOTE: No outcomes have been lost between the initial and final applications. Outcome indicators and targets are described in detail in the **Performance Measurement chapter.**

Table 1.3

to Bridgewater. While other communities may need to make modifications to the specific indicators used to measure progress based on locally available information, the outcomes are universally meaningful, measurable, monitorable and well-suited to a smart cities approach.

APPLICATION REFINEMENTS TO BETTER ACHIEVE OUTCOMES

In order to lift our residents out of energy poverty, the design of the Energy Poverty Reduction Program has undergone significant improvement and refinement. Whereas it was originally proposed as a set of 7 interlocking sub-programs, the updated program design has been simplified into a set of 5 connected services, designed with universal transferability and application to other communities in mind.

Program services are explained in the sections that follow:

Coordinated Access System

This service provides a single coordinated intake process for program participants, with a special focus on households-at-risk who may be in need of acute and emergency services, underserved subpopulations, as well as those who can benefit from preventative services. A common assessment tool (VI-SPDAT[3] or similar) aids the intake and referral process, and encourages

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

uniformity within and between communities. Using a trauma-informed service provision lens and specialized training, multiple system access points and outreach services refer new and existing clients to any community services they may require, including: protective; health; social; housing and emergency shelter; transportation; financial; employment; education and training; accessibility; and other related community and government services. Among these services are the services provided by the Energy Poverty Reduction Program.

Energy Poverty Reduction Program Architecture

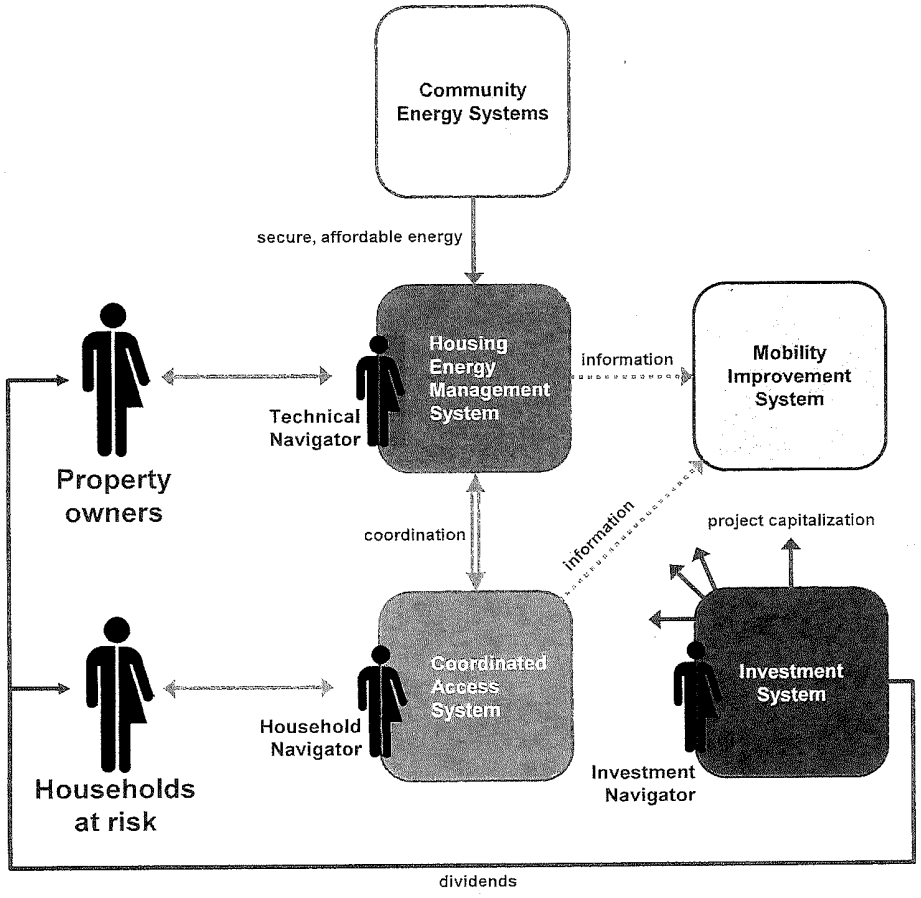

Diagram 1.2

The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement chapter: Partnership Coordination, and Coordinated Access Service Provision.**

Communities that already have a Coordinated Access System in place can leverage those existing services.

Relationship to Data & Connected Technologies: we propose that this service make use of the nationally-accessible Homeless Individuals and Families Information System (HIFIS), hosted by Employment and Social Development Canada (ESDC), as its core data platform. This will facilitate data exchange with community service providers as well as the municipal data platform that will house the rest of the Energy Poverty Reduction Program. The use of this national database would also facilitate inter-community collaborations and performance metric comparisons.

[3] Developed by Org Code Consulting, this assessment tool is widely used in Canada for planning and prioritizing service provision to underserved populations particularly for housing and shelter needs. The tool is already in use in Bridgewater.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Housing Energy Management System

This service provides property owners with turn-key energy monitoring, planning, management, retrofit, and financing services. Services address retrofits to existing housing stock, as well as services and incentives to support the construction of highly efficient new housing units. The target of the program is to achieve a universal energy performance improvement of the community's housing stock of approximately 60%, and to further supplement that with an additional 30% in renewable energy generation, for a total imported energy cost reduction of 90%. Individual energy performance targets will be set for participating properties as part of the client intake process, and will be updated periodically as new energy management solutions become available.

The service consists of 3 sub-programs that are explained in detail in the Performance Measurement chapter: **Program Coordination & Administration, and Housing Retrofits and New Construction.**

The service is designed to leverage existing municipal competencies in asset management and service provision. It also enables communities to leverage and stack existing and emerging energy efficiency programs, whether those have been implemented on the municipal, provincial, or federal levels. In Bridgewater's case, the programming offered through this service will build heavily on, and significantly expand, Efficiency Nova Scotia's energy efficiency services and financial incentives aimed at improving the province's housing stock.

Relationship to Data & Connected Technologies: existing municipal property and financial management software will be used as the core data platform for this program, with the addition of an Energy Management Information System (EMIS) module, and an expansion into Real Time Operations (RTO) functionality. The EMIS interfaces with a network of connected technology points to provide the core energy management functions of energy monitoring, forecasting, and control. The system's functionality is expanded gradually over time as new energy management solutions and community energy systems come online. In Bridgewater's case, the proposed data platform is TownSuite, the Town's current municipal management software.

Community Energy Systems

Supplementing energy improvements in individual homes, this service plans and develops neighbourhood and community-scale energy systems such as solar farms, district heating systems, and microgrids. These systems feed secure and affordable energy to participating properties, and earn dividends for their investors. The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement chapter: Utility Grade Service Provision, and Neighbourhood & Community Scale Energy Systems.**

Communities with their own energy utilities can leverage those existing services to deliver these functions. As community-scale energy solutions will differ based on local and regional context, specific applications need to be tailored to the needs of individual communities. In Bridgewater's case, the community is in the process of exploring the development of its own energy utility, as well as the potential procurement of utility-grade services from an existing utility in the area. Feasibility studies for the selection and implementation of community-scale energy systems are included in the first few years of the program, with a 6MW "solar garden" as the preliminary choice for community-scale energy technology in this proposal.

Relationship to Data & Connected Technologies: community-scale energy systems are powered and controlled by connected digital systems, allowing for a new generation of advanced net-metering, microgrid, and local energy market applications. These functions can effectively integrate into the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

municipal property and financial management software described above.

Mobility Improvement System

This service receives information from the Coordinated Access System and the Housing Energy Management System to plan and implement mobility improvements based on community needs. As municipalities are typically responsible for neighbourhood and community-scale transportation systems, this service will typically integrate with and expand on existing municipal services.

The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement** chapter: **Program Coordination & Administration, Transit System Improvements,** and **Active Transportation Improvements.**

Communities with their own road, trail, and public transit infrastructure would tailor this service to their own infrastructure and services, which may also include regional transportation planning. In Bridgewater's case, intra and inter-community public transit services and active transportation infrastructure improvements are the primary areas of focus, though paratransit and ride sharing services may eventually form part of the service planning model as well.

Relationship to Data & Connected Technologies: mobility improvement planning efforts are enhanced by the use of data from the Housing Energy Management System and the Coordinated Access System through the use of spatial data and transportation network routing and planning, as well as mobility indicators and feedback from clients. These functions can effectively integrate into the municipal property and financial management platform.

Investment System

This service funnels funds from investors into the services described above. Program investors are categorized into (1) social value investors, which include governments and charitable organizations, and (2) financial investors seeking a return on investments from housing and community energy systems. Using creative financing tools, property owners and households-at-risk can also become investors in the system and receive dividends.

The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement** chapter, and expanded on in the **Financial chapter: Municipal Capitalization System, and Financial Investment Vehicle.**

This service builds on existing municipal competencies related to budgeting and asset management. Communities that work closely with external fundraising entities can leverage those relationships to build this system, and those municipalities that are permitted by legislation to use innovative capitalization strategies (e.g. community bonds or green bonds) may make use of those capitalization opportunities as well. In Bridgewater there is no existing Financial Investment Vehicle to leverage, so the implementation of this service includes a period of feasibility assessment and organizational development. Emerging energy financing services, including Energy Services Companies (ESCOs) are anticipated to play a significant role in the capitalization of these improvements both in Bridgewater and across the country.

> We can't judge people like 'How did you forget your child's mittens today?' when there may be water coming in their window, the landlord may not be available; they may be cold, they may be hungry.
>
> – COMMUNITY SERVICE ORGAIZATION

Relationship to Data & Connected Technologies: financial planning efforts and investment opportunities are calculated and driven by the robust EMIS system that forms the core function of the program's data system. Financial planning and management for the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

program can effectively integrate into the municipal property and financial management software described above. External financial investment systems will rely on external data platforms. In Bridgewater's case the external platform still needs to be determined, though for planning and budgeting purposes, the MaRS Centre for Social Innovation's SVX platform is used as the placeholder system for this service.

The relationship between these revised programs and those described in the initial application are summarized in Table 1.4.

The restructuring of the Energy Poverty Reduction Program has significantly improved its implementation potential, as well as improved transferability, scalability, and replicability to other communities.

Original and Revised Program Components

Program Components As Originally Proposed (April 2018)		Revised Program Components
Theme 1: housing and transportation investments	Program A: local clean energy investment system	Investment System
	Program B: comprehensive retrofit improvement program for low-income homes and rental properties	Housing Energy Management System
	Program C: regulations and incentives for the construction of new high-energy-performing affordable rental units	Housing Energy Management System
	Program D: public transit and active transportation service and infrastructure improvements	Mobility Improvement System
Theme 2: resident engagement and capacity building	Program E: engagement program for residents*	Coordinated Access System and Housing Energy Management System
	Program F: clean tech sector trades training program for residents	N/A
Theme 3: partner collaboration and capacity building	Program G: data sharing and collaboration program for partner organizations	Coordinated Access System

Table 1.4 *Program F, the clean tech sector trades training program for residents, was found to be impractical at this time, as local trades training organizations were unable to commit to trades training outcomes and timelines. Instead, the Nova Scotia Community College has provided a letter (see **Appendix**) indicating its ongoing support for the Energy Poverty Reduction Program, and its willingness to explore integration with its Work Integrated Learning courses, the Women Unlimited program, and participating in the Coordinated Access System in order to provide information, where applicable, around training opportunities. The College continues its interest in the creation of new programming options in the areas around Green Energy and Technologies, but this will require additional study and development before the College is able to confirm its offerings.

INNOVATIONS SUITABLE FOR NATIONAL DEMONSTRATION

This high-impact, comprehensive approach to community-based problem solving and transformational change is highly transferrable to communities across the country that are struggling with energy poverty challenges. As the world shifts its energy systems, these transitions will be inherently challenging as economic disruption occurs and less affluent Canadians are saddled with the remnants of outdated or legacy energy systems, whether those are housing technologies or energy systems from the last century. Municipalities are uniquely positioned to take advantage of emerging energy systems, pairing them with data and connected technologies, and delivering robust and accountable services that improve affordability and quality of life for historically underserved populations. In this way, municipalities can play a critical new role in facilitating a transformation for our communities, especially their most vulnerable members, through the coming energy shift.

By selecting Bridgewater as the winner in the $5 million Smart Cities Challenge prize category, Canada will support a powerful new demonstration of technology-enabled community-based problem solving to its stated objectives of addressing both the poverty crisis and the climate crisis at the same time.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

PERFORMANCE MEASUREMENT OVERVIEW

To support the ambitious scope and complexity of Bridgewater's Energy Poverty Reduction Program, we have developed a methodical implementation and performance measurement schedule. The following section outlines the activities and outputs, including deployment schedule and anticipated deliverables for each of the 5 systems that form the overall Energy Poverty Reduction Program: Coordinated Access; Housing Energy Management; Community Energy; Mobility Improvement; and, Investment.

An evaluation framework is proposed and detailed in Table 2.9. A logic model consisting of activities, outputs, and outcomes has been developed to guide the implementation process and allow for ongoing evaluation of program performance and quality. This logic model is illustrated in Diagram 2.1. Table 2.10 details the program outcome indicators, associated measurement methodologies and tracking systems.

Risks associated with the Energy Poverty Reduction Program are comprehensively described in the **Project Management chapter,** which also includes the risk management strategies and associated course correction checkpoints for the program.

PROPOSED PHASING AND PAYMENT SCHEDULE

As detailed in the **Project Management chapter,** progress toward our outcomes are being consistently monitored and measured. To implement the program and achieve the outcomes described above, we propose to receive Infrastructure Canada's grant contribution in 3 installments that are closely tied to the program budget. The contribution amount will cover core program costs (development, administration, and operations, minus any municipal in-kind contribution).

The Energy Poverty Reduction Program consists of a set of 5 interconnected systems that will be deployed in 4 phases; each building off each other with some overlap in the early phases. As a small community with limited resources and no ability to draw significantly from the tax base to implement the program's development, administrative, and operating costs, we propose that each contribution will be provided up-front for the next phase of work to avoid incurring project losses or debt. Therefore, the first contribution will be at the start of the project, while the second and third contributions will be tied to achieving program outputs for Phases 1 and 2, respectively. Table 2.1 describes the timing of phases, core program costs, contribution amounts and the number of households served. Households-at-risk are less likely to also be the property owner. So the number of households served will account for both the inhabitants and the property owners. Program phases:

- **Prototype Program Setup -** This phase includes partnership and governance development; detailed service and technical design; service procurement; client consultation; establishment of risk management and quality control systems and the evaluation framework; as well as a comprehensive Privacy Impact Assessment (PIA) on the detailed program design and an overarching privacy policy.

- **Prototype Program Testing & Refinement -** This phase involves a gradual ramping up of client intake; continuing design and implementation of services and technologies; and monitoring and evaluation of results. Program outcomes become measurable by the end of this phase.

- **Final Program Activation -** This phase requires the finalization of program service design and technical components; extensive documentation of program outcomes; and the development of learning materials for other communities and senior governments. The completion of the Final Program Activation phase marks the end of Smart Cities Challenge contribution agreement.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Program Phases, Core Costs, Contribution Conditions, and Households Served by Fiscal Year

Fiscal Year	2020-21 Year 1	2021-22 Year 2	2022-23 Year 3	2023-24 Year 4	2024-25 Year 5	2025-30 (5 years) Long-term
Phase	1: Prototype Program Setup					
		2: Prototype Program Testing & Refinement

Detailed program design							• program design complete
Staff hiring & training							• staff hired & trained
Database setup							• data platform created
Program established and serving clients		50 clients	75 clients	100 clients	175 clients	750 clients	• Clients (households and/or property owners) served by program
IT system maintenance							• data and IT systems maintained (ongoing)

Table 2.2

- **Program Maturity -** This phase includes ongoing client intake; program evaluation and improvement as well as the integration of new and emerging community energy technologies and solutions.

Coordinated Access System

PROGRAM ACTIVITIES AND OUTPUTS

COORDINATED ACCESS SYSTEM PROGRAM ACTIVITIES AND OUTPUTS

This program pulls together the partner organizations and service providers required to design and deliver a successful Coordinated Access System. It also maintains relationships and information sharing between the partners. As a service that will be contracted out to a qualified third-party organization, the Town of Bridgewater will work collaboratively with its community partners to develop the scope of the service, and to establish quality control parameters and performance metrics. In doing so, we will work closely with experts and expert organizations in this field, including provincial and national agencies with interests and expertise in coordinated access services.

- **Partnership development:** partner agencies will be brought together and will sign a memorandum of understanding for engaging in the Coordinated Access System.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Partners will be consulted through a series of workshops on the service model, process work flow, and governance structure. Existing community collaborations to leverage include the Lunenburg County Community Hub which already brings together a wide spectrum of government and non-profit service providers in a coordinated continuum of practice to support early intervention and health promotion efforts as well as to coordinate case care.

- **Program evaluation & improvement:** partners participate in ongoing program evaluation and improvement, with key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service. Evaluation processes will be led and supported by staff and will involve client feedback on a regular basis.

Third party service providers will participate in an open procurement process for the provision of this service. Starting with a request for expressions of interest and culminating in a long-term service agreement, the Town of Bridgewater and its partners will assess service providers' expertise, capacity, and ability to deliver quality services that match the desired program scope. Service provision for this program may be paired with, and enhanced through, provision of Coordinated Access Services to a larger clientele than is envisioned through the Energy Poverty Reduction Program (e.g. for clients outside of Bridgewater). However, sufficient capacity and funding will need to be evident to ensure that program quality is maintained. Client services begin in 2021-22, and increase annually for each of the 3 remaining program years until the program reaches its mature state. The program partners will work closely with the service delivery organization to ensure that program quality is maintained; that information sharing and privacy obligations are met; and the program outcomes are being achieved.

- **Detailed program design:** building on the scope of work for the procured services, the service delivery partner will undertake the comprehensive design of the Coordinated Access Service. Specialized partners may be engaged in this stage, such as the Family Service of Western Nova Scotia or the Affordable Housing Association of Nova Scotia, both of which are currently active in developing coordinated access systems for their constituencies.
- **Staff hiring & training:** qualified staff, known in this program design terminology as the "Household Navigator(s)", will be hired and trained by the service delivery organization to support program design and to deliver the coordinated access service. Staff will be Clinical Social Workers who are licensed to practice in Nova Scotia. The service delivery partner will start by hiring 1.5 FTEs, which it will be able to expand to 2 FTEs by year 4. Staff will receive training in the specific clinical and administrative functions that will be required by the Energy Poverty Reduction Program, and they will be trained to use the program's data platform.
- **Database setup:** the Homeless Individuals and Families Information System (HIFIS) is readily customizable by service providers, and will be set up with the appropriate data entry forms and reporting forms required for the Coordinated Access System. As a free service with plenty of user support, this effort will be primarily carried out in-house by the Household Navigator(s), with an allowance for technical support and equipment (e.g. tablet computers for mobility).
- **Serve clients (2021 through 2030):** client service provision involves intake by the Household Navigator(s) from multiple referral points in the community, assessment and triage using a standardized intake tool (VI-SPDAT or similar), and referral to any and all community services the household may require. The Household Navigator maintains contact with

Page 837 of 1849
Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

each client, providing the level of supportive service the household requires. The Navigator maintains client information in the HIFIS database, and only shares limited information, with the client's permission, with the rest of the Energy Poverty Reduction Program.

- **IT system maintenance:** there will be ongoing maintenance of the HIFIS system database, data entry and reporting forms, and maintenance of equipment.

- **Communications & marketing:** the program partners will design and implement a Communications Strategy for the Coordinated Access System which will include the following: (1) creating a clear understanding among all partners facilitating coordination of how the Coordinated Access System will function and how to engage residents on the system; (2) roll-out and maintenance of the Communications Strategy to inform underserved populations of the system; (3) ongoing communications with partners and funders to communicate the outcomes and evaluation of the service.

Housing Energy Management System

HOUSING ENERGY MANAGEMENT SYSTEM PROGRAM ACTIVITIES AND OUTPUTS

Extensive analysis of Bridgewater's housing stock started with the Community Energy Investment Plan from 2016 to 2018. The analysis resulted in the classification of the housing stock into 32 "archetypes" based on the type, size, and age of the homes. A fully-costed retrofit program was conceptually modelled for the entire residential sector, using ambitious energy targets: greater than 50% thermal and electrical energy efficiency gains, plus the widespread addition of on-site renewables and battery storage. New construction targets were set at Net Zero Ready (NZR) or Net Zero (NZ), which the Government of Canada has established as long-term targets for the national Building Code.

The housing stock model was refined for the Energy Poverty Reduction Program. It adjusted the energy performance targets for retrofits to 60% efficiency improvement coupled with an additional 30% on-site or neighbourhood renewable energy generation. It also updated the capital costs for retrofits which were sourced from recent case data from local and provincial energy retrofit programs including the Clean Net Zero and Affordable Multi Unit Pilot programs. Connected technology solutions for both retrofits and new construction were added, and a redistribution of the housing archetypes based on extensive community surveying to identify the housing stock most affected by energy poverty was undertaken. All client properties will have access to the following energy management improvements, as long as they meet technical and financial feasibility criteria:

- On-site or neighbourhood renewable energy generation (solar hot water + solar PV)
- Highly efficient mechanical systems (targeting air source heat pumps)
- High levels of ceiling, basement and wall insulation, as well as a high degree of air sealing
- Energy efficient and smart appliances
- LED lighting
- Energy monitors, smart thermostats, and other connected technologies
- Energy management education and training

The housing infrastructure improvements function as the technical backbone of Energy Poverty Reduction Program. Energy efficiencies gained by the infrastructure improvements will be measured and monitored via the connected technology solutions discussed in detail in the **Technology chapter.** Energy and climate benefits calculated through our custom housing stock improvement model estimate 4.8 GWh of energy and 2.5 kilotonnes of greenhouse gas emissions (GHG) reduced by 2024-25, with an additional reduction of 10.1 GWh of energy and 5.9 kilotonnes of GHG emissions reduced by 2029-30 (cumulative).

- **Partnership development:** partnerships will be established with key players in the energy and housing landscape, including Efficiency Nova Scotia, Nova Scotia Power, the South Shore Housing Action Coalition, and a number

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Housing Energy Management System: Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Staff hiring & training							• staff hired & trained
Technical navigation services for clients							• technical navigation & support services provided
Detailed program design							• program design complete
Database setup - municipal enterprise resource planning (ERP) system							• data platform created
Database setup: energy management information system (EMIS)							• data platform created
IT system maintenance							• data and IT systems maintained (ongoing
Plan & implement retrofits and new construction		45/5	68/7	91/9	114/11	682/68	• units retrofitted/units constructed
Service & supplier procurement & coordination							• services & suppliers procured in cohorts (phase 2 onward) • performance management or procured services & suppliers (phase 2 onward) • dialogue and capacity building with related industries (phase 2 onward)
Community engagement							• clients consulted on design (phase 1) • clients consulted on prototype test (phase 2) • ongoing consultation with clients (ongoing)
Program administration							• program administration services delivered (ongoing)
Program evaluation & improvement							• program outputs and outcomes evaluated, and program improvements made (ongoing)

Table 2.3

of government agencies. Key among partner activities is the sharing of information related to energy solutions and costs. Partners may participate in the program Steering Committee, support the development, implementation, and evaluation of the program, and may provide services under contract to the program or the program's clients.

- **Staff hiring & training:** staffing for the program will consist of the following:
  - 1.5 FTE positions for the "Technical Navigator(s)" who will be technical staff with training and experience in building science and energy efficiency and at least one of whom will be a professional Engineer licensed to practice in Nova Scotia. Staff will receive training in the program's administrative and technical systems, and ongoing professional development related to community-based energy management services and large scale community energy systems.
  - 1 FTE position for an Information Systems Specialist who will support the design and management of the program data platforms including the Energy Management Information System (EMIS). Staff will receive training in related data management systems: TownSuite, EMIS, and Real Time Operations systems.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès

- **Technical navigation services for clients:** services will be provided by the Technical Navigators to participating property owners. Services will begin with client intake and property registration, and depending on the property owner's needs, can involve a comprehensive suite of services including planning and assessment; monitoring and targeting; measurement and verification; performance verification; performance contracting; troubleshooting/ fault detection; risk monitoring and control; contractor coordination (turn-key services); auditing; financial planning; and energy management education services. Services will cater both to retrofits as well as to new construction.

- **Detailed program design:** led by program staff and guided by the program partners, a detailed program design will incorporate best practices in community-scale energy efficiency programming, with an eye to achieving deep energy retrofits and highly efficient new construction. Informed by leading programs in the region, from across Canada, and internationally, attention will be focused on ensuring program accessibility for clients, mitigating problems commonly faced by landlords, and on making use of emerging connected technologies such as smart submeters and smart thermostats to achieve desired energy efficiencies and related household energy savings.

- **Database setup - municipal enterprise resource planning (ERP) system:** we will work with our municipal data platform provider, TownSuite, to set up the Enterprise Resource Planning (ERP) system backbone to support the program. The ERP is described in detail in the **Technology chapter.**

- **Database setup - energy management information system (EMIS):** complementing the development of the ERP is the development of the EMIS module of the data platform. The module will interface with the ERP and provide the core energy monitoring and planning functionality of the program. Due to its complexity, the development of the core functionality of the EMIS will fully span Phases 1 and 2. The EMIS and its associated advanced functions (including real time operations systems) is described in detail in the **Technology chapter.** Technical risk involved with designing and deploying the EMIS system has been identified as a significant program risk, justifying the need for this time and effort. This is discussed in the Risk Management Section of the Project **Management chapter.**

- **IT system maintenance:** ongoing maintenance and licensing fees associated with the data platforms described above, and maintenance of equipment.

- **Service & supplier procurement & coordination:** the Technical Navigators will issue periodic calls for contractors and suppliers, collectively known as Energy Service Providers. Management of those procurements and contracts will require ongoing effort. Supply chain risk involved with procuring these services has been identified as a significant program risk, justifying the need for this time and effort.

- **Community engagement:** the Technical Navigators will be involved in engagement and consultation efforts with program clients (households-at-risk as well as property owners) both to inform program design and prototyping as well as for ongoing program evaluation.

- **Program administration:** administration of the program will involve ongoing program management, monitoring, reporting and human resource development.

- **Program evaluation & improvement:** partners participate in ongoing program evaluation and improvement, with

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service. Evaluation processes will be led and supported by staff, and will involve client feedback on a regular basis.

- **Communications & marketing:** we will design and implement a Communications Strategy for the Housing Energy Management System which will include the following: (1) developing a marketing strategy to engage property owners and households-at-risk in the program, which will likely involve branding the program without the use of the term "energy poverty"; (2) roll-out and maintenance of the Communications Strategy to inform all clients of the service; (3) ongoing communications with partners and funders to communicate the outcomes and evaluation of the service.

RETROFITS AND NEW CONSTRUCTION

The Town of Bridgewater will engage partners to create a common vision informed by the community for the development of affordable, green, and accessible housing in Bridgewater. The Town will conduct a housing needs assessment to identify demographics, gaps in housing provision and existing housing stock. The Town will undertake steps to incorporate policies into Town plans to ensure affordable and energy efficient homes are a council priority. Regulatory structures and incentives will be put in place in accordance with recommended actions outlined in Bridgewater's Community Energy Investment Plan (2018). The Technical, Investment, and Household Navigators will provide service coordination for homeowners and those in housing need to access programs available through the Housing Energy Management System, Financial Investment Vehicle, and Coordinated Access System.

The Town will take several actions to incorporate policies, create regulatory incentive frameworks, and enable financing opportunities to ensure that retrofit and new construction meets the energy efficiency and affordability targets of our application. First, the Town's Municipal Planning Strategy (2014) will be amended to include policies for housing energy efficiency targets laid out in the Town's Community Energy Investment Plan (2018). This may include creating a specific energy efficiency overlay zone to incent retrofits, upgrades and building to higher standards than the current building code requires. Further polices will be added in support of mixed tenure, affordable housing congruent with existing policies for supporting the construction of a range of higher density, mixed-use infill development in the Town's core. The Town's criteria for evaluating proposals for land use by-law amendments and development agreements will be amended to ensure that staff and Council shall consider the energy efficiency and affordability of housing when making decisions.

As per the Town's Community Energy Investment Plan (2018) additional policies outside of the land use planning documents will be pursued. These include:

- Maintain and expand annual financing limits for Property Assessed Clean Energy Financing to incentivize property owners to build to a higher energy efficient standard, and explore opportunities to expand program eligibility to include multi-unit residential, commercial, and institutional buildings.
- Establish incentives to support and encourage highly energy efficient building practices for residential development.

In Nova Scotia, the responsibility for affordable housing lies with the provincial government through Housing Nova Scotia. Municipalities do not have a legislated requirement, but a societal expectation to provide for the needs of their residents and community. Bridgewater Town Council identified the need to play a stronger role in providing affordable housing well

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

before the development of the Energy Poverty Reduction Program. But it did not have the broad community support for or deep understanding of the relationship between housing infrastructure, energy management and overall poverty to go beyond general policies of smart growth, residential infill and densification. Catalyzed by this deeper understanding of energy poverty, Council may develop policies to actively attract and support the development of affordable, energy efficient housing. This may include policies to facilitate the sale of town-owned land to a non-profit housing body for less than market value; and, to limit municipal taxes and/or fees for properties owned by a company or corporation established for the purposes of non-profit housing services.

The housing retrofit program will serve all major housing types in the community, including single detached, semi-detached, mobile home, and multi-unit resident buildings (MURBS). The Town's Community Development staff and the Technical Navigators will play a critical role in communicating these opportunities to property owners early in the development phase.

Community Energy Systems

COMMUNITY ENERGY SYSTEMS PROGRAM ACTIVITIES AND OUTPUTS

The development of utility grade services, either directly by the Town of Bridgewater, or procured through a third-party provider, has been selected as the most practical and economical pathway toward neighbourhood and community scale energy system development in Bridgewater. The activities described in Table 2.4 will be initiated by our technical project team (Project Coordinator, Technical Navigators, and Investment Navigator), with the support of externally-procured consultation and engineering services.

- **Technical resource assessment:** expanding on the preliminary work completed through the Community Energy Investment Plan, a detailed technical review of energy consumption and various energy generation sources (solar, wind, hydro etc.) will be assessed. This process will involve independent analysis of various renewable resources, and the cost to produce energy. Paramount to this step will be assessing fit between consumption patterns and renewable generation technologies, as poorly matched generation and consumption patterns can lead to technical and financial inefficiencies, and increase the requirement of energy storage.

- **Municipal utility detailed service design:** the first step of investigating and establishing a Municipal Utility Grade Service will be to establish the scope and design frame of this approach. In general, utility grade service can involve the generation, distribution and sales of electricity, data collection and assessment, and integration of connected technology such as demand control, sensors and energy storage. This first step will involve both a technical and a legal/regulatory review to define scope, best practices and to specific regulations and applications required.

- **Municipal utility setup and/or service procurement:** the most important part of this scope will be facilitating agreement with the incumbent utility, Nova Scotia Power. While the scope of utility service provision can vary significantly, there will always have to be a significant interaction with NS Power at the point of interface. This discussion would include such items as transmission and distribution system access, top up and spill provisions, emergency response, grid ancillary services and administration. The commercial terms of this agreement will have a major impact on the financial variability of power generation and sales in the community. An additional aspect to this set up process is determining the entity that performs this service. Three options exist: (1) expand existing municipal utility, (2) new stand-alone new municipal utility, and (3) a public-private partnership (P3)

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

arrangement for service provision to a municipal utility.

- **Legislative and regulatory approval process:** while the regulatory process is defined, agreements will have to be in place with NS Power in order to proceed with any certainty through the application process. Of the three types of service noted above, only the generation and distribution of electricity is currently contemplated by the *Public Utilities Act*. Value added services through data and control of connected technologies such as demand control and energy storage would not require the regulatory process of establishing a municipal utility.

- **Database setup:** as detailed in the **Technology chapter,** the Energy Management Information System will be set up in such a way as to ensure future compatibility with community energy systems. While detailed IT integration in this regard cannot be completed until the time the specific technology is installed, a number of important functional components need to be prepared in the EMIS to enable this integration down the road.

- **Utility grade service management:** once all of the above is complete, Bridgewater will be in a position to offer utility grade energy services. With careful attention to financial considerations as discussed in the **Financial chapter,** work can begin in capitalizing the utility and providing service.

Community Energy Systems: Utility Grade Service Provision Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Technical resource assessment							• community-wide energy generation feasibility study complete
Municipal utility detailed service design							• utility grade services designed
Municipal utility setup and/or service procurement							• municipal utility established
Legislative & regulatory approval process							• legislative & regulatory approvals achieved
Database setup							• data platform created
Utility grade service management							• municipal utility services delivered (ongoing)

Table 2.4

SOLAR GARDEN DEVELOPMENT

The development of a community-owned "solar garden" has been selected as the preliminary technology for the neighbourhood-scale energy system for the Energy Poverty Reduction Program, as early assessments have suggested that such a system would lend itself well to delivering the outcomes proposed under this program. However, the final selection of the energy technology will be contingent on the outcome of the technical resource assessment described on the previous page. We are anticipating approximately 6MW of Community Solar Garden to be built in the first 5 years of our program. This will start in year 3, and supply the remaining load from the Housing Retrofit homes as well as 75-200 additional customers per year from the community. Each annual addition of solar generation capacity would be financed, so that payments made by the customers would cover the loan on the project. More detail on this and ownership structures can be found in the in the **Financial chapter.**

Conceptual design: a detailed assessment of the size and scale of the solar community garden would first be conducted. It would grow annually as more retrofits are completed. This stage

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Page 843 of 1849

would also consider if additional community participation to that of the neighbourhood retrofits could be considered. The end result of this stage should be a detailed financial proforma for each year's installation, along with the cumulative cashflows of the facility.

Fundraising & financing: this stage will span the project schedule from start to operation. Different types of financing will be available at different stages of project development. The various contracts with customers for the sale of power from the facility will be the key asset upon which the community entity can raise the equity and debt investment for the project. More information is available in the **Financial chapter.**

Community consultation: early and open transparency regarding project location, timelines, construction and environmental impact will be essential to this project's social acceptance. Open house style engagements have proven to work well with previous renewable energy projects in Nova Scotia of a similar scale (ie. COMFIT, SolarCity).

Detailed engineering design: once the concepts and project financing are established, detailed engineering design will take place. This will involve geotechnical, structural, and electrical design. There are many firms with local representation that have experience in design projects of similar sizes, and public procurement of these services will take place.

Permitting: permitting requirements for the project will include municipal, electrical utility and any additional environmental permissions.

Procurement: procurement will take place in stages as solar garden components are funded over 3 consecutive years. The market for renewable energy equipment is well established in Canada and globally. Costs can vary over time due to market efficiencies and changes in tariffs. Delivery schedule is usually tied to the placement of a firm order and can range from three months to two years, though for a smaller solar project 1-2MW in size at a time it is expected be on the shorter end of that timeframe. Placing an order for equipment will also require deposits to be paid.

Construction: the solar garden would be ground mounted with power generated collected to common points and connected to the NS Power electrical system. Major scopes of work for construction would be: (1) supply of panels and related equipment, (2) civil/roads, (3) structural (foundations and racking), electrical installation, and commissioning/testing. It is common that many of these scopes be combined into a generation contractor agreement, or an Engineer, Procure, Construction (EPC) contract.

Community Energy Systems: Solar Garden Development Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Conceptual design							• conceptual design complete
Fundraising & financing							• financing & funding targets achieved
Community consultation							• community consultants complete
Detailed engineering design							• detailed engineering design complete
Procurement							• services & suppliers procured
Permitting							• permits achieved
Construction							• construction complete
Database & IT systems setup							• IT systems installed
Commissioning							• commissioned
Operation & maintenance							• maintained (ongoing)

Table 2.5

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Database & IT systems setup: all modern community scale energy generation systems come with internet addressable controls systems. It will be important to ensure that data from this system can be integrated to the Town's EMIS. Generally, this interaction is undertaken with the solar technology provider.

Commissioning: the designer and installers of the solar garden will take on performance risk of the installation, to help make sure that the solar garden performs properly before the Town and the project investors accepts the installation in to operation.

Operation & maintenance: modern solar energy systems come with 25 year warranties on panels, and 10 years+ on other components such as racks and inverters. The community solar garden will contract for spare parts provisions and maintenance service provision, as well as for operational oversight.

Mobility Improvement System

MOBILITY IMPROVEMENT SYSTEM PROGRAM ACTIVITIES AND OUTPUTS

This service receives client mobility information from the Housing Energy Management System through the Technical Navigators, and from the Coordinated Access System through the Household Navigators, and uses it to plan and implement transportation improvements in the community. Implementation of improvements must be approved by Town Council through annual budgeting processes, and if approved are implemented by the Bridgewater Transit system and Engineering Department. While the program is focused on transit and active transportation modes at this time, future integration with rideshare and paratransit services is a real possibility that would be further enhanced through the planning functionality provided by this program.

- **Detailed program design:** planning staff will work with community partners to finalize the program scope and develop its technical methodologies. This will take place over a two-year timeframe to ensure integration with the overall program data platform, and to involve the first year of program clients directly in the design process.

- **Partnership development:** partnerships will be established with key players in the transportation and accessibility landscape, including members of the Bridgewater Active Transportation Committee, a standing Committee of Council with strong ties to community service providers.

- **Database setup:** the municipal enterprise resource planning components of the municipal data platform will be expanded to include a Client Mobility Application module. This will link with the existing Land Management GIS module to enable transportation planning through the use of spatial data from other parts of the system. Specifically, the civic addresses of program clients will be linked with transit and active transportation routing maps, and made to perform transportation planning calculations, including walking distance to the nearest bus stop and sidewalk or trail network. Mobility indicators are tracked by neighbourhood, with the goal of seeing improvement over time as enhancements are made.

- **IT system maintenance:** ongoing maintenance and licensing fees associated with the data platforms described above, and maintenance of equipment.

- **Community engagement:** staff will be involved in engagement and consultation efforts with program clients (households-at-risk as well as property owners) to inform program design and prototyping as well as for ongoing program evaluation.

- **Communications & marketing:** we will design and implement an

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Mobility Improvement System: Program Coordination & Administration Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Detailed program design							• program design complete
Partnership development							• partnership established
Database setup							• data platform created
IT system maintenance							• data and IT systems maintained (ongoing)
Community engagement							• clients consulted on design (phase 1) • clients consulted on prototype test (phase 2) • ongoing consultation with clients (ongoing)
Program administration							• program administration services delivered (ongoing)
Program evaluation & improvement							• program outputs and outcomes evaluated, and program improvements made (ongoing)

Table 2.6

improved Communications Strategy for the community's transit and active transportation systems, which will include the following: (1) developing a marketing strategy to engage residents in the program, which will build on engagement recommendations from the renewed Active Transportation & Connectivity Plan; (2) roll-out and maintenance of the Communications Strategy; (3) ongoing communications with partners and funders to communicate the outcomes and evaluation of the service.

- **Program evaluation & improvement:** partners participate in ongoing program evaluation and improvement, with key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service.

TRANSIT SYSTEM IMPROVEMENTS

Bridgewater Transit has been operating successfully since 2017. As a new municipal service, improvements to transit routing and service delivery have been occurring on a regular basis. The transit service can benefit substantially from the enhanced planning functionality provided through this program.

Transit service improvement planning includes: making periodic routing adjustments, improving transit service accessibility, quality improvement measures, improvements to communications and marketing systems, and the integration of connected technology functions to the bus service. Already, a GPS locator in the bus allows for real-time tracking of the bus for the public. Additional service and communication enhancements based on connected technologies may include the development of client notification, survey, and complaint functions, as well as opportunities to provide real-time transit information to service providers including agencies that support under-served residents. Transit improvements are subject to Council approval on an annual basis. Transit service improvements will be documented and evaluated on an ongoing basis.

ACTIVE TRANSPORTATION IMPROVEMENTS

Active transportation planning and evaluation efforts can benefit substantially from the enhanced planning functionality provided through this program. Active transportation improvements will build on the recommendations and solutions provided through Town's Active Transportation and Connectivity Plan, which was developed in 2008 and which will be comprehensively renewed in 2019.

The nature of AT infrastructure improvements will depend entirely on the neighbourhoods that

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

are selected for priority improvement. A budget has been proposed that represents approximately double the Town's current annual budget for these annual improvements. The budget allows for a combination of neighbourhood-based AT improvements, such as the installation of new sidewalks, replacement or upgrade of existing sidewalks, improved crosswalk paint and accessibility infrastructure, the addition of lighting in underlit areas, and making improvements to the Town's trail systems. AT improvements are subject to Council approval on an annual basis. Improvements will be documented and evaluated on an ongoing basis.

Investment System

MUNICIPAL CAPITALIZATION SYSTEM

This system provides core financial budgeting and capitalization services to the other program services. It is responsible for "specialized finance" stacking, assembling project opportunities and outcomes, and reporting to funders. It interfaces closely with the Financial Investment Vehicle, which brings additional private investment into the program. This program is explained in detail in the **Financial chapter** of this proposal.

- **Detailed program design:** program design will be carried out primarily by the Investment Navigator with the support of the program partners. Program design ensures that both the municipal capitalization system and the financial investment vehicle systems work cohesively and with fluidity. In order to do so, workflows and timelines need to be well-established. Focus groups and a gap analysis will determine the missing capacity to deliver on investment system outcomes, and controls designed to ensure operations do not derail.

- **Database setup:** the municipal database is to be defined and created in parallel with the detailed program design. The municipal enterprise resource planning platform will allow this financial budgeting and reporting functionality. Database requirements will be clearly articulated to the development team, and the developer and Town will correspond throughout the development process. The developer will receive a list of necessary components, and a testing team composed of various stakeholders, both internal and external to the Town, will be sourced to test its functionality.

- **Staff hiring and training:** staffing for this service will consist of 1 FTE position for the "Investment Navigator" who will have training and experience in financial management, analysis, and budget development, with preference given to someone with a background in large scale project finance and investment and an interest in the clean tech-sector and project-aligned social values. Staff will receive training in the program's administrative and technical systems, and ongoing professional development related to community-based financial planning services.

- **Partnership Development:** partnerships will be developed with three key groups: funders, investment vehicle services, and community capacity building organizations. The Investment Navigator will approach federal, provincial, and philanthropic funders to ensure robust funding streams are explored. Investment vehicle service partners are needed to set up and deliver the external investment vehicle described below. Community capacity building partners include local credit unions that are willing to act as financial literacy support organizations for program clients. Partners may participate in the program Steering Committee, and will support the development, implementation, and evaluation of the program.

- **Project financial planning:** on an ongoing basis, staff will calculate funding requirements for projects defined and projected by the Energy Poverty Reduction Program, and pool together project components into capitalizable groupings that are attractive

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

to traditional, community, and specialized investors. This budgeting exercise will be facilitated by partnership opportunities established through partnership development activities and will rely on the database module developed for the program. Dynamic data sharing with the Financial Investment Vehicle is a key activity throughout the planning stage.

- **Plan, confirm and administer funding (2021 through 2030):** once specific projects are identified and pooled into groups, the Investment Navigator seeks specific funders to commit to those investment raises, until funding targets are met. Understanding that most funders operate on annual budgets, a recurring approach to raising specialized sources of capital will be undertaken. Annual administrating tasks include updating the database and reconciling accounts.

- **Reporting to funders:** reporting will be automated to the greatest extent possible to allow for real-time monitoring of project outcomes specifically pertaining to funding obligations. It is expected that each source will require different reporting criteria and on different schedules. These activities will be administered by the Investment Navigator.

Investment System: Municipal Capitalization System Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Detailed program design							• program design complete
Database setup							• data platform created
Staff hiring & training							• staff hired & trained
Partnership development							• partnership established
Project financial planning							• project financial planning completed (ongoing)
Plan, confirm, and administer funding 2021-30		$1.71	$2.28	$3.03	$3.83	$25.82	• millions raised in project funding from specialized investors
Reporting to funders							• project reporting needs satisfied (ongoing)
IT system maintenance							• data and IT systems maintained (ongoing)
Program evaluation & improvement							• program outputs and outcomes evaluated, and program improvements made (ongoing)

Table 2.7

- **IT system maintenance:** ongoing maintenance and licensing fees associated with the data platforms and maintenance of equipment.

- **Program evaluation and improvement:** partners participate in ongoing program evaluation and improvement, with key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service. For example, it is expected that new technologies, financing mechanisms, and funding sources will evolve throughout the 10-year program and arrangements that were once not well suited may become more feasible over time. Evaluation processes will be led and supported by the Investment Navigator, and will involve client feedback on a regular basis.

FINANCIAL INVESTMENT VEHICLE

This program complements the Municipal Capitalization System but is external to the Town of Bridgewater, with services procured through

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

an existing or new organization. The program is responsible for traditional financing (inclusive of community investments), cash disbursements through outcome-data shared by the municipal capitalization system, investing in energy poverty reduction program assets, and reporting to investors. This program is explained in detail in the **Financial chapter** of this proposal.

Investment System: Financial Investment Vehicle Activities and Outputs

Activity	Year						Outputs
	1	2	3	4	5	long term	
Investment vehicle organization creation and/or service procurement							• investment vehicle organization created
Administration & Reporting							• administration & reporting services delivered (ongoing)
Plan, sell, and administer investment raise 2021-30		$0.74	$7.69	$9.0	$8.86	$10.78	• millions raised in project financing from financial investors

Table 2.8

- **Investment vehicle organization creation and/or service procurement:** an organization that provides the best value to the Town and the Energy Poverty Reduction Program is procured. Target services include: the ability to set up community-based investment vehicles and organizational structures (see **Financial chapter** for details) the capacity to source traditional and community financing, adherence to appropriate best practices, and utilization of a comprehensive data-security and privacy plan. A unique organizational structure must be incorporated, appropriate bylaws must be drafted, and a governance structure that aligns with the Town's needs must be set up. Once sourced or built, an agreement with the Town must be drafted and executed. To support this service procurement process, financial investment vehicle and investor-related service delivery partnerships will be explored early in the partnership development process. For the purpose of this application the MaRS Centre for Impact Investing, whose SVX platform connects investment opportunities with impact investors, is being considered as a useful template for this service.

- **Administration and reporting:** Reporting should be automated to the greatest extent possible and allow for real-time monitoring of project outcomes specifically pertaining to what the funding source needs to access. It is expected that each traditional source will require different reporting criteria and varying schedules. These activities and the deployment of funds will be administered by the organization with data shared between the Municipal Capitalization System and the Financial Investment Vehicle.

- **Plan, sell, and administer investment raises (2021 through 2030):** activities are dependent on the two financing streams: traditional and community. Both require separate offering terms, due diligence activities and marketing narratives. The organization will be responsible for sourcing traditional debt investments paired with equity raises. These raises will be enhanced through third-party data and connected technology applications. Raising funds involves the development of a marketing strategy, inclusive of buying cycle projections, an elevator pitch and lead nurturing strategies. Investor onboarding activities continue throughout the "raise" and "manage" cycle and include subscription processing, and investor and financial institution correspondence. Monitoring investor satisfaction is a key component to ensuring investment raises are sustainable year-to-year. Additional information is provided in the **Financial chapter.**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

EVALUATION MODEL

In the Energy Poverty Reduction Program, there are multiple stakeholders and partners, a need to make quick decisions, prototyping of new programs, and high levels of uncertainty. Developmental evaluation is appropriate for this type of work because the governance and management team are ready and willing to test new approaches and make changes along the way to reach the goal of energy poverty reduction. Using these evaluation methods will allow the opportunity to blend qualitative and quantitative reporting.

As the evaluation process will be in tune with the evolving program dynamics, achievements, and struggles, it also plays an important role in the design and implementation of the program's risk management strategy and associated course correction checkpoints, which are described in the **Project Management chapter.**

Overall Program Management: Evaluation Framework

Phase	1: Prototype Program Setup	2: Prototype Program Testing & Refinement	3: Final Program Activation	4: Program Maturity
Ongoing Project Evaluation Priorities		• Continuous reflection of role clarification • Partner relations • Guiding principles • Project structure	• Quality of learning cultures • Existing and new project teams • Responsiveness • Moments of innovation	
Phase-Specific Evaluation Priorities	Design by Core Team • Partners – clarification of roles • Identify and build relationships with individual champions • Identify expertise of identified partners • Identify guiding principles and clarity of project charter • Leverage historical experiences • Establishment of project structure • Encouraging and identifying innovations in project design	Early Changes • Highlight new and emerging leadership • Consider internal and external creative tensions • Revisit guiding principles • Review lessons learned • Review and adapt project structure • Document innovations from prototyping • Consider emerging risk • Scaling project • Anticipate blocks to progress	Systems Changes • Revisit guiding principles • Review and adapt project structure • Leverage learned innovations • Establishment of ongoing project charter • The establishment of ongoing structure	Population Changes • New partners: funding, human resources, skills, leadership. • Operationalize the innovations
Desired Outcomes	• Project charter providing useful guidance • Core team/participants report feeling engaged in project • Systems to direct the project are established and useful	• New collaborations consistent with Guiding Principles are established • New funding and financing opportunities are identified • The practical usefulness of data collection systems are improved	• New resident and partner-informed programs and process are developed • New volunteer and agency leadership is engaged • Local collaborations to sustain impact post project are established	• Reducing Energy Poverty is considered a local 'movement' rather than a project • Residents pulled out of energy poverty are championing the impact • Local agencies, institutions and organizations are supporting counterparts in other jurisdictions to make changes to decrease EP.
Evaluation Outputs for Infrastructure Canada	• Phase 1 output report. Key output target: program governance, management, and evaluation systems in place	• Phase 2 output report • Phase 2 preliminary outcomes report	• Phase 3 output report. Key output target: Phase 3 program outputs and outcomes evaluated • Phase 3 final outcomes report	• Phase 4 output and outcomes reporting not applicable to Infrastructure Canada under this funding agreement

Table 2.9

Energy Poverty Reduction Program Outcomes Logic Model

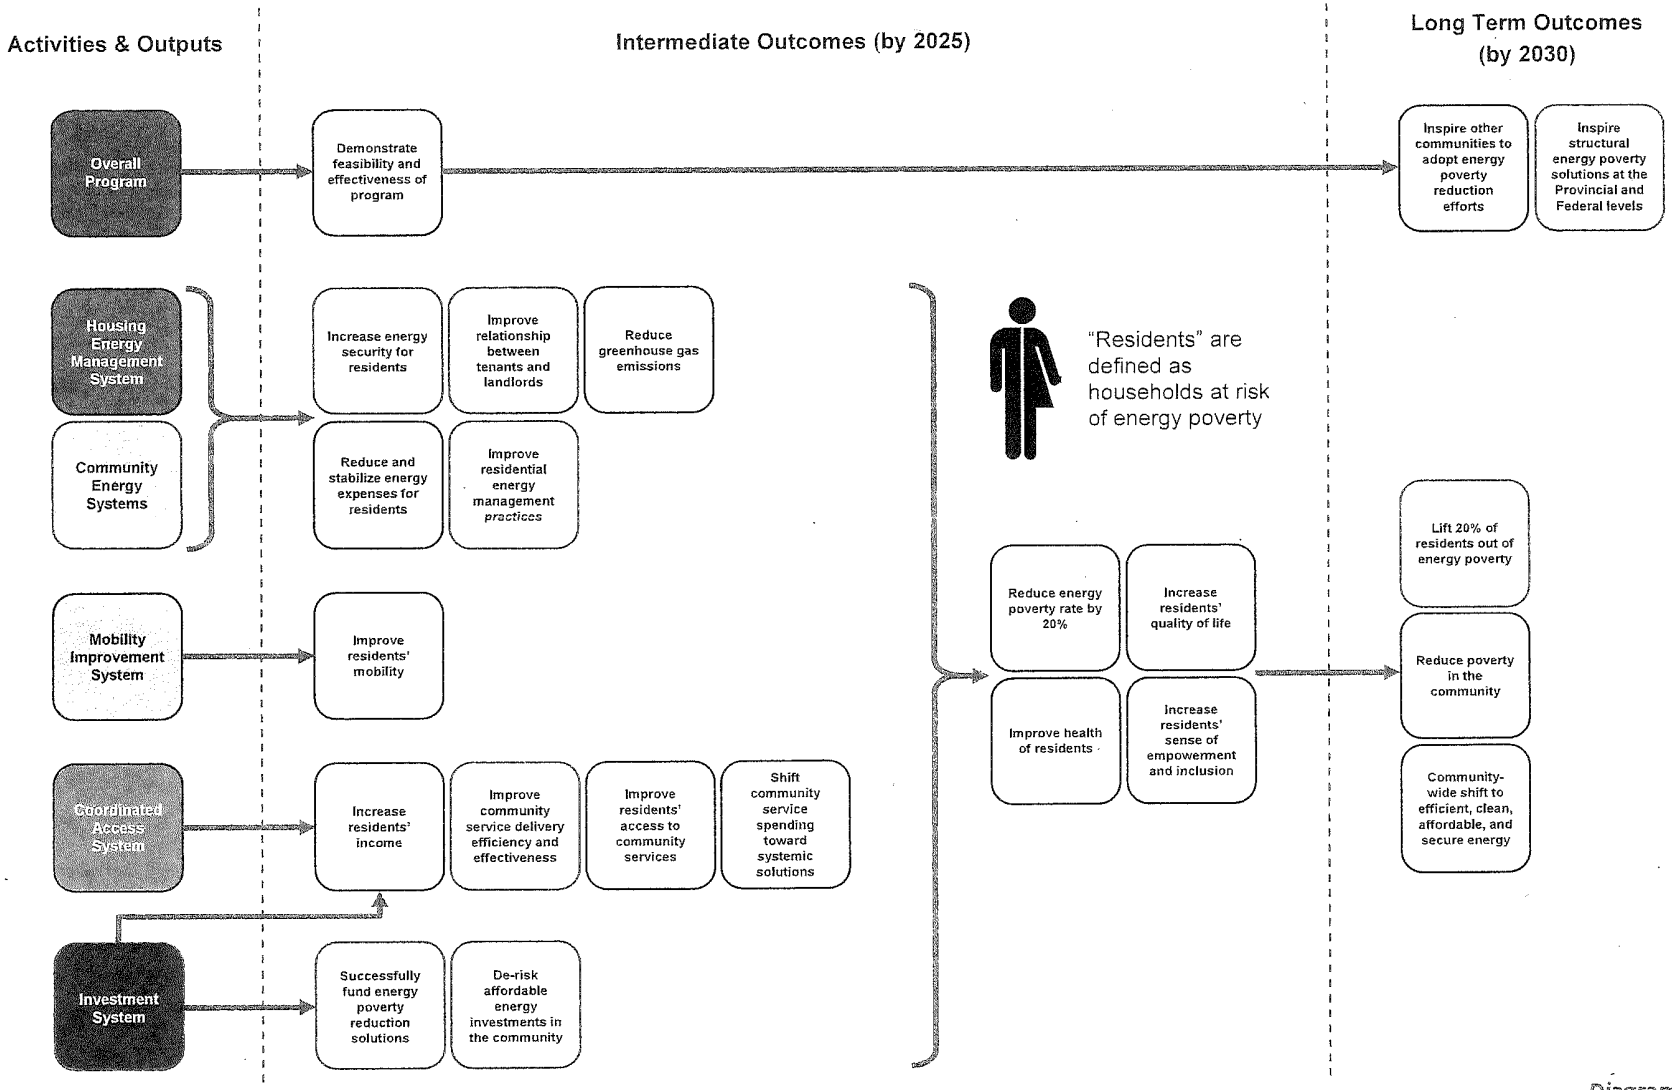

Diagram 2.1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

PROGRAM OUTCOMES AND INDICATORS

The program activities and outputs described in the preceding section are expected to result in a set of 22 intermediate and long-term outcomes that benefit the program clients, program stakeholders, the community as a whole, the environment, and ultimately communities beyond Bridgewater. Diagram 2.1 summarizes the Energy Poverty Reduction Program outcomes logic model. Outcomes displayed in the "intermediate outcome" section of the Diagram 2.1 will be demonstrated by 2025. While the benefits of these outcomes will continue to accrue past the Smart Cities Challenge program an additional set of 5 long-term outcomes are displayed in the final section of the chart, indicating our community's continued benefits from the program.

Indicators chosen for each outcome are meaningful, measurable and monitorable via data collected through the program itself, through regular community-wide surveys or from Statistics Canada census information.

Program Outcome Indicators and Associated Measurement Methodologies, Sources, and Tracking Systems

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Reduced poverty & improved wellbeing	1. Reduce energy poverty rate	Percent of households living in energy poverty	2018-19	38.5% (1,613 of 4,194)	2024-25	30.6% (1,362 of 4,452) = 20% rate reduction	Percent of households who self-report spending more than 10% of after-tax income on energy for the home and transportation and currently experiencing energy poverty. Measured through bi-annual community-wide survey. Percentages are based on projected future household growth as calculated in the Community Energy Investment Plan, with a basis in the 2016 Census.	Bi-annual community-wide Housing, Energy, and Transportation survey, to be conducted in 2028-29. Data stored on municipal platforms.	Overall Program
					2029-30	14.4% (660 of 4,577) = 62% rate reduction			Overall Program
	2. Reduce poverty	Percent of households living in core housing need	2016-17	27.9% (1,135 of 4,075)	2026-27	Decrease from baseline	Percent of households living in core housing need. A household is said to be in 'core housing need' if its housing falls below at least one of the adequacy, affordability or suitability standards and it would have to spend 30% or more of its total before-tax income to pay the median rent of alternative local housing that is acceptable (meets all three housing standards).	Census data (Statistics Canada). Target year will use 2026 Census.	Overall Program
	3. Improve health of residents	Amount of time program clients are able to meet their thermal comfort needs at home	Property intake year	Average property intake value	2024-25	Increase from baseline	Number of days per year that homes inhabited by program clients are sufficiently heated or cooled to a minimum level necessary for physical wellbeing. Subtracts the number of days that the temperature in main living area drops below 16 degrees C (threshold for respiratory illness) and 12 degrees C (threshold for cardiovascular illness), or above 27 degrees C (threshold for heat related illness) for a sustained period while occupants are home. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home temperature data. Data stored on municipal platforms.	Housing Energy Management System

Page 852 of 1849

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Reduced poverty & improved wellbeing	3. Improve health of residents	Thermal comfort of program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Overall thermal satisfaction over the past year, based on a scale from 1 (very dissatisfied) to 10 (very satisfied). Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Energy poverty-correlated population health index	2020-21	To be determined	2024-25	Improvement from baseline	Customized index of population health indicators to be designed and monitored by the Nova Scotia Health Authority using deidentified health system data. See letter of support.	Information to be collected and analysed by Nova Scotia Health Authority.	Coordinated Access System
	4. Increase residents' quality of life	Satisfaction of life in general for program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Satisfaction of life in general on a scale from 1 (very dissatisfied) to 10 (very satisfied). Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
	5. Increase residents' sense of empowerment and inclusion	Frequency of social contact for program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Percentage of time in the past year that the client reports contact 'once a week or more' with relatives and/or friends. Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Sense of belonging for program clients	Client intake year	Average client intake score	2024-25	Increase from baseline	Sense of belonging to the local community on a scale from 1 (very weak) to 10 (very strong). Self-reported assessment by client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
	6. Increase energy security for residents	Amount of time program clients are able to meet their home energy needs	Property intake year	Average property intake value	2024-25	Increase from baseline	Number of days per year that homes inhabited by program clients are sufficiently powered, heated, or cooled to a minimum level necessary for physical and mental wellbeing. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system issues alert on days that the home is unpowered or minimal thermal comfort levels are not met. Data stored on municipal platforms.	Housing Energy Management System

PERFORMANCE MEASUREMENT

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Better Housing	7. Reduce and stabilize energy expenses for residents	Spending on shelter by program clients	Client intake year	Average client intake value	2024-25	Decrease from baseline	Total annual spending on shelter by program clients (as applicable: rent, mortgage, insurance, property tax, maintenance, utilities, and energy contracts). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Affordability of housing energy costs	2018-19	37.4%	2024-25	Decrease from baseline	Percent of households who self-report having difficulty affording their home energy costs. Measured through bi-annual community-wide survey. Percentages are based on projected future household growth as calculated in the Community Energy Investment Plan, with a basis in the 2016 Census.	Bi-annual community-wide Housing, Energy, and Transportation Survey, to be conducted in 2024-25. Data stored on municipal platforms.	Overall Program
		Cost of home energy for participating properties	Property intake year	Average property intake value	2024-25	Decrease from baseline	Annual cost of all energy types consumed by homes inhabited by program clients, adjusted for annual climatic variability (heating degree days). Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home energy consumption and cost data. Data stored on municipal platforms.	Housing Energy Management System
	8. Improve relationship between tenants and landlords	Level of trust between tenants and landlords - tenant perspective	Client intake year	Average . client intake value	2024-25	Increase from baseline	Perception of trust in the landlord based on a scaled rating system on a scale from 1 (very low level of trust) to 10 (very high level of trust). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Level of trust between tenants and landlords - landlord perspective	Property intake year	Average property intake value	2024-25	Increase from baseline	Perception of trust in the tenant(s) based on a scaled rating system on a scale from 1 (very low level of trust) to 10 (very high level of trust). Self-reported assessment from client property owners or their property managers. Performance measured through change from baseline, pooled by property cohort (intake year).	Property owner survey facilitated by Technical Navigator. Initial intake, followed by periodic updates. Data stored on municipal platforms.	Housing Energy Management System
	9. Improve residential energy management practices	Cost savings resulting from energy management practices for participating properties	Property intake year	Average property intake value	2024-25	Increase from baseline	Total annual cost savings as compared to baseline energy consumption resulting directly from energy management practices (manual + automated) as calculated by home energy monitoring & control system. Accompanied by a property owner & tenant survey on energy conservation practices that is used to illustrate / educate opportunities for improved energy management. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home energy savings data. Property owner survey & tenant facilitated by Technical Navigator. Initial intake, followed by periodic updates. Data stored on municipal platforms.	Housing Energy Management System

PERFORMANCE MEASUREMENT

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Increased Mobility	10. Improve residents' mobility	Community-wide transit ridership	2018-19	27,000 annual riders	2024-25	43,000 annual riders	Daily average transit ridership. Includes all passenger types.	Ridership counted hourly by bus drivers. Data stored on municipal platforms.	Mobility Improvement System (MIS)
		Mobility self-assessment rating by program clients	Client intake year	Average client intake value		Increase from baseline	Ease of mobility based on a scale from 1 (very low mobility) to 10 (very high mobility). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
		Affordability of transportation energy costs	2018-19	25.5%	2024-25	Decrease from baseline	Percent of households who self-report having difficulty affording their transportation energy needs. Measured through bi-annual community-wide survey. Percentages are based on projected future household growth as calculated in the Community Energy Investment Plan, with a basis in the 2016 Census.	Bi-annual community-wide Housing, Energy, and Transportation Survey, to be conducted in 2024-25. Data stored on municipal platforms.	Overall Program
More effective community services	11. Improve residents' access to community services	Level of satisfaction with access to community services for program clients	Client intake year	Average client intake value	2024-25	Increase from baseline	Satisfaction with access to community services based on a scaled rating system on a scale from 1 (very dissatisfied) to 10 (very satisfied). Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
	12. Improve community service delivery efficiency and effectiveness	Self-assessment rating by Coordinated Access System partners	2020-21	To be determined	2024-25	Increase from baseline	Self-assessment rating using Coordinated Access System (CAS) Scorecard Guide which is a 23 question self-assessment tool to assist communities to take a snapshot local progress towards a quality Coordinated Access System.	Annual survey of coordinated access system partners facilitated by Household Navigator. Data stored on Coordinated Access System service provider server.	Coordinated Access System
	13. Shift community service spending toward systemic solutions	Percent of resources spent making emergency energy payments on behalf of clients, compared to other areas of support	2020-21	To be determined	2024-25	Decrease from baseline	Percent of annual dollars spent making emergency energy payments on behalf of clients, compared to other areas of support, for all service organizations that provide emergency energy funding for program clients.	Annual survey of coordinated access system partners facilitated by Household Navigator. Data stored on Coordinated Access System service provider server.	Coordinated Access System

Table 2.10

PERFORMANCE MEASUREMENT

Outcome Category		Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Increased economic access & participation	14. Increase residents' income	Earnings from participation in energy systems by program clients	2020-21	To be determined	2024-25	Increase from baseline	Total annual dividends and other cashflow paid out to self-identified program clients from local energy investments.	Annual report on community investors produced by Financial Investment Vehicle. Data *stored* on Financial Investment Vehicle platform.	System
	15. Increase residents' participation in the green economy	Earnings from employment in the clean tech sector by program clients	Client intake year	Average client intake value	2024-25	Increase from baseline	Annual earnings from employment in the clean tech sector. Self-reported assessment from client households. Performance measured through change from baseline, pooled by client cohort (intake year).	Client wellbeing survey facilitated by Household Navigator. Initial intake, followed by periodic updates. Data stored on HIFIS.	Coordinated Access System
Achieved Climate Targets	16. Reduce greenhouse gas emissions	Greenhouse gas emissions from participating homes	Property intake year	Average property intake value	2024-25	Increase from baseline	Number of days per year that homes inhabited by program clients are sufficiently powered, heated, or cooled to a minimum level necessary for physical and mental wellbeing. Performance measured through change from baseline, pooled by property cohort (intake year).	Home energy monitoring system reports aggregated home energy consumption and emissions data. Data stored on municipal platforms.	Housing Energy Management System
	17. Community-wide shift to efficient, clean, affordable, and secure energy	Achieve the goals of the Community Energy Investment Plan	2016-17	2016 performance values	2024-25	Decrease from baseline	Key performance metrics articulated in the plan include: (1) community-wide energy consumption, (2) community-wide greenhouse gas emissions, (3) community-wide spending on energy, (4) community-wide investment in energy improvements, and (5) job creation resulting from energy investments. Implementation of the Energy Poverty Reduction Program will contribute strongly toward achieving these outcomes.	Annual indicator update by Planning & Recreation Department staff, and update of CEIP model and targets every 5 years. Data stored on municipal platforms.	Overall Program
Investment in communities	18. De-risk affordable energy investments in the community	Investment leverage ratio of capital improvement projects funded by the program	2020-21	To be determined	2024-25	To be determined	The ratio of all public instruments versus private sector investment in the program's capital projects (housing, transportation, and community energy systems). As both the costs of the public instruments as well as the energy investments occur over time, the present value of the costs and investments are used to calculate the investment leverage ratio. It is currently unclear what investment leverage ratio would be considered ideal for the program. This metric will be investigated during the program design stage.	Annual indicator update by Investment Navigator. Data stored on municipal platforms.	Investment System

Table 2.10

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

PERFORMANCE MEASUREMENT

Outcome Category	Outcome	Performance Indicator	Baseline		Target		Methodology	Source	Tracking Program / System
			Year	Value	Year	Year			
Investment in communities	18. De-risk affordable energy investments in the community	Carbon abatement cost of capital improvement projects funded by the program	2020-21 Property intake year	To be determined	2024-25	Decrease from baseline	The present value of the incremental costs of the energy project investments divided by the greenhouse gas emission reduction potential. Reported as dollars per tonne of carbon abated. Climate change mitigation indicator. This metric will be investigated during the program design stage.	Annual indicator update by Investment Navigator. Data stored on municipal platforms.	Investment System
	19. Successfully fund energy poverty reduction solutions	Funding and investments toward the program	2018-19	$250,000 Smart Cities Challenge finalist grant	2024-25	$45.7 million	Total funding and investments in energy poverty reduction program, including local investments and stacked funding (e.g. grants, rebates, etc.).	Annual indicator update by Investment Navigator. Data stored on municipal platforms.	Investment System
	20. Demonstrate feasibility and effectiveness of program	Achievement of program outcomes	2018-19	No outcomes achieved	2024-25	Phase 3 outcomes achieved, positive evaluation by partners and participants	Achievement of program outcomes, and evaluation by partners and participants. Measured though comprehensive evaluation process for program partners and participants.	Annual indicator update by program managers. Data stored on municipal platforms.	Overall Program
Demonstration of impact	21. Inspire structural energy poverty solutions at the Provincial and Federal levels	Government policies or programs have been influenced by the Energy Poverty Reduction Program model	2018-19	No reported instances yet	2029-30	Increase from baseline	Number of senior government articles of legislation, policies, or programs that have been definitively influenced by the Bridgewater program. Measured through information sharing with Provincial and Federal governments.	Annual indicator update by program managers. Data stored on municipal platforms.	Overall Program
	22. Inspire other communities to adopt energy poverty reduction efforts	Other communities in Canada have been influenced by the Energy Poverty Reduction Program model	2018-19	No reported instances yet	2029-30	Increase from baseline	Number of other communities in Canada that attribute all or part of their energy poverty reduction efforts to the Bridgewater program. Measured through information sharing with other communities.	Annual indicator update by program managers.. Data stored on municipal platforms.	Overall Program

Table 2.10

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

GOVERNANCE STRUCTURE

As a municipal service, the Energy Poverty Reduction Program falls under Bridgewater Town Council's oversight, and under management of the Chief Administrative Officer (CAO). Final design and implementation of the program will be the responsibility of the Community Development Department, with a number of related functions taking place through other departments. The following elements are proposed within the governance and management structure:

- **Energy Poverty Reduction Program Steering Committee:** a formal Committee of Council that will provide advice to Council and staff on the design and implementation of the program. The Steering Committee will assist with maintaining community partnerships, and participate in program evaluation and quality review. It will participate, as appropriate, in client dispute resolution through an ombudsperson, and meet periodically with a Client Advisory Circle to receive client feedback. It is envisioned as a 6-10 member group, consisting of key program partners from the local community sector as well as regional organizations with expertise in energy and housing, such as Efficiency Nova Scotia. A member of Town Council will also sit on the Committee. Committee members do not receive compensation for their role through the Town, though some members may be paid staff from other organizations. The Committee will be resourced and supported by Town staff who coordinate and implement the program. A Terms of Reference for the Committee will be developed, and the Committee positions will be filled as one of the earliest activities in Phase 1.

> Collaborating as a group to help solve problems is often much more effective than organizations trying to do it on our own.
> – COMMUNITY SERVICE ORGANIZATION

- **Ombudsperson:** clients whose complaints about the program are not able to be resolved by program management may escalate their complaint to the Ombudsperson. This person is charged with representing the interests of program clients by investigating and addressing complaints. The Ombudsperson is recommended by the Steering Committee, and will be an external, independent expert with knowledge of the program. They will receive compensation for their work on a per diem basis. A role description for the Ombudsperson will be developed during Phase 1.

- **Client Advisory Circle:** prospective, current, and past clients of the program are recruited to participate in this advisory structure to provide periodic feedback to the Steering Committee and the program management team. The Client Advisory Circle is consulted on matters related to program design and implementation, quality, accessibility, affordability, fairness, and overall impact of the program. As the program clients include both households-at-risk as well as property owners, the Client Advisory Circle will represent both. Client Advisory Circle members receive a per diem to cover their participation, to reduce the risk that financial barriers will prevent effective participation. A Terms of Reference for the Client Advisory Circle will be developed as one of the earliest activities in Phase 1.

- **Technical Advisory Circle:** an ad-hoc working group that supports the program management team in the design and implementation of the program. The Technical Advisory Circle provides voluntary, independent, expert advice and project support to Town staff. A Terms of Reference for the Technical Advisory Circle will be developed as one of the earliest activities in Phase 1.

- **Program Coordinator:** the Community Development Department will put its staff

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

in charge of the overall coordination of the program. The Energy Poverty Reduction Program Coordinator reports to Senior Manager and through the CAO to Town Council. This staff is also the main resource to the Steering Committee. As this coordination role is critical to all components of the program, the job description(s) for staff will be developed and/or updated, and any necessary hiring completed before Phase 1 begins.

- **Municipal Program Management:** day-to-day management of the 4 linked municipal services (the Housing Energy Management System, Community Energy Systems, the Mobility Improvement System, and the Investment System) will fall to municipal staff. Activities within each program will be a combination of staff effort and procured third-party services. Technical Navigators and an Investment Navigator provide services both to program clients and to program managers, while an Information Systems Specialist provides data management services within the program. Quality control and evaluation is carried out by staff, in partnership with the Steering Committee. Full descriptions of these positions will be developed before Phase 1 begins, and any necessary hiring will commence as one of the earliest activities of Phase 1.

- **The Coordinated Access System** will be managed by a third-party service provider with its own management and governance systems. Household Navigators are employed by the service provider. A partnership or service agreement defines the relationship between the Town and the external organization, as well as the responsibilities of both parties. See the **Performance Measurement Chapter** for a more detailed description of the service procurement process and anticipated timelines.

- **The Financial Investment Vehicle,** a sub-component of the Investment System, will be managed by a third-party service provider with its own management and governance systems. A partnership or service agreement defines the relationship between the Town and the external organization, as well as the responsibilities of both parties.

  See the **Performance Measurement chapter** for a more detailed description of the service procurement process and anticipated timelines.

The relationship between most of the governance and management structures described above are illustrated in the following in Diagram 3.1.

A Bridgewater resident views an exhibit on energy poverty at a Smart Cities Challenge Open House.

> It would help so that we wouldn't have to scurry around, one call request for assistance requires 8 other calls; if we would just network it would make it easier.
>
> – COMMUNITY SERVICE ORGANIZATION

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Program Governance and Management

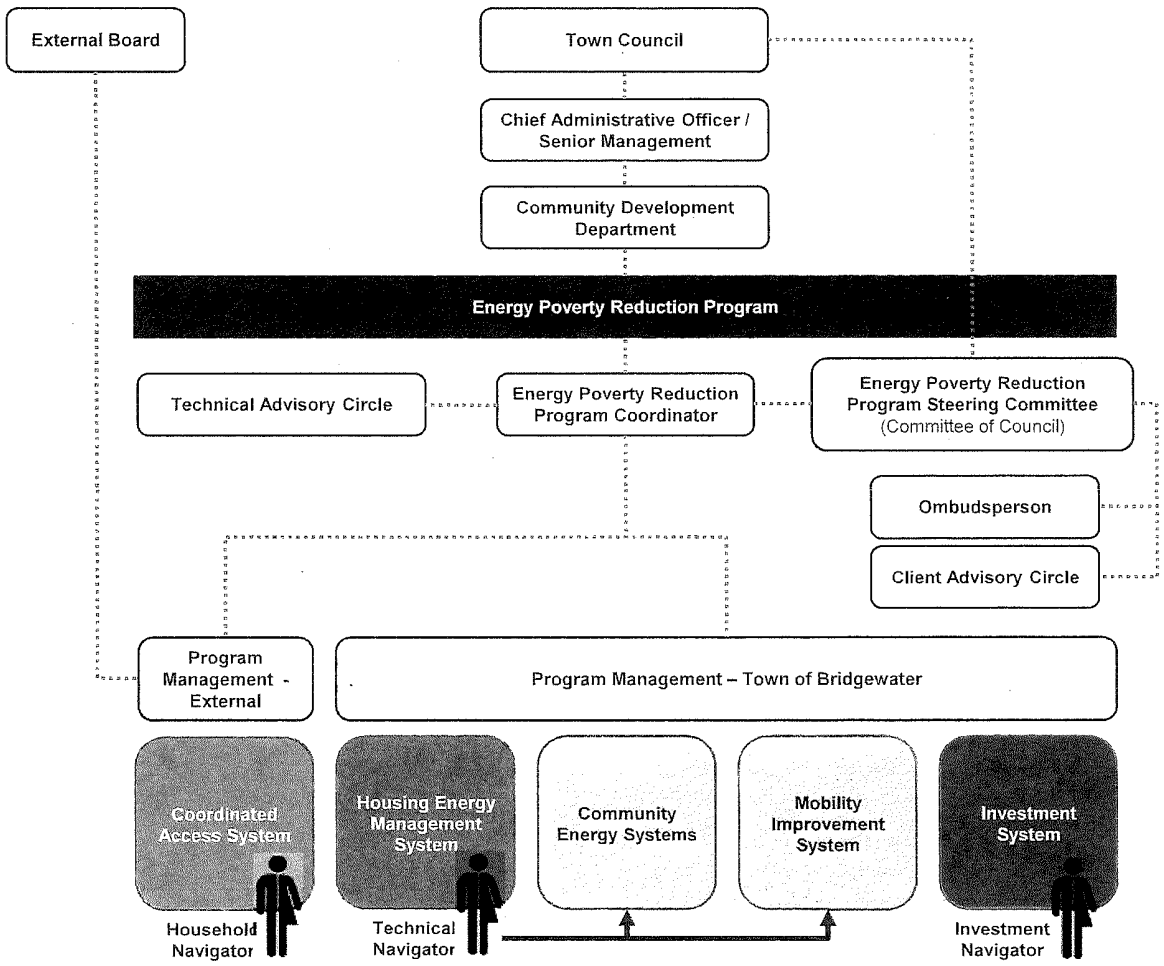

Diagram 3.1

EVALUATION, RISK MANAGEMENT, AND QUALITY CONTROL

Program staff will lead ongoing monitoring and reporting of program outputs as well as outcome indicators throughout all phases of the program. Monitoring and reporting responsibilities are divided by program, as defined in the **Performance Measurement chapter.** Performance measurement for activities that fall under "overall program management" are the primary responsibility of the Energy Poverty Reduction Program Coordinator, with the support of the Steering Committee. Annual reports will be generated for all program services, and shared widely with program stakeholders including Bridgewater Town Council. In its reports, staff will ensure that all identifying personal and business information is reported in aggregate unless express permission is given to share the information publicly.

See the **Engagement chapter** for information on how the program will maintain evaluation engagement with all its stakeholders.

All structures and members within the program governance and management system also have defined roles to play in the program's risk management and quality control processes. While risk management and quality control oversight ultimately rests with Bridgewater Town Council

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

and the Chief Administrative Officer, the lead role for ongoing risk management and quality control activities will be delegated to program staff throughout all phases of the program. The risk management framework and quality control processes, including program governance risks, are described in the **Project Management chapter.** These activities will involve all other structures and members on a periodic basis, with additional involvement as needed. Key among these will be the Energy Poverty Reduction Program Steering Committee, which will be kept informed of emerging risk and quality control issues, and consulted on mitigation strategies.

PARTNER COMMITMENTS

We are pleased to report that a large and diverse group of program partners and supportive organizations have pledged their support for Bridgewater's proposed program. Partner commitments are described below, grouped by program service:

HOUSING ENERGY MANAGEMENT SYSTEM AND COMMUNITY ENERGY SYSTEMS

- **Green Power Labs** – Committed to the development and integration of the Energy Management Information System, engineering and integration of the real time operations (RTO) system, general technology development, and support and operations in the Town of Bridgewater up to 2030.
- **Efficiency Nova Scotia** - Committed to partnering on detailed program design and delivery of the Housing Energy Management System. This includes the provision of energy efficiency services and financial incentives for retrofits and new construction. Advisory support is provided through the Energy and Financing Working Group.
- **TownSuite Municipal Software** – Expressed interest in exploring the expansion of existing municipal software with the addition of an energy management information system (EMIS) module, with the eventual expansion into real time operations (RTO) functionality. Supportive of exploring the possibility of the enterprise resource planning (ERP) system backbone to support the program and develop the Client Mobility Application module.
- **Clean Foundation** - Committed to the provision of expertise, service delivery and design for the residential energy efficiency retrofit program. Clean Foundation will share data, and related financial and technical learnings of a recently piloted Net Zero retrofit program in Bridgewater.
- **Nova Scotia Power** - Nova Scotia Power will support access to the AMI and the Green Button initiative, offer financing for heat pumps for home retrofits, and provide support for connected technology solutions and applications, as well as expertise for charging stations for electric public transport.
- **St. Mary's University – Faculty of Science** – Committed to the provision of significant contributions in collaboration with Green Power Labs towards Big Data Management, Data Science, Machine Learning, and other aspects of Artificial Intelligence of the project.
- **Dalhousie University – Faculty of Computer Science** - The Smart City Research initiative of Dalhousie University is committed to partnering with Bridgewater to implement the Energy Poverty Reduction Program by providing advisory support. Advisory support is provided through the Energy and Financing Working Group.
- **Nova Scotia Department of Energy and Mines** – Committed partner on the implementation of the Community Energy Investment Plan and the Energy Poverty Reduction Program. Advisory support is provided through the Energy and Financing Working Group.
- **Affordable Energy Coalition** – Continued efforts to influence provincial policy and programs to further support energy poverty reduction efforts and inspire other communities to adopt Bridgewater's model. Further aid in knowledge sharing on how to best work with landlords in implementing energy retrofits.
- **Housing Nova Scotia** – Committed to exploring a partnership for upgrade

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

referrals and continuing to provide up to date information on programs, funding, and housing stock. In addition, exploring a relationship to monitor and reduce the energy consumption of public buildings.

- **Ecology Action Center** – Committed to providing program education, advocacy, and engaging landlords in the proposed retrofit program.
- **Quality Urban Energy System of Tomorrow (QUEST)** – Prepared to disseminate program information to other municipalities through a Municipal Energy Learning Group and the QUEST NS Buildings Working Group. As one of five regional advisors for the Partners for Climate Protection program, QUEST will share replicable aspects of this program widely within the country. Committed to providing advisory support through the Energy and Financing Working Group.

MOBILITY IMPROVEMENT SYSTEM:

- **Nova Scotia Community Transportation Network** – Committed to promoting Bridgewater's transportation model to other rural communities in Nova Scotia and strengthening the network of relationships between non-traditional for-profit and non-profit community-based transportation providers.
- **Bridgewater Active Transportation Advisory Committee** – Committed to advising the town in its efforts to become an active transportation-supportive community, including putting an AT lens on town infrastructure, programs, policy and projects, and increasing partnerships promoting active transportation.

INVESTMENT SYSTEM:

- **New Dawn Enterprises** – Committed to potentially partnering with the Town of Bridgewater to establish a centralized CEDIF platform if it is selected as a community-investment tool. Advisory support is provided through the Energy and Financing Working Group.
- **Energy Services Association of Canada (ESAC)** – Members are committed to engaging in a competitive tendering process to demonstrate innovative ways to work with and be an integral part of Bridgewater's Smart City vision.

COORDINATED ACCESS SYSTEM:

- **Freeman House in association with Family Services of Western Nova Scotia** – Committed to partnering with the Town to administer the Coordinated Access System, provide guidance and support for system setup, on-going operations, communications, and in-kind support through staffing.
- **Nova Scotia Health Authority** – Committed to championing work within their networks and among community members through a Coordinated Access System, working with experts to develop an energy poverty index using health system data, and facilitating collaboration with other NSHA programs.
- **Nova Scotia Community College, Lunenburg Campus** - Committed to providing education and training opportunities through the Work Integrated Learning Programs, partnering with their Women Unlimited program to help showcase women in non-traditional trades and technology workplaces, integrating into a Coordinated Access System, and ultimately exploring the creation of new programming opportunities in the areas around Green Energy and Technologies.
- **South Shore Housing Action Coalition** - Prepared to support the program in an advisory capacity, engage its broad spectrum of members, and to support and facilitate the sharing of information about the project.
- **Service partners** committed to continued project engagement for the planning of a measurable, manageable and effective Coordinated Access System, and acting as referral and outreach agents, in the promotion, enhancing, and navigation of community resources through the system. These partners include: **Society St. Vincent de Paul; The Ark and Support Services Group;**

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

Second Story Women's Center; Lunenburg County YMCA; United Way Lunenburg County; Salvation Army Bridgewater, N.S; South Shore Family Resource Center; Big Brothers, Big Sisters of South Shore; Be the Peace Institute; Bridgewater and Area Lions Club; Bridgewater Law Office (Nova Scotia Legal Aid); Nova Scotia Works; Bridgewater Food Bank; Family Support Center; Souls Harbour Rescue Mission, Bridgewater; SchoolsPlus; Small World Learning Center.

OVERALL PROGRAM SUPPORT

- **Halifax Regional Municipality –** Committed to sharing information on climate change related initiatives.
- **Government of Nova Scotia –** Committed to supporting the Town as a climate change leader.

Letters of support confirming all these commitments are provided in the Appendix. Additional letters of support that are confidential in nature because they contain sensitive market information are provided in the Confidential Annex.

DATA AND INFORMATION GOVERNANCE

Data and related infrastructure, along with the technologies and services for the Energy Poverty Reduction Program are key to the success, transferability and replicability of the program. Data governance must ensure that digital solutions both improve the liveability and wellbeing of the households-at-risk of energy poverty, and also meet democratic, privacy, and quality standards appropriate for a project of this scale.

At the core of municipal data governance lies the question of what communities can do in order to manage data in the best interest of their community members and the stakeholders at large without jeopardising privacy and security, and the potential business opportunities that lie within municipal data sets. This eventually leads to a fundamentally new form of public-private partnerships with data as the instrument. In developing this Energy Poverty Reduction Program, we have begun to develop a data governance policy which will need further refinement in the early stages of the program development. This needs to be undertaken in conjunction with the technology and data platform development process. This is discussed in further detail in the **Data and Privacy chapter.**

To develop a strong municipal data governance system for our Energy Poverty Reduction Program, the Town will be carefully considering the following questions and working with our community partners and participants to determine how we will manage the great deal of data and information sharing that is inherent in a smart cities approach.

- What strategies and approaches do communities need to follow to enable third-parties to share their data with the Town of Bridgewater?
- How can the Town remain the decision maker about data usage in public-private partnerships or in data-driven projects that impact the common good?
- What are the lines of decision making and how can the Town create transparent systems that show the existing trade-offs between public and private interests?
- What resources and skills are needed in Bridgewater to moderate data-related decision making?
- How can communities successfully initiate and steer pilot projects on municipal data?
- How do communities ensure ownership of the data in public contracts?
- What data should be provided as open data by the Town and how can communities arrive at a decision about this?
- How can communities embed their policy requirements in municipal data platforms?

The **Data and Privacy chapter** provides preliminary responses to the above questions. Additional work needs to be done during the detailed program design process to fully develop the Energy Poverty Reduction Program data governance framework. Concerns about data are detailed in the risk management section in the **Project Management chapter.**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

COMMITMENT TO INNOVATION AND ENERGY POVERTY REDUCTION

Over the past decade, the Town has been an active partner in multi-sectoral initiatives around topics as diverse and complex as food security, affordable housing, youth retention, health services planning, seniors safety, transportation, gender-based violence prevention, alcohol harm reduction, economic development, and a variety of community development initiatives.

The implementation of our ground-breaking Community Energy Investment Plan (2018) remains Town Council's key area of focus, and holds a priority status in the Town's Economic Development Action Plan (2018). The Town has publicly affirmed its commitment to implementing a broad spectrum approach to energy transition and energy poverty alleviation, including the new and innovative solutions that participation in the Smart Cities Challenge has helped us to identify and design.

PROJECT MANAGEMENT CAPABILITY

The Town of Bridgewater has worked hard to expand its highly qualified staff team to the point where it can confidently manage the detailed design and set up of the Energy Poverty Reduction Program. Initial lead staff on this file will include:

- Tammy (Crowder) Wilson, CAO. Tammy has over 20 years' experience in municipal government. She has worked on energy projects including wind energy and anaerobic digestion projects under the Nova Scotia's COMFIT program. She has also facilitated a partnership with the private sector to see landfill material turned into a marketable commodity and increase landfill diversion. Tammy has led the regionalization of some municipal services along the south shore, including participating in the development of several municipal corporations.
- Jessica McDonald, Director of Community Development. Jessica spent over a decade coordinating multi-sectoral environmental policy initiatives and programs for the Province of Nova Scotia. In Bridgewater, her accomplishments include stewarding the design and implementation of the Town's ambitious Pijinuiskaq Park and King Street streetscape enhancements, and overseeing the development of its first fixed route public transit service.
- Leon de Vreede, Sustainability Planner. Leon has managed the Town's sustainability program for over 10 years. Specializing in innovative planning, program design, and community engagement practices, Leon's work has been recognized by the Province of Nova Scotia through an inaugural Clean Climate Leader award in 2015, and by the Federation of Canadian Municipalities through his designation as a PCP Local Climate Change Hero in 2016. Leon will function as Program Coordinator for the proposed program.
- Greg Goubko, Energy Finance & Development Coordinator. Greg has spent the past 4 years working at the Toronto Renewable Energy Co-op/Tapestry Community Capital as the Community Investment Manager. He has recently joined the Town of Bridgewater to help with the implementation of the Community Energy Investment Plan and the Smart Cities Challenge project. He brings a wealth of knowledge related to community financing and local investment.
- Myles Cornish, On-Site Energy Manager. Myles is a Professional Engineer, working for Bridgewater under contract for Efficiency Nova Scotia. Aided by his extensive network throughout the Efficiency Nova Scotia organization as well as to external trade partners, Myles brings the core engineering expertise to the table that is needed to design and implement the infrastructure solutions proposed by the program.

Project management decisions will be made by the Director of Community Development and the CAO, and key decisions that affect town services (e.g. selection of technology partners, and key program design considerations) will be brought to Council for direction. The Steering Committee

Processed under the provisions of the Access to Information Act/Révisé en vertu de la Loi sur l'accès à l'information

will review all project documentation (including staff-generated reports, RFPs and Terms of Reference, and consultant and legal reports) and provide feedback and guidance to staff throughout the process.

PROGRAM DEPLOYMENT

Lifting our residents out of energy poverty is an ambitious outcome outcome, which will many activities and deliverables along the way. A detailed discussion of the program activities and outputs (deliverables) are contained in the **Performance Management chapter** and includes a comprehensive list of indicators to help us measure and monitor our progress. Resource assessment for each element of the Energy Poverty Reduction Program is also discussed in that chapter. This includes details on program design, staffing, technology, partner and stakeholder engagement, procurement processes and needs, legislative and regulatory approvals, database and technology needs, administration, communications and evaluation. Costs associated with each program area, including the proposed use of the Finalist Grant, is provided in the **Financial chapter,** Tables 9.1 through 9.14. Strategies for engagement with partners, stakeholders, and target clients for the program are discussed in the **Engagement chapter.** This includes strategies for ensuring that our program is designed to be meaningful, fair and impactful for the broad range of residents who find themselves struggling to pay their energy bills in the face of all the other household priorities and hurdles.

The Energy Poverty Reduction Program consists of a set of 5 interconnected systems that will be deployed in 4 phases; each building off each other with some overlap in the early phases.

1. **Prototype Program Setup -** This phase includes partnership development; detailed service and technical design; service procurement; client consultation; a comprehensive Privacy Impact Assessment (PIA) on the detailed program design and an overarching privacy policy.

2. **Prototype Program Testing & Refinement -** This phase involves a gradual ramping up of client intake; continuing design and implementation of services and technologies; and monitoring and evaluation of results. Program outcomes become measurable by end of this phase.

3. **Final Program Activation -** This phase requires the finalization of program service design and technical components; extensive documentation of program outcomes; and the development of learning materials for other communities and senior governments. The completion of the Final Program Activation phase marks the end of Smart Cities Challenge contribution agreement.

4. **Program Maturity -** This phase includes ongoing client intake; program evaluation and improvement as well as the integration of new and emerging community energy technologies and solutions.

Program Deployment Phases and Households Served by Program Year

Program Year	2020-21	2021-22	2022-23	2023-24	2024-25	Total
Phase	1: Prototype Program Setup					
		2: Prototype Program Testing & Refinement				
				3: Final Program Activation		
						4.Program Maturity
Households Served	0	50	75	100	125	750 over 5 years
Relationship to Smart Cities Challenge (SCC)	Within SCC Program & Funding					After SCC

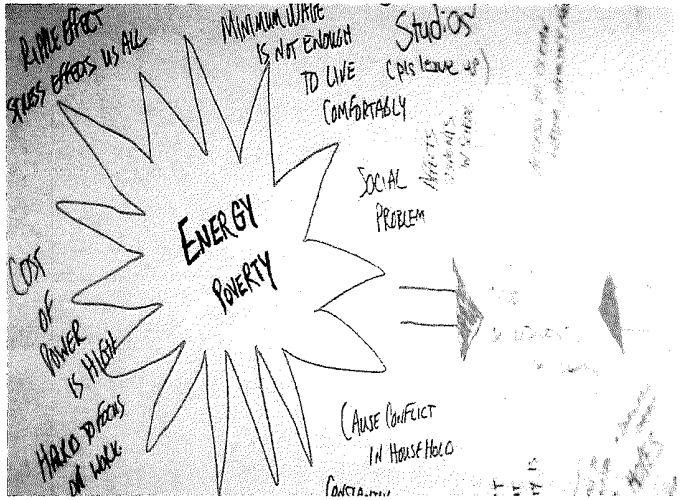
Table 4.1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

> When people are in a crisis, they need manageable steps to be able to navigate the system of services.
> – RESIDENT, TOWN OF BRIDGEWATER

Table 4.1 describes the timing of phases and the number of households served. As stated early on in the project overview, households-at-risk are less likely to also be the property owner. So the number of households served will account for both the inhabitants and the property owners of the properties they inhabit.

The extended period of prototyping, evaluation and improvement ranging from fiscal year 2021-22 to 2024-25 has been purposefully planned in recognition of the complexity of the program and the need for frequent review and adjustment of goals and solutions. This approach to prototyping is in line with smart cities approaches that revolve around continuous learning and feedback cycles using program metrics and client and partner evaluation.



This approach has also been selected to support a robust risk management process that will ensure program risks and challenges arising from program activities, outputs, and outcomes are mitigated in real time and that emerging risks are being identified before they create problems. In particular, 4 key program risks will be continuously assessed and mitigated through this phased deployment:

- Program uptake risk: uncertainty as to the willingness of households-at-risk and property owners to participate in the program
- Financial risk: uncertainty in program costs and sources of funding and investment
- Technical risk: uncertainty in database development timeframes and functionality
- Supply chain risk: uncertainty in the availability of skilled labour to complete the envisioned infrastructure improvements

The project risks and mitigation strategies are comprehensively discussed in the next section of this chapter.

Risk Management Framework

Project risks and their respective mitigation strategies related to all other chapters in this application are fully described in this section. As described in the **Performance Measurement chapter,** the Energy Poverty Reduction Program will measure the progress toward its outputs and outcomes through an iterative process of design, prototyping, and evaluation. This approach will ensure that program risks and challenges arising from program activities, outputs, and outcomes are being mitigated in real time. It also supports the program's governance, evaluation, and quality control needs.

Notes from a discussion at a Smart Cities Challenge workshop.

Connecting these elements is the program's risk management framework, which consists of the following components:

- an analysis of program risks
- a set of overarching risk management strategies
- a series of course correction checkpoints and risk mitigation options for the program

ANALYSIS OF PROGRAM RISKS

Table 4.2 identifies significant program risks based on the theme of specific chapters within this application, as well for the overall program. Risk probability and risk impact are both measured on a relative scale of 1 (low), 2 (moderate), and 3 (high).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Risk Assessment by Program

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Overall Program	Smart Cities Challenge grant not achieved	3	3	Lack of funding for program development. Program unlikely to be implemented as proposed, and/or over much longer timeframe.	Significant risk, not easily mitigated	Proposal evaluation by Jury
	Substantial economic downturn affects overall ability to secure financing & funding	1	3	Lack of program funding. Program may need to be implemented over much longer timeframe.	Significant but unlikely risk, partially mitigatable	Investment System
	Program fails to lift residents out of energy poverty, or affect systemic change as envisioned	2	3	Affects program targets, performance measures, and ability to meet outcomes.	Significant risk, partially mitigable	Overall Program Management
	Program is too complex for clients, partners, and service providers to navigate or maintain	2	2	Affects ability of clients/partners/service providers to navigate program structures and processes. Reduces client, partner, and service provider participation rate. Delays program implementation. Adds to program cost. Affects program targets, performance measures, and ability to meet outcomes.	Moderate risk, partially mitigatable	All program services
Performance Measurement	Performance indicators cannot be measured as expected	2	1	Affects performance measurement and outcomes monitoring.	Minor and mitigatable risk	All program services
	Actual energy poverty rate is different than currently understood (38.5%)	2	2	Affects program targets, performance measures, and ability to meet outcomes. May not be able to be measured accurately.	Moderate but mitigatable risk	Overall Program Management
Governance	There is insufficient capacity/interest by program partners to maintain effective program governance & evaluation	1	2	Program implementation responsibility rests too heavily on Town of Bridgewater. Community champions lacking. Reduced program uptake. Reduced program quality.	Moderate but unlikely risk	Overall Program Management
	Client or partner makes complaint that is unable to be resolved	2	2	Additional strain on program resources & management. May escalate into legal or regulatory action against program. Affects public perception of program.	Moderate but mitigatable risk	All program services and Ombudsperson
Project Management	Contractor & supply chain capacity is lower than anticipated	3	3	Delays program implementation. May affect program quality. Likely to increase program costs.	Significant risk, not easily mitigated	Housing Energy Management System, Community Energy Systems, and Mobility Improvement System
	Key service delivery partner defaults on contract or experiences loss in capacity to carry out responsibilities	1	3	Delays program implementation. May affect program quality. May increase program costs. May lead to client/partner dissatisfaction as a result of interrupted service.	Significant but unlikely risk, partially mitigatable	All program services
	Regulatory, cost, and project management uncertainty in deployment of development and financing structures	3	2	Program design cannot be finalized until development and financing structures are confirmed. Affects cost and project management assumptions, as well as procurement and partnership design. Creates overall program uncertainty. Lack of resolution within reasonable timeframe affects program targets, performance measures, and ability to meet outcomes.	Moderate risk, partially mitigatable	Investment System and Community Energy Systems

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Project Management	Challenges finding or retaining qualified staff to manage the program	1	2	May delay program implementation or affect program continuity. May affect program quality. May increase program costs. May lead to client/partner dissatisfaction as a result of interrupted service.	Moderate but unlikely risk	All program services
Technology	Legislative & regulatory barriers prevent deployment of community energy solutions or delay their deployment	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability and security goals not being met.	Moderate risk, partially mitigatable	Community Energy Systems
	Technical assessment/due diligence studies of community energy systems yield unfavorable results or take longer than anticipated	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability security goals not being met.	Moderate but mitigatable risk	Community Energy Systems
	Development of core data platform solutions is more technically complex, costly, or time-consuming than anticipated. Scope creep.	2	3	Delays program implementation. May affect program quality. Likely to increase program costs.	Significant risk, not easily mitigated	All program services
	Anticipated data platform partners not interested in participating	2	2	Delays program implementation. May affect program quality. Likely to increase program costs. May result in interoperability challenges.	Moderate risk, partially mitigatable	All program services
	Technological disruption causes dramatic change in cost or ability to implement planned technological solutions	1	2	Effects generally unknown - may enhance or hinder program implementation, including costs and ability to meet outcomes.	Moderate but unlikely risk	All program services
Data and Privacy	A data security breach occurs in one or more data platforms	1	3	May compromise client and partner data, including personal and corporate information. May result in program shutting down operations to address security breach. May erode trust in the program and affect the program's ability to attract clients and service providers, affecting program outcomes.	Significant but unlikely risk, partially mitigatable	All program services
	Program participants' concerns about privacy are not satisfied, leading to low uptake rates/negative publicity	1	2	May affect the program's ability to attract clients and service providers, affecting program outcomes.	Moderate but mitigatable risk	All program services and Ombudsperson
	Program partners are unable or unwilling to share all or part of anticipated data	2	2	May affect program's ability to track clients, partners, and outcomes indicators. May affect program quality.	Moderate risk, not easily mitigated	All program services
	A data platform experiences a service delivery problem or unexpected failure	1	3	May result in program shutting down operations temporarily. May erode trust in the program and affect the program's ability to attract clients and service providers, affecting program outcomes. May affect program quality. May increase program costs. May lead to client/partner dissatisfaction as a result of interrupted service.	Significant but unlikely risk, partially mitigatable	All program services
Engagement	Program delays or challenges result in negative publicity in community and beyond	1	2	May affect the program's ability to attract clients and service providers, affecting program outcomes.	Moderate but mitigatable risk	All program services

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Engagement	Program is ineffective at reaching clients who are most in need	2	2	Program outcomes not achieved. Energy poverty rate not reduced as quickly as anticipated. Negative publicity may affect the program's ability to attract clients and service providers, further affecting program outcomes.	Moderate risk, partially mitigatable	Housing Energy Management System and Coordinated Access System
	Program uptake (households-at-risk) is lower than anticipated	1	2	Program outcomes not achieved. Service contract thresholds not reached. Energy poverty rate not reduced as quickly as anticipated.	Moderate but unlikely risk	Coordinated Access System
	Program uptake (property owners) is lower than anticipated	2	3	Program outcomes not achieved. Service contract thresholds not reached. Energy poverty rate not reduced as quickly as anticipated.	Significant risk, not easily mitigated	Housing Energy Management System
	Program uptake in general is higher than anticipated	2	2	Additional strain on program resources and management. Dissatisfaction in community if waiting list grows.	Moderate but mitigatable risk	Housing Energy Management System and Coordinated Access System
Financial	Legislative & regulatory requirements are not met or delayed, including expectations around regulatory changes	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability and security goals not being met.	Moderate risk, partially mitigatable	All program services
	Major regulatory change causes disruption to program	1	2	Effects generally unknown - may enhance or hinder program implementation, including costs and ability to meet outcomes.	Moderate but unlikely risk	All program services
	Program costs are higher than anticipated. May arise from currency risk	2	3	May make housing, transportation, and community energy system improvements unattainable or only partially attainable. Increases demands on funding / financing. Delays program implementation. May affect program quality.	Significant risk, partially mitigable	All program services
	Funding from financial investors lower than anticipated	2	3	May make ROI components of program unattainable or only partially attainable. Increases demands on non-investor funding. Delays program implementation. May affect program quality.	Significant risk, not easily mitigated	Investment System
	Funding from social investors (government, foundations) lower than anticipated	2	3	May make non-ROI components of program unattainable or only partially attainable. Increases demands on debt financing. Delays program implementation. May affect program quality.	Significant risk, not easily mitigated	Investment System
	Home energy savings are lower than anticipated as result of inaccurate estimates	1	3	Affects cashflow of property owners and possibly tenants. May not achieve poverty reduction outcomes. May make poverty issues worse. Negative client experience. Affects public perception of program.	Significant but unlikely risk, partially mitigatable	Housing Energy Management System
	Home energy savings are lower than anticipated as result of insufficient funding	2	2	Affects cashflow of property owners and possibly tenants. May not achieve poverty reduction outcomes. Affects public perception of program.	Moderate risk, not easily mitigated	Housing Energy Management System
	Home energy savings are lower than anticipated as result of conventional energy prices being lower than anticipated	1	2	Affects cashflow of property owners and possibly tenants. May not achieve poverty reduction outcomes. May make poverty issues worse. Negative client experience. Affects public perception of program.	Moderate but mitigatable risk	Housing Energy Management System

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Risk Category	Risk	*Risk Probability	*Risk Impact	Description of Impact	Risk Summary	Monitoring & Reporting on this Risk
Implementation Phase Requirements	Collaboration with First Nations communities is less robust than expected	2	1	Missed opportunity for reconciliation, partnership, economic development, and cultural exchange.	Minor risk, not easily mitigated	All program services
	Diversity targets not met for recruitment, training, and procurement as per Community Employment Benefit (CEB) reporting	2	1	Inequitable distribution of community economic benefits. Missed opportunity to build program strength by learning from disaffected segments of the community.	Minor and mitigatable risk	All program services
	Legislative & regulatory requirements are not met or delayed, including expectations around regulatory changes	2	2	Delays project implementation. Affects program targets, performance measures, and ability to meet outcomes. May result in energy affordability & security goals not being met.	Moderate risk, partially mitigatable	All program services
	Major regulatory change causes disruption to program	1	2	Effects generally unknown - may enhance or hinder program implementation, including costs and ability to meet outcomes.	Moderate but unlikely risk	All program services

Table 4.2

RISK MANAGEMENT STRATEGY 1: ESTABLISH CORE RISK MANAGEMENT STRUCTURES & PROCESSES

During the first year of the program (fiscal year 2020-21) a set of 7 program structures and processes will be put in place to establish an overall risk management process.

- Governance Structure & Commitments: establish an effective program governance structure as described in the **Governance chapter.** Effective risk management across all risk areas begins with strong governance. Effective governance requires long-term commitments from key program partners as they participate in key roles on the Energy Poverty Reduction Program Steering Committee.
- **Management Structure & Capacity:** establish an effective program management team with the capacity to implement the program, as described in the **Governance chapter** and earlier in this chapter. Qualified staff working under diligent oversight by Bridgewater Town Council and the Chief Administrative Officer will ensure that a broad range of program risks are minimized by having outputs achieved effectively and on budget. Management relationships with external organizations, in particular for the Coordinated Access System and the Financial Investment Vehicle, will reduce program risk through strong service contracts and/or partnership agreements, with responsibilities, deliverables, and timelines clearly defined.
- **Evaluation Process:** Phase 1 of the program will start with the program evaluation process already active, so that the process can support the program setup work from the very beginning, allowing staff and program partners to identify, communicate, and manage any and all program risks as they emerge. Effective and timely performance tracking mitigates risk through the early identification of areas where program deliverables are falling short or experience implementation delays, allowing for course corrections. Year 1 of this process will also involve the review of program indicators so that adjustments can be made to performance measurement methodologies and targets. The evaluation process and the program outputs and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

outcomes it will measure are described in the **Performance Measurement chapter.**

- **Communications System:** ensuring timely and effective communications between program governance, program management, program partners, and program clients mitigates program risk by reducing opportunities for misunderstanding, speeding up processes, and maintaining cohesion across the multiple service areas. Detailed communications strategies will be developed for program services with high community engagement and marketing needs. Program communication will ensure cautious and transparent communication with residents on their rights related to sharing data, who will be able to see their data, and how it will be stored. Strong communication regarding the confidentiality of participants' sensitive information will be ensured to maintain trust with participants and ensure that at-risk, and vulnerable populations are insulated from potential risks for sharing sensitive information when accessing services. Program communications are the responsibility of all program managers, and are overseen by the Program Coordinator.

- **Quality Control / Quality Assurance Process:** The system to maintain the standards of the Energy Poverty Reduction Program consist of a three-level hierarchy of controls. The first level, and closest to the client, consists of an Ombudsperson and a Client Advisory Circle. These roles relate to communicating client experiences directly to the program governance and management teams, and resolving client complaints, program quality concerns, and program impact deficiencies. They are further described in the **Governance chapter.** If quality control has not been assured via the first-level supports, then issues can escalate to the Program Steering Committee where authority to make program decisions to ensure ongoing quality will be granted in the Terms of Reference. If quality control concerns exist after this second-level support, concerns can be directly expressed to the Town Council, who maintains the ultimate authority over all municipal programs.

- **System Gap Analysis Review Process:** Through the evaluation framework, emergent risks are continuously monitored across all program areas. Among these, a key risk relates to a lack of program accessibility. This is mitigated by continuously asking about whether client and stakeholder needs are being met, or whether people are 'falling through the cracks' as a result of system gaps. System gaps are also mitigated through regular contact with the Client Advisory Circle, which provides a direct channel for program clients to communicate unmet needs.

- **Privacy Review Process:** To ensure all privacy related precautions are met and data and privacy breaches are mitigated, the entire program will be evaluated from a privacy perspective through the completion of a comprehensive PIA coupled with an overarching Privacy Policy. To ensure both documents are adequate and adhere to standard privacy practices the Town will consult with privacy experts throughout the first year of the program and for all aspects of the program design.

These structures and processes will be designed, implemented and evaluated by the program management team as part of the delivery of outputs related to Overall Program Management. Major risk management checkpoints for this strategy are 6 months into year 1 (October 2020), and 11 months into year 1 (February 2021). These timeframes allow critical course corrections to be made through the risk mitigation options available at each stage (see below).

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

RISK MANAGEMENT STRATEGY 2: CONFIRM FEASIBILITY OF PROGRAM

Each program service will undergo a detailed feasibility reviews 6 months before the end of Phase 1 (October 2021), and 6 months before the end of Phase 2 (October 2023), so that overall program feasibility can be assured by Phase 3 (Final Program Activation). Completing feasibility checks, and making any necessary course corrections, also helps ensure that Phase 1 and Phase 2 outputs can be achieved on time. As a risk mitigation strategy, feasibility will be assessed based on 9 areas of program performance.

These feasibility assessments will be completed by the program management team, and will allow critical course corrections to be made through the mitigation options available at each stage (see Table 4.2).

RISK MANAGEMENT STRATEGY 3: ESTABLISH CONTINUOUS MONITORING & IMPROVEMENT SYSTEM

Following the successful completion of Phases 1 and 2, risks related to program feasibility will have been assessed and mitigated, and the program will transition through Final Program Activation (Phase 3) into Program Maturity (Phase 4). This transition will require an amended risk management strategy, which is to deliver these risk management functions through a system of continuous monitoring and improvement.

Program Feasibility Assessment and Criteria

Feasibility Assessment	Feasibility Assessment Criteria
Client Participation	• Client participation rates are sufficient to meet program objectives and performance measures • The program sufficiently meets client satisfaction and needs • The program is sufficiently accessible to intended clients
Service Costs	• Current and future service costs are sufficiently known to enable service delivery planning and contracts • Service costs are within tolerable thresholds to meet program objectives and performance measures
Service Capitalization	• Current and future revenue sources are sufficiently known to enable service delivery planning and contracts • Revenue sources are within tolerable thresholds to meet program objectives and performance measures • The program sufficiently meets funder and investor satisfaction and needs
Data Availability	• Data governance processes and agreements meet partners' and clients' needs • Sufficient data is available to enable service delivery planning and contracts • Key partners and service organizations are able to share sufficient data to meet program objectives and performance measures
Data Platform Setup	• Data platforms have the minimum functionality required to achieve program objectives and performance measures • Data platforms have sufficient oversight, quality control, and security in place to meet partners' and clients' needs
Technical Solutions	• Energy management solutions are sufficiently known to enable service delivery planning and contracts • Performance of energy management solutions is sufficiently measurable to meet program objectives • Energy management solutions are sufficient to meet program objectives and performance measures • Energy management solutions sufficiently meet client satisfaction and needs
Supply Chain & Procurement	• Procurement processes for program services and products results in adequate value and contractual security to meet program objectives and performance measures • Program service providers and product suppliers have sufficient capacity to meet program objectives and performance measures over the long term • Procured services and products meet partners' and clients' needs
Regulatory Limitations	• Current and future legislation and regulations are sufficiently known to enable service delivery planning and contracts • Legislation and regulations enable program services to meet program objectives and performance measures
Program Impact	• Program outcomes and indicators are sufficiently measurable to understand program impact • Program outcomes are achieved • Program impact is defined holistically, and current and emerging gaps in program impact are reevaluated on a regular basis

Table 4.3

This system will be designed in full during Phase 3, and will likely retain a number of risk management, quality control, and performance measurement elements from Phases 1 and 2, as well as additional elements to address emerging risk issues. The continuous monitoring and improvement system will be carried out by the program management team, and will work in

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

conjunction with the core risk management structures & processes defined in the first risk management strategy.

PROGRAM COURSE CORRECTION CHECKPOINTS AND RISK MITIGATION OPTIONS

The primary program course correction checkpoints discussed above allow the program management team to implement risk mitigations to improve service design and delivery should the program experience feasibility challenges or fall short on its performance expectations. Depending on the severity of risks identified through risk management and quality control activities, mitigation options may include the following:

- **Change program outputs** – revising program activities and deliverables may address a wide variety of risk, quality, and performance needs.

- **Reduce data platform functionality** – as a major source of program risk, the cost and technical complexity of the data platform may be need to scaled back in scope in order to achieve a minimum viable product (MVP) that is manageable while still achieving program outcomes.

- **Change performance indicators** – altering indicators may more effectively or more practically measure progress toward program outcomes.

- **Change partners** – program partners and service providers may be unable to achieve program deliverables, share data, or participate as meaningfully as originally intended. Finding new partners may allow the program to better meet its outcomes.

- **Increase supply chain capacity** – a major source of program risk, service provider and product supplier capacity may be insufficient to meet the significant needs of the program. Issuing stable long-term contracts, requiring capacity building activities as part of contracts, collaborating with regional trade networks and training programs, and advocating for government policies that increase trade sector capacity may all be necessary to bolster the quality and capacity of program suppliers and service providers.

- **Improve communications** – as insufficient client uptake is a major program risk, altering communication strategies may be required. Improved communications may also be necessary to attract greater interest from funders and investors.

- **Increase funding** – as a town with a very limited ability to draw additional resources from its tax base, Bridgewater lacks the means to put substantial program dollars on the table should funding levels be insufficient to meet program needs. Should program revisions described above yield insufficient risk reduction or quality improvement, or fail to build the necessary program capacity, additional funding sources may be needed to achieve program outcomes. This may result in program implementation delays.

- **Lobby for regulatory change** – municipalities are created and regulated by legislation. If any regulatory impediments or barriers are discovered, we may need to lobby to the provincial and federal governments for change, which can take time and may lead to delays in program delivery and or achievements.

- **Change outcomes** – as a last resort, program outcomes may need to be shifted to become more manageable, or abandoned altogether, if other mitigation options cannot allow the program to achieve the outcomes while also resolving program risks and quality issues.

Table 4.4 provides a preliminary assessment of the risk mitigation options that may address program risk and quality concerns at key course correction checkpoints.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Program Feasibility Assessment and Criteria

Risk Management Strategy		Course Correction Checkpoint(s)	Risk Mitigation Options

Table 4.4

Project Continuation After Smart Cities Challenge

Continuation After Smart Cities Challenge

Smart Cities funding will create the prototype for the Energy Poverty Reduction Program and will ultimately demonstrate the feasibility and value of this initiative continuing over the long term.

Our dedication to energy poverty reduction is evidenced in the **Performance Measurement** and **Financial chapters,** where program considerations for years 6 through 10 are described. Commitment for Town Council's ongoing role in Bridgewater's energy future was proclaimed on January 8, 2018 with the formal adoption of the 32-year Community Energy Investment Plan.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

ENERGY POVERTY REDUCTION THROUGH CONNECTED TECHNOLOGY PLATFORMS

From streamlining client intake, to enriching investment tools, to improving energy flows, connected technology plays a crucial role in all aspects of the Energy Poverty Reduction Program. A central feature of the program design is to empower households-at-risk by providing them with control over their home energy options through building upgrades that measure and monitor usage so that they can actively manage and control their energy costs.

Emerging connected technologies for household energy management built on the internet of things (IoT), big data and intelligent energy management systems are fundamentally changing the practices of households and their daily, monthly and annual energy budgets.

Evidence suggests that energy security is a significant stress factor for households-at-risk. There are cascading negative effects of missing payments on energy bills that result in financial impacts critically affecting all aspects of household life. The ability to optimize energy supply and consumption and to deliver energy reserves such as stored electrical power on demand, particularly in emergency situations, is an emerging requirement directly attributable to connected "smart" technologies and distributed energy resources.

Such technology includes smart thermostats for residential houses and smart thermal optimization for multiunit residential and municipal buildings as well as connected clean technology solutions for energy generation such as residential microgrids, virtual community loads and power plants and electricity micro market management.

At a high-level, this connected technology solution is based on three energy management "pillars" that are interoperable with one another and are all housed within an **energy resource planning platform:**

- An advanced **enterprise resource planning (ERP) system** for municipalities to ensure their housing and mobility assets are integrated with existing applications to support the households-at-risk in the community and will rely heavily on the diligent use and interoperability with the Energy Management Information System (EMIS) and Real Time Operations (RTO) system.

- an **energy management information system (EMIS)** focusing on housing energy management and community energy systems and solutions that will enable energy data monitoring and analytics. The EMIS will operationalize the efficiency of foundational and advanced applications related to energy productivity for the households-at-risk, and broader municipal energy efficiency programs. The EMIS is fully connected to the ERP system to ensure fluidity of information without compromising accuracy.

- a **real time operations (RTO) system,** enabled through supervisory control and data acquisition (SCADA) and energy management system (EMS) solutions, that will leverage the value of the program assets and coordinate its controls in real time. The RTO system is a crucial component to minimizing energy use and maximizing efficiencies, and represents the final stage of the energy resource planning platform development once the municipal ERP system and EMIS are deployed and in operation.

These pillars will enhance the experience of households, sustain optimal levels of performance and reduce the costs of household energy use. The coordinated connected technology solutions focused on the buildings where households-at-risk live will make their homes highly efficient, more comfortable, healthier places to live. In addition to direct benefits, households will be empowered by having greater control of their energy use while encouraging household interactions and knowledge sharing.

Processed under the provisions of the Access to Information Act/Révisé en vertu de la Loi sur l'accès à l'information

ENTERPRISE RESOURCE PLANNING (ERP) SYSTEM

Enterprise resource planning (ERP) systems are packaged application software suites that support the common business processes, functions and data for the systems of record in an enterprise. The ERP is the system of record - the authoritative source of data that any stakeholder in an enterprise can reference to support their activities. The ERP achieves this by enabling the flow of information across the organization, in end-to-end business processes, through a comprehensive set of interconnected systems modules. Modules can be utilized in different combinations, presenting unique ERP options to meet different administrative, management, operational, analysis and reporting needs. This element of the data platform can be replicated and scaled according to local conditions.

Bridgewater's existing municipal ERP is TownSuite Municipal Software. The platform is used for finance, asset management, land management, human resources, eBilling, and customer service functions. This modified data platform would house the three pillar systems and will be operated in connection with the external Coordinated Access System data platform (HIFIS) as well as an external Financial Investment Vehicle dealing with traditional and community investors. An early conceptual diagram of the integration of the municipal ERP, EMIS, and RTO functionality is provided in Diagram 6.1.

Dialogue with Townsuite has suggested that the Energy Poverty Reduction Program can be built onto this ERP but a full assessment of functionality options, development requirements, and timelines is needed to establish an agreement.

> A one stop shop aided by technology for navigation of services would dramatically improve access to services for clients.
>
> - COMMUNITY SERVICES ORGANIZATION REPRESENTATIVE

ENERGY MANAGEMENT INFORMATION SYSTEM (EMIS)

To provide community energy management support services and achieve the outcomes of the Energy Poverty Reduction Program, it will be necessary for the Town to collect and monitor energy data, and to manage energy information on behalf of participating program clients. This functionality is achieved through the addition of the energy management information system (EMIS). The EMIS will provide relevant information to households-at-risk, property owners, and municipal departments, enabling them to improve the energy performance of their assets. The EMIS will operationalize the municipality's energy management objectives and provide an efficient means to audit and depict Energy Poverty Reduction Program outcomes.

The principal objectives of the EMIS proposed in the program is to support the municipality's energy management programs through:

- A comprehensive operations, sustainability and planning information system
- Visualizing and understanding the consumption of various types of energy through a set of energy dashboards and other analysis-based tools
- Quantifying energy use of individual home, buildings or processes
- Early detection of poorly performing buildings, systems or processes
- Reporting functions including auditing and the ability to identify performance trends

These functions, and their relationship to client homes and other community energy assets, are visualized in Diagram 6.2.

Features of the EMIS in the EPR system include a user focused web-based dashboard, the storage of data in a usable format, the calculation of effective targets for energy use, and comparison of actual consumption with these targets. Elements include sensors, energy meters, hardware and software, which may already exist as process and business performance monitoring systems.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

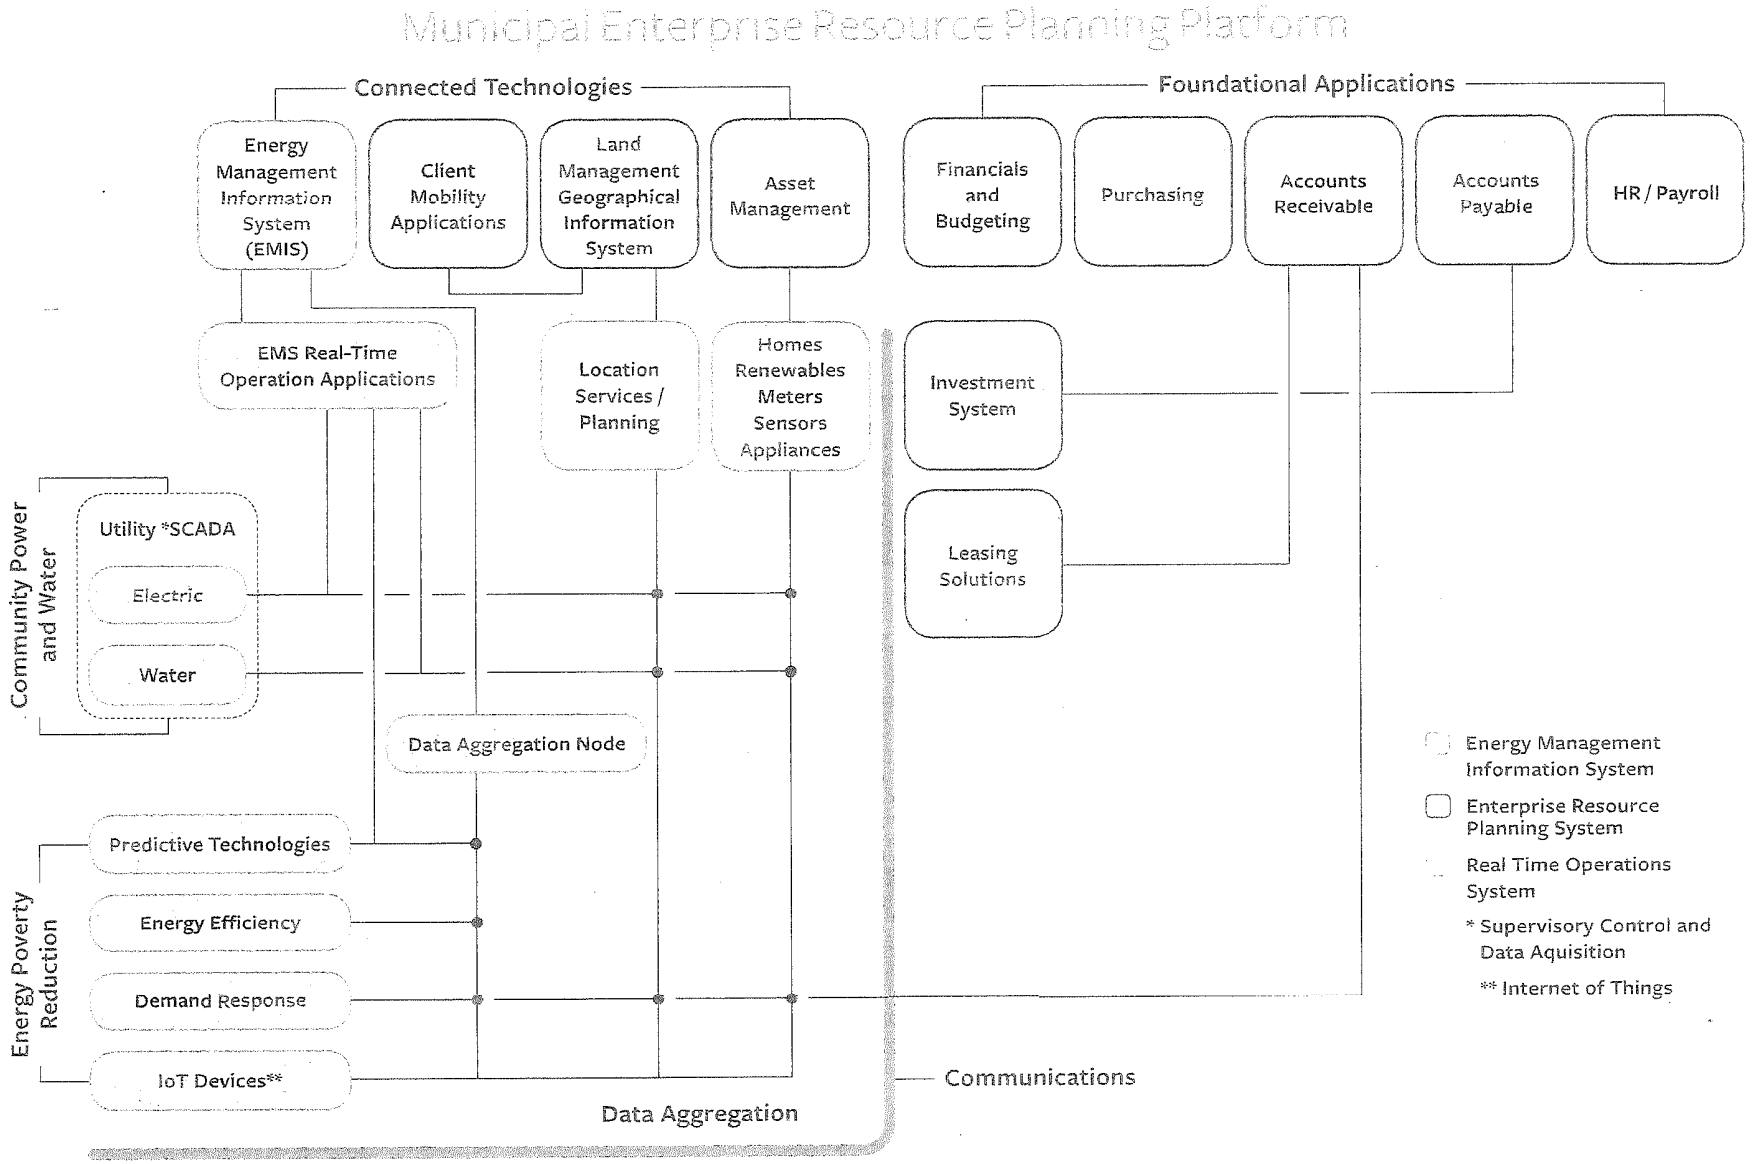

Diagram 6.1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Energy Management Information System Overview

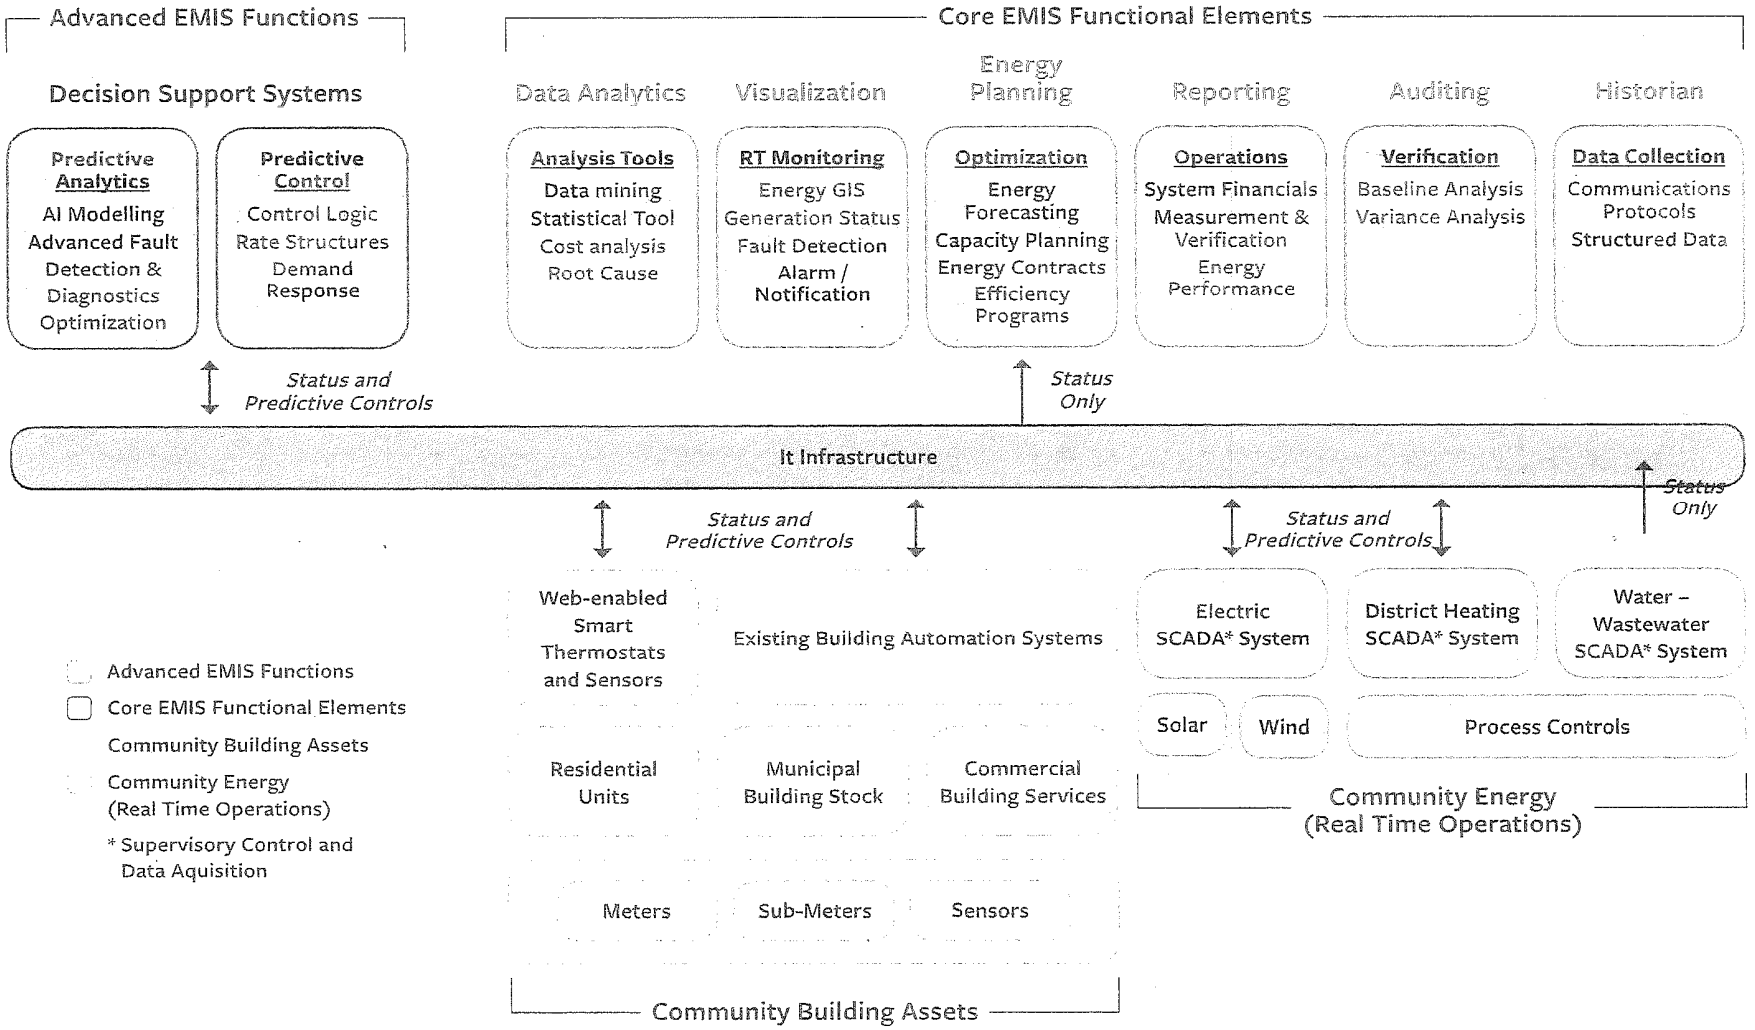

Diagram 6.2

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

EMIS functionality relies on the following three components:

- **Monitoring:** the EMIS coordinates the monitored data flow from all existing real estate and energy assets. It includes energy use, generation and storage for each of the project assets in energy units - expressed in kilowatt hours (kWh) and/or gigajoules (GJ) - as well as carbon footprint - expressed in tonnes. It also includes related energy costs and the costs of energy improvements. Finally, the EMIS also includes exterior environmental conditions such as ambient weather and interior environmental conditions such as room temperature and humidity. To visualize the project outputs and results, the EMIS intends to have a comprehensive dashboard as a key program tool. It also has an advanced historian to archive compressed data without overloading the server.

- **Descriptive Analytics:** a performance and auditing tool that analyzes historical data to define the reasons for past performance successes and/or failures.

- **Predictive/Prescriptive Analytics:** an advanced analytics component that leverages real time operations (RTO) controls of energy assets and utility resources. It combines real time energy data with external data on any scale, which allows it to estimate the future energy consumption patterns of a single home, a multi-unit residential building, a neighbourhood energy system, or even the Energy Poverty Reduction Program or community as a whole. Prescriptive analytics goes beyond predicting future outcomes by suggesting beneficial energy management actions and showing the implications of each decision option.

REAL TIME OPERATIONS (RTO) SYSTEM

The real time operations (RTO) system leverages the value of the program assets and coordinates its controls in real time. The RTO system becomes active at the final stage of the program development when the core operations of its municipal enterprise resource planning system and energy management information system are deployed and in operation. The RTO system leverages the operations of the household and community energy assets in real time thus bringing additional hourly, daily, monthly and annual value to the community.

The two key parts of the RTO system are the supervisory control and data acquisition (SCADA) and the energy management system (EMS).

Supervisory Control and Data Acquisition

SCADA is a category of software application programs and hardware devices for process control. These systems gather data in real time from remote locations in order to control equipment and conditions. SCADA is used in power plants, power distribution, as well as in oil and gas refining, telecommunications, transportation, and water and waste control.

SCADA systems allow the community to:

- control distributed energy resources and industrial processes locally or at remote locations
- monitor, gather, and process real-time data
- directly interact with devices such as sensors, heating ventilation and air conditions (HVAC) equipment, photovoltaic (PV) generators, and more through human-machine interface (HMI) software
- record events into a log file

SCADA systems offer important functionality for the Energy Poverty Reduction Program's more advanced operations as they help to maintain efficiency, process data for smarter decisions, and communicate system issues to help mitigate downtime.

Energy Management System

The main goals of sustainability in the grid revolve around economic operation, reliability, and environmental impact. One of the main advantages of the energy management system

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

(EMS) is that it can supply households with electricity and guarantee the reliability and intelligence of the power system.

The EMS can receive supervisory control signals based on requirements of the main grid. The system's operation policy depends on the ownership structure, connection status and market model.

The major reasons for the RTO-enabling energy management systems are as follows:

- accommodates intermittent distributed energy resources such as solar panels or energy storage in the grid
- reduces grid operation cost and emissions, thereby increasing energy efficiency
- improves grid stability, reliable fault ride-through and seamless mode transitions making the entire system more resilient

RTO - Energy Management Cycle

The RTO energy management cycle, presented in Diagram 6.3, illustrates the power of RTO functions when they work together to reduce energy poverty. This cycle forms the heart of the data and connected technology-driven energy performance improvement process, as communications between smart systems increase energy savings and energy generation. This enhances financial returns, enabling further investments in energy solutions.

CONNECTED TECHNOLOGY APPLICATIONS FOR ENERGY POVERTY REDUCTION

Connected energy technology applications are the practical on-the-ground solutions that work in unison with the data platforms described in the previous sections, and whose functions are enabled and enhanced through those platforms. These applications have a common purpose in reducing energy costs and increasing energy security for Bridgewater residents. They fall into 2 categories: connected energy efficiency solutions and connected clean energy solutions.

CONNECTED ENERGY EFFICIENCY SOLUTIONS

These are digital controls that use advanced analytics to generate energy savings:

- Smart Appliances: a smart appliance is connected to other devices or networks via wireless protocols such as Bluetooth, Wi-Fi, 3G, etc., that can operate to some extent interactively and autonomously. Smart appliances utilize modern computer and communications technology to make functions faster, cheaper and more energy-efficient.

Real-time Operations Energy Management Cycle

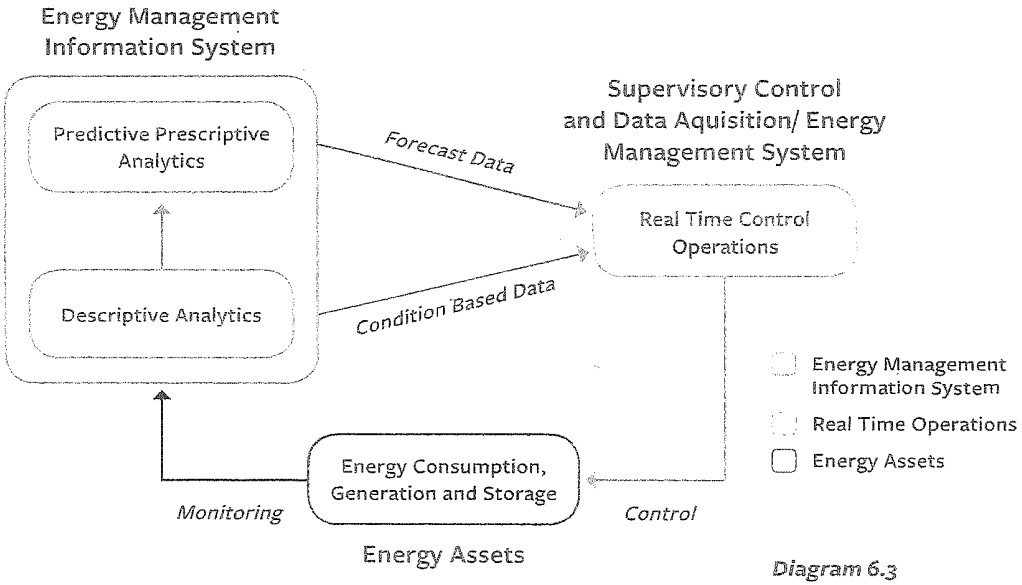

Diagram 6.3

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **Smart Thermostats and Smart Meters for Households:** smart thermostats and smart meters form a two-stage approach to the connected technology strategy. When coupled with advanced analytics and artificial intelligence, smart thermostats can be networked or clustered together in the community to participate in a broader energy management control system.

- **Smart Thermal Optimization:** smart thermal optimization for multi-unit residential buildings (MURBs) improves the efficiency of a building's energy use by anticipating and reacting to the changing weather conditions and requirements for heating and cooling in real time. Because weather and heating/cooling loads can vary significantly throughout the day, the impact of intelligent prediction is significant. This allows for reducing building heating and cooling energy costs by on average by 10% to 25% while improving tenants' thermal comfort.

CONNECTED CLEAN ENERGY SOLUTIONS

Electricity grids are experiencing a major transformation. Connected technologies improving energy efficiency of electrical loads (such as buildings and electric vehicles) and distributed energy resources (like solar PV and energy storage) make grid operations increasingly complex. They also maximize the potential of clean, robust and flexible power grids in a low carbon future. The following connected clean energy solutions allow for the development of residential microgrids, which has a transformative impact on the power grid:

- **Residential Solar PV for Households:** residential solar PV systems can supply households-at-risk with clean, reliable and affordable electricity. When enabled with connected technology, they help coordinate the household's electricity use with the rooftop solar energy generation potential.

- **Combining Solar PV and Storage:** adding energy storage to a grid-connected PV system allows households-at-risk to store surplus solar energy for use later in the day, and provides a back-up power supply in the event of a power outage, thereby increasing energy security.

- **Predictive Energy Management (PEM) for the Community:** an emerging connected technology for reducing energy use for heating, ventilation and air conditioning (HVAC) of houses and buildings while enabling on-site solar energy generation and storage to provide auxiliary services to utilities in real time. It features coordinated supervisory predictive control of energy consumption, on-site generation, storage and ancillary services for hosting utilities. PEM promises to be a flexible distribution system infrastructure that promotes increased levels of distributed renewable energy generation and enables improved control and automation on the electricity distribution grid. The PEM solution also provides flexibility within smart grid implementation to support future innovative applications, such as energy storage, and incorporate principles of modularity, scalability and extensibility into smart grid planning.

FEASIBILITY ASSESSMENT

The feasibility of the connected technology solutions discussed above, has been confirmed by the research done in this final application development stage. Town of Bridgewater and our Townsuite Municipal Software service provider have experience and expertise with advanced ERP systems. We can confirm that key features of the software are well known, understood and tested in the municipality.

The EMIS Planning Manual and Tool[4] and the Canadian Industry Partnership for Energy Conservation (CIPEC), as well as EMIS practices and documentation have been reviewed by our technical team. The NRCan's EMIS approach is

[4] Developed and tested by Natural Resources Canada

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

based on innovative energy management and strong experience in the industry and makes the proposed EMIS completely feasible for the Town of Bridgewater, and a new standard for municipalities in Canada. The key innovation in the Energy Poverty Reduction Program is related to high resolution predictive analytics and its focus on improving lives of at risk households rather than those who can afford it.

The real time operations (RTO) system for the Town of Bridgewater is based on digital SCADA coupled with energy management systems (EMS). These systems are used in many industries throughout Canada and abroad, thereby strengthening the program's ability to be replicable and scalable. Based on a review carried out by the program's technical team the proposed digital SCADA/EMS combination is highly feasible for municipal utility applications.

OPEN TECHNOLOGY PRINCIPLES AND ARCHITECTURE

One of the major inhibitors to the adoption of connected technology in smart buildings and smart cities has been the lack of interoperability between different building systems. The program's connected technology solution ensures that all connected devices are speaking the same language, allowing them to 'talk' to each other and exchange information.

Adopting open protocols for houses and buildings, such as LonWorks or ASHRAE's open-source BACnet, allows all systems to communicate in a common protocol language. These common protocol languages define the arrangements under which devices and systems interact and communicate with each other.

One key advantage of open standards architecture and open protocol systems is that they enable the integration of new devices and internet of things (IoT) sensors and systems, as long as these devices also communicate using an open protocol language. A building that adopts open architecture standards is, therefore, effectively 'future-proofed' against vendor-generated proprietary constraints through the international standard EN62402 Obsolescence Management Safeguards. Thus, new functions and devices can be easily installed when enabling technologies are developed. This is further supported by our commitment to a local workforce that will be trained to implement and operate the technologies and systems going forward.

GENERATING INTELLECTUAL PROPERTY

The program will generate intellectual property (IP) for the community and the households-at-risk related to social and technical navigation, solutions, services, and related connected technology. The program team recognises that free access to, and reuse of, these open licences is an essential part of making the program replicable to other communities and the Town is committed to sharing IP so long as privacy is not compromised.

The program will support the distribution of connected technology IP through:

- the release of IP for connected technology using open licences or other relevant instruments - while respecting intellectual property rights - so that no restrictions or charges are placed on the re-use of the information for non-commercial or commercial purposes, save for exceptional circumstances;
- the release of IP for connected technology using application programming interfaces (APIs), where appropriate, to ensure easy access to the most regularly updated and accessed connected technology; and
- encouraging innovative uses of our IP for connected technology through mentoring for its users nationally and internationally.

TECHNOLOGY IMPLEMENTATION PLAN

TECHNOLOGY IMPLEMENTATION TIMELINE

The timeline for the program's connected technology solution is described in Table 6.1.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

STANDARDS AND GUIDELINES

Enterprise resource management, EMIS, SCADA/EMS, and connected technology guidelines and standards will be communicated to, coordinated with, and confirmed by connected technology partners, vendors and energy service providers to ensure full technology interoperability where necessary.

These standards and guidelines will also be discussed with and confirmed by the connected technology partners, vendors and energy service providers to ensure and guarantee the replicability and scalability of program during the Smart Cities Challenge timeframe, toward 2030, and beyond.

The following standards and guidelines have been thoroughly reviewed for consideration:

- Canadian Standard on Enterprise Resource Planning Systems
- ISO 50001 Energy Management Systems Standard
- The International Society of Automation - Standard ISA112 SCADA Systems
- International Electrotechnical Commission - IEC 61968 Standards Based Integration for Distribution Management System
- Natural Resources Canada - Energy Savings Toolbox
- Natural Resources Canada - Energy Management Information System

ROLES AND RESPONSIBILITIES OF TECHNOLOGY PARTNERS

The program team over the finalist proposal phase has built strong relationships with a variety of connected technology solution partners and has communicated accessibility and usability of the connected technology solutions to the households-at-risk, community energy owners/operators, energy service providers, investors, and other stakeholders that support their uptake and acceptance in the program. This allows the program team to keep confident in the commitments of the partners during the program timeframe and towards the community's long-term objectives, to ensure the value to the households-at-risk and to the municipality, and to enable and train the municipal and community services' workforce. These partners are identified in the **Project Management chapter.**

Technology Implementation Plan: Energy Poverty Reduction Project Connected Technology Solution Timeline

Relationship to Smart Cities Challenge (SCC)	**Within SCC Program & Funding**			**After SCC**
Phase	1: Prototype Program Setup	2: Prototype Program Testing & Refinement	3: Final Program Activation	4: Program Maturity
Timeframe	2020-2022 (2 years)	2021-2024 (3 years)	2024-2025 (1 year)	2025-2030 (5 years)
Municipal Enterprise Resource Planning (ERP) System	Definition and Deployment of Modifications to Existing ERP Module	Definition and Deployment of EMIS Connectivity	Full Operation	Full Operation
Energy Management Information System (EMIS)	Definition and Deployment (houses)	Development and Deployment (MURB) RTO Monitoring/ Analytics Integration	Full Operation	Full Operation
Real Time Operations (RTO) System	Municipal RTO System Design	Deployment and Testing (houses, MURB and municipal buildings) Community Energy Integration	Full Operation	Full Operation

Table 6.1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The Town of Bridgewater proposes that the use of data and connected technology will catalyze energy related activities and outcomes. The data platforms selected will apply industry best practices to secure highly sensitive data collected from the Coordinated Access System, Municipal Enterprise Resource Planning (ERP) platform, Community Energy Systems, and Investment Systems. Further, it will defend against security breaches and protect personal information and privacy. Through continuing Energy Poverty Reduction Program efforts, Bridgewater will demonstrate to the community a commitment to responsibly managing data through its lifecycle with security and privacy considerations addressed.

ENERGY POVERTY REDUCTION DATA

DATA TYPES AND SOURCES

The Energy Poverty Reduction program expects to process data related to the following groups: household, property/asset, energy efficiency solutions and services, and investors.

TYPES AND METHODS OF DATA PROCESSING

The types and methods of data processing in the program include collection, generation, analysis, storage, and transmission of important data related to existing foundational ("legacy") technologies and connected technologies.

- **Open data:** this is all data that is (a) non-privacy-restricted and non-confidential, (b) produced with either public or private resources and (c) made available without any restrictions on its usage or distribution. The municipal methodologies to manage open data are an open data portal and an open data policy.
- **Personal information, personal health information, and non-personal information** (as defined in *FOIPOP act*): this is data that is restricted and/or licensed and requires permission to be published or distributed; it includes data held privately because its value has not yet been identified. The municipal instruments to manage private data are data security and privacy policies, procedures, legislation and regulations, as well as authentication and access controls.
- **Commercial data:** these are all types of licensed data with a financial value for use and distribution. Commercial data may be produced with either public or private resources. The municipal instrument to manage commercial data are data security and privacy policies, procedures, legislation and regulations, contracts, licenses, data transaction platforms, and data policies and principles.

The program's data platform concept also enables re-use and re-distribution of data, as well as derivative production, archiving, and preservation of data that reflects the entire data lifecycle in the Energy Poverty Reduction Program's design. This includes individual data related to households-at-risk processed in the Coordinated Access System, energy poverty reduction solutions and services data as well as energy use, generation and storage and environmental data processed in the municipal enterprise resource planning (ERP) platform, investments and other related data processed by the Investment Systems.

DATA USE

Accurate and timely data disseminated through technologies described in the **Technology chapter** is a crucial component to all 5 systems defined in the VISION chapter for the following reasons:

- **Community Energy Systems:** Energy produced by these systems credit participating household energy use.
- **Housing Energy Management Systems:** Energy use from the household level down to the appliance level define energy savings and promote it through demand-side-management and analytics.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

- **Coordinated Access Systems:** Data stored in the system streamlines Town and community service organization operations.

- **Mobility Improvement Systems:** Data shared through the above systems allow Town Planning and Operations to increase the ability of at-risk residents meet their mobility needs.

- **Investment Systems:** Energy savings and production earnings need to pass to investors in accordance to investment offerings.

DATA SECURITY

In alignment with the philosophy of "privacy by design", the program has applied focused efforts to integrate data security and privacy considerations into the project design; this was particularly important for the households-at-risk but is valued by all stakeholders.

The Town of Bridgewater and/or contracted proponents will control and own all data collected using the program's data platform including any modifications, improvements, and derivatives of such data. The data is personal and confidential and will not be disclosed or made available unless approved by the Town of Bridgewater. This data will be assessed using a Threat and Risk Assessment methodology prior to holding any live data.

IDENTIFICATION OF RISKS

Through the development of this application, we have been progressing with the identification of risks and the development of appropriate mitigating strategies for data management of the households at-risk of energy poverty. This includes completion of a preliminary Privacy Impact Assessment as part of this proposal.

ENERGY POVERTY REDUCTION DATA PLATFORM

CONCEPT

The Energy Poverty Reduction data platform will harvest the data generated by energy efficiency and clean energy solutions for households-at-risk, inform decision-making of households, the municipality and the stakeholders, and will advance and improve the performance and application of the connected technologies used. The Energy Poverty Reduction Program will also leverage its resources to build and maintain in-house analytics. The Town will develop an Energy Management Information System (EMIS) to collect, process and analyze the data provided.

STRUCTURE

The Town of Bridgewater sees the program's data platform as a leading smart city platform ensuring interoperability of/integration with existing federal, provincial and community data platforms and has identified high quality candidates for these functions.

> We understand that data and connected technologies can tremendously benefit cities or small communities enabling the discovery and more in-depth understanding of the needs of the local population
>
> DALHOUSIE UNIVERSITY PROFESSOR

The data platform will include three major components: Coordinated Access System, Municipal Enterprise Resource Planning (ERP) platform and Investment Platforms.

The Coordinated Access system is planned to allow community organizations and service providers to collect and manage personal and personal health information on clients who are housing-insecure or homeless. This data platform will reside outside of the Town's municipal services and be used by community partners for the Coordinated Access System that would support households at risk.

The connected technology solutions enabled through the ERP platform will coordinate the households and the municipality's real estate and energy assets and energy solutions. This will be a split internally- and externally-accessed platform providing all necessary analytics and controls data for real time and planning/ reporting operations.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

There will be an internal and external investment platform orchestrated by an Investment Navigator. Community and traditional investment data will be housed in a secure database, abiding to federal and provincial rules and regulations hosted by an organization procured by the town.

FUNCTIONALITY

The data platform provide the following functions:

- **Acquisition/Interconnection:** These provide data capture mechanisms from the collection systems.
- **Data/Knowledge:** These support data processing, adding value and transforming information into knowledge.
- **Interfacing:** These enable access to information at different levels.
- **Service support:** These coordinate all the possible services involved in each action developed out of interoperability functions.
- **Security and management:** These provide horizontal functionalities such as audits, monitoring and security.

Two key interfaces allow for communication between the above group of functions:

- **Acquisition:** This interface with the program data platform enables information collection from the external elements.
- **Interoperability:** This interface with the program data platform enables communication with external data providers and the third-party computation systems.

INTEROPERABILITY WITH CONNECTED TECHNOLOGY SOLUTIONS

DATA SERVICE PLATFORMS ENABLED BY CONNECTED TECHNOLOGIES

The Energy Poverty Reduction Program data platform will have access to different information sources, share resources, analyse capacity and coordinate services, usually based on predictive analysis. The concept referred to as "horizontality" is to be applied to the program. Through "horizontality" information from various sources interact with one another in order to provide streamlined services and operations.

INTEROPERABILITY WITH DATA SERVICE PLATFORMS

Data service platforms enabled with connected technologies provide various services in specific areas. These service platforms (known as "verticals") are provided by supervisory control and data acquisition (SCADA) or more complex platforms. Most of the time these platforms are independent and do not share resources, or they do so sparingly.

The introduction of the program's data platform will enable the integration and optimization of vertical service platforms and facilitate the exchange of information and resources between these vertical service platforms. On one hand, the resources and systems used by the vertical platforms supporting the same functions can be pooled and on the other hand, the information that is stored and processed by one vertical platform can be used by the others, enabling the generation of cheaper, more valuable and more complex services.

Vertical platforms will be integrated with the program's data platform in two ways. They can be deployed inside the program or can be integrated using open interfaces, in which case the processes and resources required by the vertical platform could not be deployed inside the Energy Poverty Reduction program.

Open interfaces are required to interconnect the program's data platform with other municipal platforms enabling other systems to interoperate with the program more efficiently. In the integration process some resources, such as data source, can be shared. Since the services can access more data sources, it is possible to create new services and improve those that already exist. Predictive analysis is also facilitated, because more data sources are accessible.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

The program's data platform could interoperate with external providers' platforms, and its interfaces are required to be adapted. The adaptation of these interfaces will depend on the type of platform.

DATA PLATFORM SECURITY

The Town of Bridgewater will control and own all data collected by the Energy Poverty Reduction Program data platform including any modifications, improvements, and derivatives of such data. The data is personal and confidential, and thus will not be disclosed or made available unless approved by the Town of Bridgewater. At all times the program's data platform and related technologies must be compliant with all applicable privacy legislation provincially. Cyber management is examined in further detail in the preliminary Privacy Impact Assessment (PIA).

NETWORK SECURITY

The network provider will take a number of steps to ensure the security of their networks. A dedicated team of security professionals will focus on network security and security governance. This will include, but is not limited to, multiple levels of security such as service security authentication mechanisms, secure access to client locations/sites, change control validations/ processes/policies and network monitoring tools/ applications/audits. This will be confirmed through the completion of a Threat and Risk Assessment. The Office of the Information and Privacy Commissioner for Nova Scotia (OIPCNS) has outlined the importance of designating a Chief Security Officer who is responsible for security: IT system maintenance and security, security awareness, ensuring digital and physical security, etc. for both the program and municipality. The Town will act on this recommendation as part of the detailed program design.

RESILIENCY

The Energy Poverty Reduction data platform will ensure the ongoing operation of services according to established service level agreements. These services may require availability 24x7 and a service level of over 99.9% annually. Providers may offer solutions complying with these requirements.

CYBER THREATS MANAGEMENT

Cyber threats to the program's data platform will be addressed through cybersecurity scanning and tests in the Platform, for threats such as malware, phishing, spear phishing, lost or stolen devices, distributed denial of service.

OPEN DATA AND BIG DATA STRATEGIES

THE OPEN COMMUNITY

The municipality's need for transparency and accountability has always been seen as fundamental by the Town of Bridgewater. The community is very supportive of the Open Government Partnership (OGP) created in 2011 and having Canada among its 75-member countries.

OPEN DATA FOR THE ENERGY POVERTY REDUCTION PROGRAM

The Town will make certain data types open to public stakeholders through online portals. This will come at no cost to the user and a standard license to allow re-use and distribution may apply.

Municipal data, like any data collected by public institutions, are subject to privacy legislation for personal information and other restrictions which limit it being made public (e.g. intellectual property).

The program defines the data spectrum including closed data (internal access), shared data (with group-based access) and open data (with public access and open to everyone).

The program data management addresses important Open Data strategy development related to high resolution environmental data and data analytics, public housing and mobility data and data analytics as well as public data on energy efficiency and clean energy solutions and services for the Bridgewater community.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

COMMITTING TO G8 OPEN DATA CHARTER: BEST PRACTICES

The EPR project is committed to all 5 Open Data Charter[5] best practice principles, in accordance with Federal and Provincial legislation and regulations.

BIG DATA STRATEGIES

Big data that is collected through the Energy Poverty Reduction Program will allow municipal policies makers to make decisions based on real information, enabling them to further improve energy performance, related energy use, mobility and transportation decisions, etc.

PERSONAL DATA AND INFORMATION PRIVACY

PERSONAL INFORMATION FOR ENERGY POVERTY REDUCTION

The Smart Cities Challenge approach uses real-time and actionable data to inform the operation of community-wide systems and services. The Energy Poverty Reduction Program demonstrates the inclusion of measures to protect personal information and privacy and respects the fair information principles.

Personal information is data about an "identifiable individual." It is information that, on its own or combined with other pieces of data, can be used to identify a specific individual. In some circumstances, information that may appear to be non-identifiable may still qualify as personal information if there is a risk of re-identification. See Preliminary PIA for *FOIPOP act* considerations.

Health information in the Energy Poverty Reduction Program can include, items as defined by Nova Scotia's PHIA act. See Preliminary PIA for PHIA act considerations.

The program's information will be combined and analyzed with data from different sources and could become identifiable personal information. To mitigate this risk, the program team will seek to de-identify personal information at the earliest opportunity, and always pursue the least privacy-invasive options wherever possible. See the Preliminary PIA for further details surrounding data consent, data sharing opt-out options, server locations, data ownership and governance, safeguards and transparency.

HOMELESS INDIVIDUALS AND FAMILIES INFORMATION SYSTEM (HIFIS)

The Homeless Individuals and Families Information System (HIFIS) software is owned by Service Canada which it shares nationally with communities to assist services delivery agencies track and report on their efforts, ultimately supporting vulnerable households; those who are homeless or at risk of being homeless. The HIFIS system is undergoing upgrades to a cloud-based system allowing for fluid information sharing between services organizations. Individuals seeking homeless related services, through local service providers, no longer have to repeat their stories multiple-times to each party, as their HIFIS profile is now shared amongst services organizations granted the client provides consent. Two service organizations within the Town currently use HIFIS (Freeman House and Second Story Women's Centre), and it's expected this number will grow as the newest iteration rolls out.

Through attending a HIFIS training session, correspondence with community service organizations, dialogue with the Affordable Housing Association of Nova Scotia (AHANS), and examining research that suggests energy poverty contributes to housing insecurity, the Town has identified HIFIS as being a key component to the Energy Poverty Reduction program. One has the ability within HIFIS to create unique fields and surveys, for specific programs, which can be partitioned off from other community service programs and organizations at the household's request. The Town will create its own survey and fields for the purposes of tracking program outcome indicators.

[5] G8 Open Data Charter: Technical Annex https://opendatacharter.net/g8-open-data-charter/

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Energy meters on the side of an apartment building.

This data platform would reside outside of the Town's municipal services and an agreement would need to be established between the municipality (or to be determined service organization) and AHANS, who has a contract with Service Canada, or Service Canada itself. This would allow our household indicators to be stored on AHANS's HIFISNS Network host (Canada Web Hosting) which meets Federal Government security standards.

The Office of the Information and Privacy Commissioner for Nova Scotia (OIPCNS) has outlined their concerns related to HIFIS . These concerns include creating a more robust view of a household through information gathered by the program and potentially Federal government access to this information. The Town will address these concerns through a Privacy Impact Assessment (PIA) as outlined in the Preliminary PIA.

PRELIMINARY PRIVACY IMPACT ASSESSMENT

To support the selection and design of a comprehensive data management system, the Town of Bridgewater developed a preliminary privacy impact assessment (PIA) for the Energy Poverty Reduction Program. The PIA includes a map depicting all of the program's anticipated data flows for the key project activities: Intake, Service Delivery, and Monitoring and Analytics and qualified their associated security and privacy risks. While developing the preliminary PIA the Town of Bridgewater staff actively consulted with the Office of the Information and Privacy Commissioner (OIPC) of Nova Scotia to ensure that the program design conforms with all applicable privacy laws and best practices. Project staff also worked with the Town's Finance Department and the Municipal Joint Services Board (MJSB – IT Services) to ensure that project IT needs can be met and are compatible with existing services and infrastructures.

Through the PIA, the Town of Bridgewater demonstrates that relevant privacy authorities were consulted, and their guidance was considered during the program and application development. The PIA reviews and supports the Energy Poverty Reduction Program's compliance with relevant municipal, provincial/territorial, and federal privacy regimes.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ENGAGEMENT ACTIVITIES UNDERTAKEN TO DATE

INITIAL APPLICATION PHASE: JANUARY – APRIL 2018

We looked to the public to teach us about energy poverty, their experiences, core concerns, and suggestions on how a Town strategy could reduce energy poverty. Feedback from over 200 residents reinforced public support for reducing energy poverty. The submission of the Town's initial application to Smart Cities Challenge, and its eventual selection as a Finalist, was met by enthusiastic support from the community and our stakeholders, a support that has continued to grow continuously over the course of the Final Application development phase.

FINAL APPLICATION PHASE: JUNE 2018 – MARCH 2019

We produced a comprehensive Community Engagement Plan that identified the project's primary stakeholders and identified the outcomes of the program that were relevant for each group. For each group, it planned a schedule of engagement activities, complete with desired engagement outcomes. The Community Engagement Plan was implemented through the following activities:

1. Energy Poverty Research Program

This program sought to document and better understand the lived experience of energy poverty. It included the following:

Interviews: 20 interviews were conducted, consisting of 12 women and 8 men with a broad age distribution of 18 – 65 and over; 75% of interviewees were renters, 10% lived in affordable housing, and 15% owned their home; and 12 participants received income assistance and 8 did not.

Focus Groups: 57 individuals participated in the focus groups, consisting of 38 females, 16 males, and 2 transgendered females; 45 renters and 11 owners; and 50% of participants were on income assistance.

Key Findings:

- Many individuals living in energy poverty have developed energy management strategies for dealing with their energy burden;
- Several demographics are more at-risk for energy poverty including: single mothers, African Nova Scotians, seniors, and those with health conditions and disabilities;
- Energy poverty has a severe impact on a household's ability to spend on other essential goods and services, forcing trade-off decisions on food, health, and entertainment;
- Residents are highly supportive of long-term community-based solutions which provide greater access to quality housing, affordable energy, and greater mobility options.

The research program provided the opportunity to build early relationships with our eventual clients and include our learning into the program design. To promote involvement, the Town offered an honorarium of $20/hour for program participants.

2. Engagement of Community Stakeholders

Workshops. A series of 8 workshops involved open discussion on almost every component of our application. Over 30 organizations have been represented at workshops, with over 140 representatives in attendance. Some of the key learning outcomes that were achieved through the workshops include:

- Service organizations with a diverse range of mandates identified energy poverty as one of their clients' key challenges and a core service priority;
- Service organizations endorsed addressing the systematic causes of energy poverty;
- Data and connected technology solutions were identified as essential to increasing collaboration and efficiency of resource allocation for service organizations.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Interviews: We undertook 15 one-hour interviews with representatives of partner organizations. From these interviews we learned that:

- Partners have insufficient resources to address the basic energy, housing, and transportation needs of their clients;
- Partners are supportive of a coordinated access system for their clients;
- Spending on energy related services constitutes a large portion of many organization's budgets;
- To reduce costs, there needs to be a shift from spending on emergency services to preventative services.

3. Engagement of the Public at Large

The Town involved a substantial number of individuals by utilizing a range of in-person and online engagement activities.

Youth Video Documentary: The Town worked with the HeartWood Center for Community Youth Development, the Department of Community Services, and Picnic Studios to bring together a video team comprised of 5 youth-at-risk from Bridgewater and area. The youth team created a video documentary called *Living in Energy Poverty* which was premiered at an Open House on January 17, 2019. Parts of the footage was incorporated into the Town's 5-minute Smart Cities Challenge video pitch. The documentary has received regional recognition for how it captured the lived experience of energy poverty and was featured in a CBC Nova Scotia article about energy poverty in Bridgewater.

Community-Wide Paper Survey: A paper survey yielded a total of 585 responses, representing 15% of Bridgewater households. Important program information received through the survey included:

- 38.5% of respondents said that they had difficulty affording energy costs and spent more than 10% of their after-tax income on energy and transportation costs. This indicator will act as a baseline to track our energy poverty rate as part of program performance and measurement.
- Responses were tracked by housing type and neighbourhood, which informed the mix of housing ages, forms, and heating systems used to inform this proposal's financial outcomes and energy analysis.

Thematic Surveys: We received a total of 278 responses from 4 different thematic surveys, covering housing; transportation; health; finances; and employment and training. Some of the key findings from the surveys include:

- 74% of respondents stated that they had faced difficulty paying rent, energy bills, or transportation in the last five years;
- Middle income households can also suffer from energy poverty.

Social Media: Town staff routinely engage residents using social media to answer questions, and provide further information related to the Energize Bridgewater and Smart Cities Challenge programs.

Video and Image Media: 10 videos were produced to document the Town's workshops with partners, engagement with residents, and illustrated the Town's application. This content was shared over the Energize Bridgewater and Town of Bridgewater social media pages. An interpretive exhibit was created that featured quotes shared by participants from interviews and focus groups. The exhibit has been displayed in four locations across town to initiate further engagement with the community on energy poverty.

Open Houses: On January 17, an open house was held for the public at large that premiered the youth video documentary described above. On March 29, a final open house will explain the community's final application to the public.

ENGAGEMENT PRINCIPLES GOING FORWARD

The design of the community engagement approach for the Energy Poverty Reduction Program is founded on 5 principles:

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

1. **Consideration of full-spectrum needs:** engagement efforts will be designed based on an integrated understanding of the needs and aspirations of program clients and partners. This ensures that their voice matters, and that emerging risks and challenges are addressed in a timely fashion. Design and evaluation of engagement efforts will consistently refer to the broad set of desired program outcomes.

2. **Inclusion and accessibility:** these principles will continue to inform the design of the program. Ongoing efforts to understand the needs of clients, use a trauma-informed lens for service design and delivery, evaluate which voices are not being heard, and challenge assumptions and stereotypes, will help meet inclusion goals. The accessibility of the program will also constitute an important evaluation criterion for program partners, in particular the Coordinated Access System and the Housing Energy Improvement System.

3. **Empowerment:** the central purpose of the program is to enhance energy management capability for program clients and throughout the community. This principle extends toward ensuring that program clients have a say in program design, delivery, and evaluation. It is operationalized through engagement structures such as the Client Advisory Circle and the role of the Ombudsperson, continuous feedback from clients and partners, and the use of connected technologies to better access information and communicate needs. For program partners, it means participation in the program governance structure, and through ongoing feedback and evaluation processes.

4. **Consent:** obtaining informed consent to receive program services and to share data is critical for fostering trust and encouraging participation. The Town and its service delivery partners must ensure that clients are appropriately informed about the services that they will be receiving, as well as their rights and responsibilities as clients.

5. **Navigation support:** the provision of extensive navigation services is necessary to help clients overcome difficulty in navigating community and government support systems and bureaucracies. The Household Navigator, working through the Coordinated Access System embodies this principle for households-at-risk, as do the Technical Navigator and Investment Navigator roles for property owners and investors, respectively.

PROGRAM CLIENTS, STAKEHOLDERS, AND ENGAGEMENT TOOLS

Energy Poverty Reduction Program stakeholders are described below, along with engagement objectives and tools that have been tailored to their needs:

Households at Risk of Energy Poverty

Currently estimated at 38.5% of Bridgewater's population, these residents are a primary client of the program. Engagement objectives and tools:

1. ***Ensure that clients' voices and needs are heard as part of the program design and evaluation.*** Engagement activities include representation on the Client Advisory Circle, active participation in program design through focus groups, interviews, surveys, and service testing, and through feedback from program partners who serve these clients.

2. ***Connect clients to the community and energy services they require.*** Engagement activities will be driven by the Coordinated Access System and its Household Navigators. It will provide high quality, accessible services that are designed specifically with an eye to serving the broad range of needs and levels of urgency experienced by households-at-risk. In delivering coordinated access services,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

clients will be educated on their options, rights and responsibilities in sharing their personal data. A Communications Strategy will be developed to attract clients.

3. ***Empower clients to better manage their energy systems.*** Engagement activities will include the provision of energy management services for clients who are also homeowners, and referral of landlords to these services if the clients are renters. A home energy 'dashboard' will be provided to clients, with an ever-growing set of energy management solutions as those become available from the evolving Energy Management Information System and community energy systems. Clients receive energy management training to build their skills and knowledge, and to share with other clients those energy management practices that they have already developed and refined.

Property Owners

Bridgewater property owners whose properties are inhabited by households-at-risk of energy poverty are a primary client of the program. Engagement objectives and tools:

1. ***Ensure that clients' voices and needs are heard as part of the program design and evaluation.*** Engagement activities are the same as for households-at-risk.

2. ***Connect clients to the technical solutions they require.*** Engagement activities will be driven by the Housing Energy Management System and its Technical Navigators. High quality, accessible services will be provided, with attention to the needs of landlords to help them overcome split incentive issues that often complicate energy improvement efforts. Clients will be educated on their options, rights and responsibilities in sharing their personal and property data. A Communications Strategy will be developed to attract program clients.

3. ***Empower clients to better manage their energy systems.*** Engagement activities are the same as for households-at-risk.

Investors

Program capitalization will be achieved by attracting and retaining investments from specialized funders, as well as traditional and community investors. Engagement objectives and tools:

1. ***Ensure that investors' voices and needs are heard as part of the program design and evaluation.*** Engagement activities will centre around direct outreach during the program design and prototyping phases to ensure that program outputs, outcomes, and financial returns represent adequate value for investment.

2. ***Achieve investments for the program.*** Engagement activities will centre around continuous outreach, marketing, and reporting to investors. Investors will learn about investment opportunities and their benefits, including the ability to leverage further funding, and to reduce long-term costs to these agencies through efficiency gains that come from coordinated housing improvements and community services provision. Traditional and community investors require detailed financing prospectus documents to attract their investment interest. Maintaining investor relationships is a key activity for the Investment Navigator and the Financial Investment Vehicle.

Service Delivery Partners

Program governance and service delivery will involve multiple levels of relationships with project partners and service providers. Engagement objectives and tools:

1. ***Develop a strong and committed partner network.*** Engagement activities will involve building on existing relationships with essential program partners such as Efficiency Nova Scotia,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

TownSuite Municipal Software, the South Shore Housing Action Coalition, Family Services of Western Nova Scotia, and others. Stakeholders will continue to advise on goals, metrics, data needs and benefits, use cases for data, budget, policy, operations, end-user needs, and program governance. Partners will be invited to apply to the Energy Poverty Reduction Program Steering Committee and Technical Advisory Committee to support the program's governance and advisory functions as described in the **Governance chapter.** Broad participation from community partners will be required to design the Coordinated Access System and to provide access points throughout the community. Led by the Program Coordinator, ongoing evaluation processes with partners will ensure continued engagement.

2. ***Maintain program quality and manage risks.*** Once program services have started, engagement activities will revolve around quality control and evaluation. All service delivery partners will be involved in the processes described in the **Project Management chapter.** This will extend to engagement with regional trade networks and supply chain capacity building.

Acadia First Nation

The Town of Bridgewater is in Kespukwitk (Land Ends) on the unceded territory of the Mi'kmaw. Acadia First Nation (AFN) is the Mi'kmaw Nation within whose territory Bridgewater is located. Guided by the Community Engagement Plan, Bridgewater Town Council issued a formal expression of interest in 2018 to initiate government-to-government relations with AFN. The Town will **continue to develop this relationship.** Engagement activities will focus on cultural exchange, knowledge transfer, and the identification of partnership opportunities for energy-related initiatives that achieve mutually beneficial outcomes.

Senior Government and Other Communities

The Province of Nova scotia and the Government of Canada have jurisdiction over legislation, regulations, policies, and programs that influence energy poverty risk factors for Bridgewater residents as well as for other communities. Engagement objectives and tools:

1. ***Inspire positive change across the Province and the country.*** Engagement activities will be centred on knowledge transfer and advocacy, so that energy poverty solutions developed in Bridgewater can achieve broader systems-level impact. Participation in the Smart Cities Challenges offers a powerful platform to do so.
2. ***Inspire energy poverty reduction actions in other communities.*** Engagement activities will be centred on knowledge transfer. The Town will also use its regional networks and its membership in the Federation of Canadian Municipalities to achieve these ends.

General public

The community of Bridgewater at large, plus surrounding communities, will have ongoing interest in the program, and receive direct and indirect benefits from it. Engagement objectives:

1. Openly communicate program outcomes and benefits to the community.
2. Receive feedback on broader program benefits and outcomes.

MONITORING AND EVALUATION

The evaluation processes described in the **Performance Measurement chapter,** and the quality control and risk management processes described in the **Project Management chapter** will ensure that that outputs and outcomes associated with stakeholder engagement are monitored and evaluated on an ongoing basis. Program risks associated with engagement efforts are identified in the **Project Management chapter.**

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

IMPLEMENTATION PHASE REQUIREMENTS

MODERN TREATY OBLIGATIONS AND DUTY TO CONSULT WITH INDIGENOUS GROUPS

The Town of Bridgewater received confirmation through the Nova Scotia Office of Aboriginal Affairs that The Town is not required to consult with the First Nations in this province at the application stage of this project. The Town has consulted with Acadia First Nations based on Duty to Consult principles and as a good governance practice in accordance with the *Government of Nova Scotia Policy and Guidelines: Consultation with the Mi'kmaq of Nova Scotia*. The Town intends to undertake further consultation and build a partnership with Acadia First Nations regardless of the outcome of the application.

COMMUNITY EMPLOYMENT BENEFIT

The Town will be participating in the Community Employment Benefit Initiative. In order to do so, the Town will create a Community Employment Benefit policy to guide training, hiring, and procurement processes. The policy will result in a revision to our existing HR and Procurement Policies which do not yet include the principles of the Community Employment Benefit Initiative.

The Town will identify employment and procurement opportunities for three groups targeted by the initiative soon after the funding decision is made. Through feedback we received in consultation of residents and partner organizations, the Town is already aware of several groups who could be identified for employment and procurement opportunities.

No one individual can be held accountable, but we can hold a community accountable.
– RESIDENT, TOWN OF BRIDGEWATER

The Town will adhere to the following plan in the selection of the employment and procurement opportunities:

1. The Town will consult with community partners to come to a consensus on the needs of employment and procurement opportunities for the inclusion of those who are traditionally underrepresented.
2. A needs assessment will be undertaken to identify employment opportunities.
3. The town will develop partnerships for resident recruitment through partner organizations.
4. Measurable indicators will be created to monitor progress.
5. Dispute resolution mechanisms will be drafted.
6. A reporting framework will be created.

CLIMATE LENS ASSESSMENT

The Town of Bridgewater is not required to undertake a Climate Lens Assessment for the purposes of this application because we are in the $5 million prize category. Even so, a key focus of the Town's application is on a reduction in GHG emissions. The Town quantified and set targets for GHG emissions reductions of 80% by 2050 in our 2018 Community Energy Investment Plan (CEIP). The Plan provides guidance for many climate mitigating project outcomes and details their climate impacts. The Town was one of only two communities in Atlantic Canada who submitted to the Carbon Disclosure Project (CDP) in 2018 and received an overall score of B, higher than the regional and global averages.

Community stakeholders watching a presentation at a Smart Cities Challenge workshop.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)

[redacted]

The project will draw on a wide array of partners and stakeholders who are working at the ground level on poverty reduction, transportation, and employment to identify opportunities for shared solutions.

– COMMUNITY SERVICES ORGANIZATION REPRESENTATIVE

OTHER APPLICABLE LAWS, REGULATIONS AND POLICIES

FEDERAL POLICY

- **Reaching Home: Canada's Homelessness Strategy** Bridgewater's proposed outcomes for the provision of affordable, secure housing is closely aligned with *Canada's Homelessness Strategy*. The Town will utilize Employment and Social Development Canada's Homeless Individuals and Families Information System (HIFIS) software as the data platform for our Coordinated Access system.

- **A Place to Call Home: Canada's National Housing Strategy (2018)** Our project aligns with the Government of Canada's National Housing Strategy with activities aimed at providing preventative actions for reducing homelessness, helping households to find suitable housing and ensuring housing remains affordable.

- **Opportunity for All: Canada's First Poverty Reduction Strategy (2017)** Our project aligns with the Government of Canada's commitment to reducing poverty by 50% by 2030. In many ways, the Town's Energy Poverty Reduction Program mirrors the approach being taken nationally but with a more specific focus on the energy element of poverty and a course of action that is meaningful, measurable and monitored.

PROVINCIAL LEGISLATION AND POLICY

- **Municipal Government Act** As a municipal unit will operate in accordance with legislation laid out in the Nova Scotia Municipal Government Act and related regulations.

- **Housing Act** The Town of Bridgewater will develop policies in accordance with the legislation.

- **Building Code Act** The Housing Energy Management System within the Energy Poverty Reduction Program will adhere, at minimum, to the requirements set out in the Act and related regulations.

- **Access by Design 2030 Achieving an Accessible Nova Scotia:** The Town is aligned with the Act's acknowledgement that accessibility is a human right and through our Mobility Improvement System.

- **The 2005 Environmental Goals and Sustainable Prosperity Act (EGSPA)** Our proposal aligns with goals on sustainable prosperity, such as emission reduction, energy efficiency programs, climate change adaptation and improving the Province's environment and economy for future generations.

- **Nova Scotia's Electricity Plan 2015-2040** Our conforms with key themes of Nova Scotia's Electricity Plan to ensure stable electricity prices for residents, create innovative energy systems that promote customer control, integrate systems, and increase the value of renewable energy resources in home heating and transportation.

- **A Housing Strategy for Nova Scotia (2013)** Our aligns with and supports the Province of Nova Scotia's goal to ensure that Nova Scotians can find the housing choice that's right for them and their families, at a price they can afford, in a healthy, vibrant community that offers the services, supports and opportunities they need.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information Page 896 of 1849

INTRODUCTION

For Bridgewater to lift 20% of its residents out of energy poverty in 10 years, $89.8 million dollars needs to be invested into the community. The $5 million prize of the Smart Cities Challenge is just a fraction of the overall cost but is the catalyst that will enable the Town to make this bold step forward to ensure no family is left behind. It is also an investment in the shift required to achieve a clean, efficient, affordable and secure energy future for our community.

By the end of the Smart Cities Challenge program in 2025, our community will have been the recipient of $45.7 million worth of investments in housing, transportation, community energy systems, and community services. As Table 9.1 indicates, that will increase by another $44.1 million over the next 5 years as the program matures through years 6-10. The large majority of these investments relate to 'hard' costs and come with financial returns (labeled "with ROI" in the tables and charts in this chapter). By undertaking strategic de-risking activities, and leveraging the power of connected technologies such as home energy monitoring systems, Bridgewater will be able to bundle these investment opportunities and make them attractive to a diverse group of investors. Pooled capital implements the energy poverty reduction solutions described in the previous chapters, which systematically lifts Bridgewater residents out of energy poverty. These capitalization activities are explained in detail later in this chapter.

To deliver on these opportunities, the Energy Poverty Reduction Program will incur $5.42 million in core operating costs over the first 5 years. These costs consist of program development, operations, and administration. They can be offset by the $5 million Smart Cities Challenge grant, which acts as a catalyst that allows the community to leverage the additional $40.3 million over that same timeframe, an investment leverage ratio of 1:8 for the grant. The remaining core operating cost can be achieved with an in-kind contribution of $420,000 from the Town of Bridgewater. As indicated in Table 9.2, 2.6% of the Smart Cities Challenge grant would be held in reserve as a contingency. If unused, this amount can help subsidize home energy improvements for program participants.

> Through our proposed solutions, we will make sure those among us who are most vulnerable and least able to afford the transition, are the first ones we help across the threshold. Those residents have the most to lose and through the betterment of their lives, our community has everything to gain. – MAYOR MITCHELL

Energy Poverty Reduction Program Total Costs by Activity for Each Program Year

Program	Activity	2020-21	2021-22	2022-23	2023-24	2024-25	Years 1-5 Total	Years 6-10 Total	Grand Total
Sub-Totals	Program Development	$1,295,000	$700,350	$128,778	$130,710		$2,254,838		$2,254,838
	Program Operations & Administration	$207,500	$624,225	$691,539	$750,274	$890,219	$3,163,756	$4,385,043	$7,548,799
	Capital Planning & Improvements- No ROI		$1,185,013	$1,452,617	$1,905,749	$2,366,841	$6,910,219	$14,693,023	$21,603,242
	Capital Planning & Improvements- With ROI		$1,731,945	$9,199,368	$11,015,163	$11,442,793	$33,389,270	$25,012,945	$58,402,215
	Total	$1,502,500	$4,241,533	$11,472,302	$13,801,896	$14,699,852	$45,718,084	$44,091,010	$89,809,094

Capitalization by System for Each Program Year

System	Capitalization by Program Year					
	2020-21	2021-22	2022-23	2023-24	2024-25	Total
Overall Program Management	$157,500	$139,563	$131,354	$133,324	$214,926	$776,666
Housing Energy Management System - Operations	$422,500	$406,000	$282,024	$305,861	$197,679	$1,614,064
Community Energy Systems	$387,500	$185,238	$43,785	$44,441	$45,108	$706,071
Mobility Improvement System	$83,750	$54,556	$14,166	$14,378	$14,594	$181,444
Investment System	$225,000	$274,050	$146,807	$162,080	$177,778	$985,716
Coordinated Access System	$120,000	$157,325	$92,720	$109,796	$127,364	$607,205
Contingency (2.6%)						$128,834
Total	$1,396,250	$1,216,731	$710,855	$769,881	$777,449	$5,000,000

Table 9.2

A detailed breakdown of all program costs, including the line items that make up the core operating costs, are described in detail in the tables that follow in this chapter.

FINANCIAL CONTROLS AND STANDARDS

The accounts of the Town of Bridgewater are kept and reported on in accordance with Generally Accepted Accounting Principles adopted for Nova Scotia Municipalities as defined in the Financial Reporting and Accounting Manual (FRAM) prescribed by the Minister of the Department of Municipal Affairs and as outlined in the Canadian Public Sector Accounting Standards. The Town undergoes an annual external audit by a Registered Municipal Auditor as defined in Section 457 of the Nova Scotia Municipal Government Act. The accounts for the Energy Poverty Reduction Program, as a program of the Town of Bridgewater, will adhere to these same financial controls and standards.

In accordance with municipal accounting principles, projected program expenditures by the Town of Bridgewater are inclusive of municipal net of HST. To account for general inflation, conservative cost escalation of 1.5% per year has been built into each year of the program, starting with 0% inflation in fiscal year 2020-21, and increasing by 1.5% per year, compounded annually.

COST OF SERVICES

COORDINATED ACCESS SYSTEM

Estimated service costs for the Coordinated Access System are presented in Table 9.3. Cost assumptions were developed in consultation with community partners who are familiar with the delivery and cost of community support services. In particular the local delivery of housing support services by Family Services of Western Nova Scotia was used as the basis of the Coordinated Access Service Provision. As the Homeless Individuals and Families Information System (HIFIS) is a free service, database set up costs relate to the design and programming of data entry templates and reports by program staff. Service costs to clients were calculated using an annual cost per client of approximately $600 per year, plus inflation. These services are projected to be delivered by 1.5FTE (full time equivalent) social workers for the first three years of the program, and by 2.0FTE social workers from 2023-24 onward. These program staff also account for the majority of the program design, partnership development and coordination, and program evaluation and improvement work. In-kind provision of office space has not been accounted for in this model, as we assume that service providers will be able to provide those needs.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Cost of Services for Coordinated Access System

Program	Activity	Cost Type	2020-21	2021-22	2022-23	2023-24	2024-25	Years 1-5 Total	Years 6-10 Total	Grand Total
Partnership Coordination	Partnership development	Program Development	$20,000	$10,150				$30,150		$30,150
	Partner coordination	Program Operations & Administration		$10,150	$10,302	$10,457	$10,614	$41,523	$55,505	$97,027
	Program evaluation & improvement	Program Operations & Administration	$20,000	$20,300	$20,605	$20,914	$21,227	$103,045	$111,009	$214,054
Coordinated Access Service Provision	Detailed program design	Program Development	$50,000	$50,750				$100,750		$100,750
	Staff hiring & training	Program Development	$10,000	$10,150				$20,150		$20,150

Table 9.3

HOUSING ENERGY MANAGEMENT SYSTEM – FINANCIAL SUMMARY

Estimated service costs for the Housing Energy Management System are presented in Table 9.4. Cost assumptions were developed in consultation with community partners and with energy service providers including Efficiency Nova Scotia and Clean Foundation, who deliver related programs in the Bridgewater area. Data platform development and maintenance costs were assumed to involve the development of the main components of the Municipal Enterprise Resource Planning platform and the Energy Management Information System (EMIS), and calculated based on market information from Bridgewater's current Municipal Enterprise Resource Planning provider, TownSuite, and from industry sources. Technical navigation services for clients and service and supplier procurement and coordination costs are calculated at $500 and $250 per client per year, respectively, plus inflation. These services are projected to be delivered by 2.0FTE (full time equivalent) technical staff plus 1.0FTE information technology staff. These program staff also account for the majority of the program design, partnership development and coordination, community engagement, program administration, and program evaluation and improvement work, and provide a share of their services to the other program service areas. Capital planning and improvement costs for housing retrofits and new construction are detailed in Tables 9.4, 9.5, 9.6, and 9.7.

Table 9.4

A heat pump condenser on the side of a home.

HOUSING ENERGY MANAGEMENT SYSTEM – HOUSING RETROFITS

Table 9.5 provides the estimated breakdown of the 318 target homes to be served through the Housing Retrofit program. Homes are divided into 13 common 'archetypes', defined by the combination of building form, sub-type, age, and type of heating system. Archetypes are defined in detail in Bridgewater's Community Energy Investment Plan. The combination of archetypes represents as closely as possible the housing type distribution of Bridgewater households who reported living in energy poverty in a community-wide survey issued early in 2019. Actual participation rates may vary from this distribution, depending on program enrolment.

Social investing is giving both the community and traditional investors a choice to invest in social outcomes that are of interest to them.

Table 9.5

Table 9.6 provides a breakdown of the capital planning and improvement costs for the 318 homes that are projected to enroll in the Housing Retrofit program. Unit costs for most line items, including those with and without any financial return on investment (ROI) were estimated based on existing housing retrofit programs including the Clean Energy Financing, Clean Net Zero, and HomeWarming programs. Smart thermostat, smart submeter, and home energy dashboard costs were estimated by energy consulting firm Green Power Labs.

An old Bridgewater home converted into a multi-unit residential apartment building.

Cost of Services for New Construction Activities by Program Year

New Construction Activity	Cost Type	2020-21	2021-22	2022-23	2023-24	2024-25	Years 1-5 Total	Years 6-10 Total	Grand Total
Assessment & Planning	No financial ROI		$5,075	$7,212	$9,411	$11,675	$33,373	$75,536	$108,908
Incremental Cost increase - Lighting	With financial ROI		$406	$577	$753	$934	$2,670	$6,043	$8,713
Incremental Cost increase - Appliances	With financial ROI		$10,150	$14,423	$18,822	$23,350	$66,745	$151,071	$217,817
Incremental Cost increase - Envelope - Thermal	With financial ROI		$50,750	$72,116	$94,111	$116,750	$333,727	$755,356	$1,089,083
Incremental Cost increase - Solar Domestic Hot Water	With financial ROI		$17,763	$25,241	$32,939	$40,862	$116,804	$264,375	$381,179
Incremental Cost increase - Solar Photovoltaic	With financial ROI		$35,525	$50,481	$65,878	$81,725	$233,609	$528,749	$762,358
Incremental Cost increase - Smart Thermostat	With financial ROI		$5,075	$7,212	$9,411	$11,675	$33,373	$75,536	$108,908
Incremental Cost increase - Smart Submeter + Home Energy Dashboard	With financial ROI		$2,538	$3,606	$4,706	$5,837	$16,686	$37,768	$54,454
Total			$127,281	$180,866	$236,031	$292,809	$836,987	$1,894,434	$2,731,421

Table 9.8

COMMUNITY ENERGY SYSTEMS

Estimated service costs for the Community Energy Systems are presented in Table 9.9. Cost assumptions were developed in consultation with energy development consultants, in particular engineering consultants Roswall Inc. Costs are 100% external to the organization – no staffing is included in these figures as program staffing that supports this service is in part already included through the Technical Navigator positions, and in part is discounted from the cost model. Data platform development and maintenance costs were assumed to be incremental to development of the main Municipal Enterprise Resource Planning platform and the Energy Management Information System (EMIS), and calculated based on market information from Bridgewater's current Municipal Enterprise Resource Planning provider, TownSuite, and from industry sources. Construction of the 6MW of solar garden capacity was costed at $2.20, $2.00, and $1.80 per installed watt for 2022-23, 2023-24, and 2024-25 respectively, inflated according to the number of years past 2020-21.

MOBILITY IMPROVEMENT SYSTEM

Estimated service costs for the Mobility Improvement System are presented in Table 9.10. Cost assumptions were developed in consultation with Town of Bridgewater public transit and active transportation planning, engineering, and operations staff. Data platform development and maintenance costs were assumed to be incremental to development of the main Municipal Enterprise Resource Planning platform and the Energy Management Information System (EMIS), and calculated based on market information from Bridgewater's current Municipal Enterprise Resource Planning provider, TownSuite, and from industry sources. Program design, partnership development, community engagement, program administration, and program evaluation and marketing services are projected to be delivered by 0.25FTE (full time equivalent) transportation planning staff. Capital planning and improvement costs for public transit improvements are based on current operating data, and costs for active transportation improvements are based on current infrastructure construction costs.

Table 9.11

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

INVESTMENT SYSTEM

Estimated service costs for the Investment System are presented in Table 9.11. Cost assumptions were developed in consultation with investment industry experts and investment platform providers including Tapestry Community Capital and MaRS Centre for Social Innovation. Data platform development and maintenance costs were assumed to be incremental to development of the main Municipal Enterprise Resource Planning platform and the Energy Management Information System (EMIS), and calculated based on market information from Bridgewater's current Municipal Enterprise Resource Planning provider, TownSuite, and from industry sources. Program design, partnership development, project financial planning, funding efforts, reporting to funders, and program evaluation and improvement are projected to be delivered by 1.0FTE (full time equivalent) financial staff.

OVERALL PROGRAM MANAGEMENT

Estimated service costs for Overall Program Management are presented in Table 9.12. Cost assumptions were developed based on prior experience with program design and management. Program governance, management, risk management and quality control, and performance measurement and evaluation are projected to be delivered by 1.5FTE (full time equivalent) program staff.

Cost of Services for Overall Program Management by Sub-Program for each Program Year

Sub-Program	Activity	Cost Type	2020-21	2021-22	2022-23	2023-24	2024-25	Years 1-5 Total	Years 6-10 Total	Grand Total
Program Governance, Management, and Evaluation	Program governance setup	Program Development	$50,000					$50,000		$50,000

CAPITALIZATION OF SERVICES

CAPITALIZATION BY SOURCE

Service capitalization is projected to be achieved from three distinct funding streams:

1. **No investor:** non-debt and non-grant revenues consist of user fees and in-kind or donated services, material, and labour. User fees apply to the Housing Energy Management System and represent a combination of property owner up-front investment into their own property, and payment of administration fees to sustain program operations. User-pay ratios for home energy improvement programs in Nova Scotia range from 0% (HomeWarming Program) to around 50% (Clean Net Zero) with the majority of energy retrofits programs capitalizing upwards of 80% of program costs. However, there are no existing programs that provide greater than $20,000 in financing or funding for single family homes, and only limited program dollars for multi-unit buildings. User fees apply to the Investment System as administration fees can be leveraged on investment raises. In-kind material and services can be expected for the Coordinated Access System and Housing Energy Management System as there is ample opportunity to fundraise for these services within the local community.

> People have to make difficult decisions about what to pay, phone, energy bill, arrears, there is difficulty about what to pay for at each point in time, which is compounded in the winter, it impacts their social well-being and mental health.
>
> – COMMUNITY SERVICE ORGANIZATION

2. **Financial investor:** capital raises from investors that require dividends or interest to be generated from their investments, which means that financed activities must generate a positive return on investment (ROI). ROIs apply to community energy systems and ROI components of housing retrofits and new construction. Overall program management may need to charge an administrative fee to cover expenses once Program Maturity (Phase 4) is reached. Financial investors also includes energy performance contractors.
3. **Specialized investor:** funding from organizations that do not expect a financial return on their investment and instead expect to achieve social impact or other public benefit. Includes issuers of loan guarantees, provincial energy rebates and incentives, philanthropic charitable and non-profit funding, Provincial and Federal government funding including the Smart Cities Challenge, and municipal funding and in-kind contributions.

A Bridgewater resident views an exhibit on energy poverty at a Smart Cities Challenge Open House.

Capitalization projections by service area are provided in Table 9.13. Projections are separated into years 1-5 (within the Smart Cities Challenge timeframe) and years 6-10 (Program Maturity). Further explanations on capitalizations projections by program service are provided in the following sections.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Capitalization by Source

Table 9.13

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

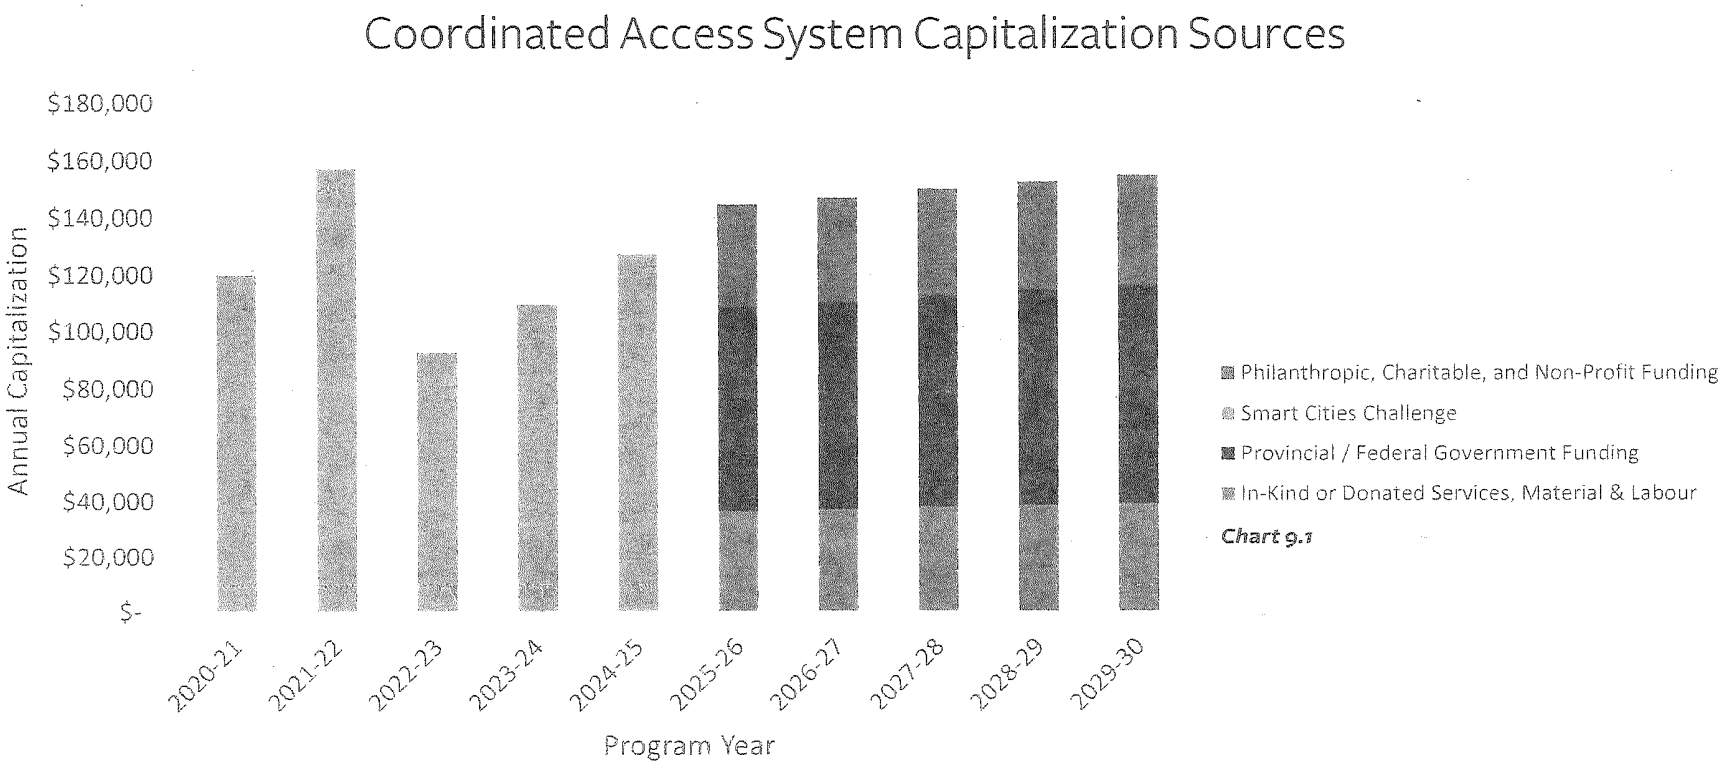

Chart 9.1

As seen in Chart 9.1, we propose that the Coordinated Access System receive 100% of its development and operating funding from the Smart Cities Challenge grant in years 1-5. This amounts to $607,205. This allows the program to be designed and prototyped with little to no financial risk to it, thereby allowing it to demonstrate its value to the community and to other funders, while protecting services for its clients for a 5-year duration. After the Smart Cities Challenge timeframe, service funding would be expected from in-kind or donated services (25%), senior government grant funding (50%) and philanthropic or charitable funding (25%). As a community service with no own-source revenue potential, government and charitable funding would be required to sustain the service over the long term. Our proposition is that the public benefit conferred by the service in saved health care, protective services, legal, and social service costs through mitigated social harms would far outweigh the cost of funding the service, thereby supporting this social investment on rational macroeconomic grounds.

So much money can be saved upfront by providing coordinated access to service

– COMMUNITY SERVICE ORGANIZATION

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

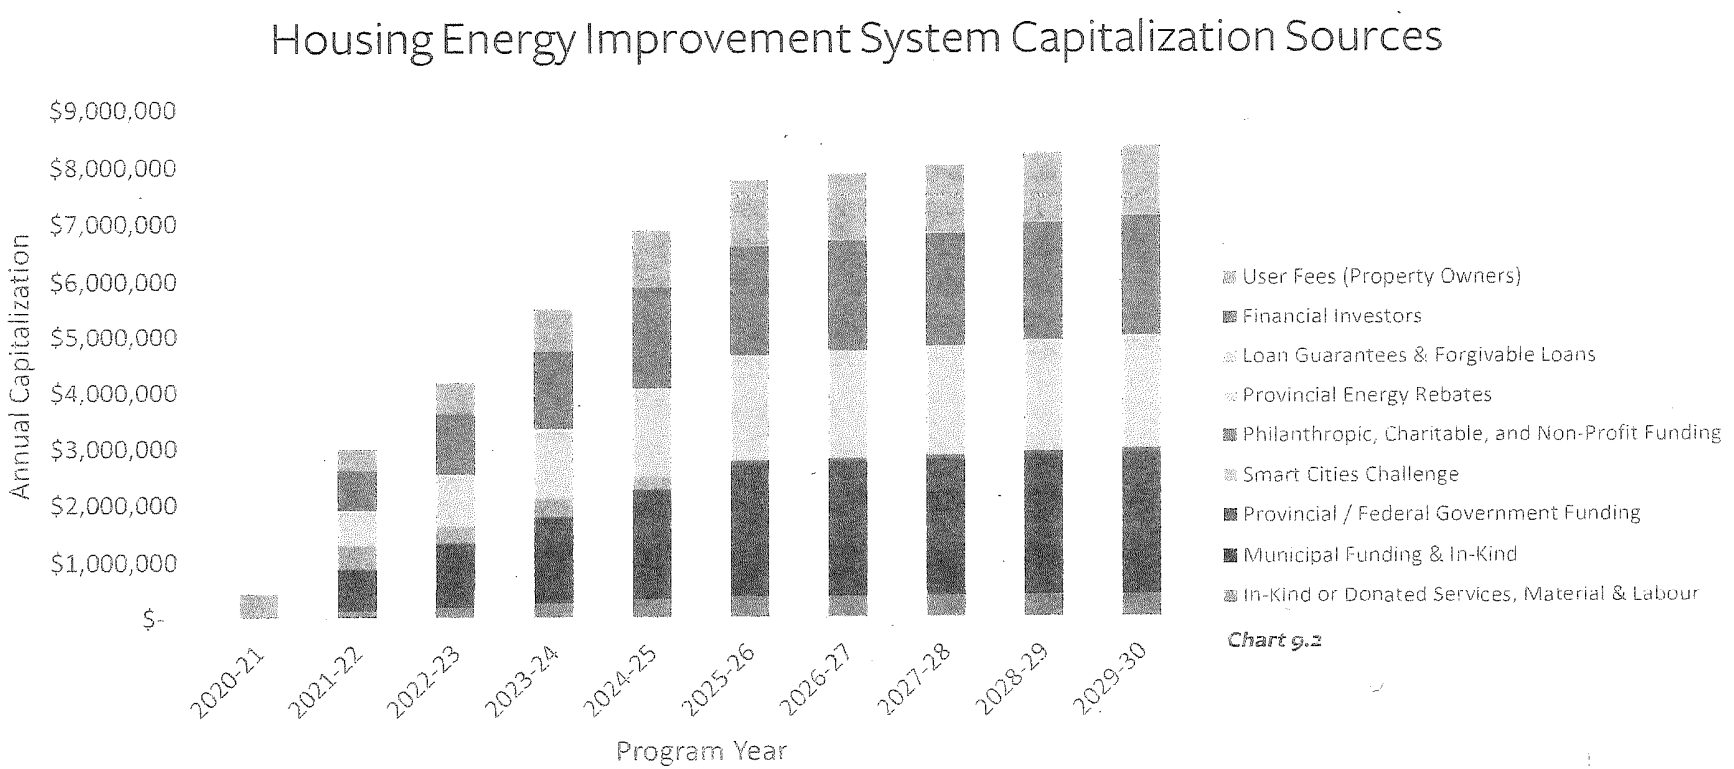

Chart 9.2

As seen in Chart 9.2, we propose that the Housing Energy Improvement System receive its development and operating funding from the Smart Cities Challenge grant in years 1-5. This amounts to $1,614,064 and represents the most substantial use of the grant, with a large focus on data platform development. Starting in year 2 (2021-22), early prototyping begins with participating property owners, enabling the stacking of other funding and financing sources.

The service is able to make use of a blend of financial investments and specialized funding, which accounts for its unique capitalization potential. Substantial specialized funding exists to support the program, in the form of energy efficiency rebates from Efficiency Nova Scotia and solar install rebates from the Province (modelled at a conservative total of $10,000 per participating home). The Province also provides specialized funding for deferred maintenance improvements to low income homes, and capitalizes improvements to Housing Nova Scotia's public housing stock, unit costs for which are included in this calculation. Financial investors are projected to find favourable investment opportunities by contributing around 25% of the capital improvements that create a direct return on investment. Accounting for some allowance for forgivable loans, loan guarantees, and in-kind funding through community fundraising for low-income housing improvements, the remaining 15% of capital is projected

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

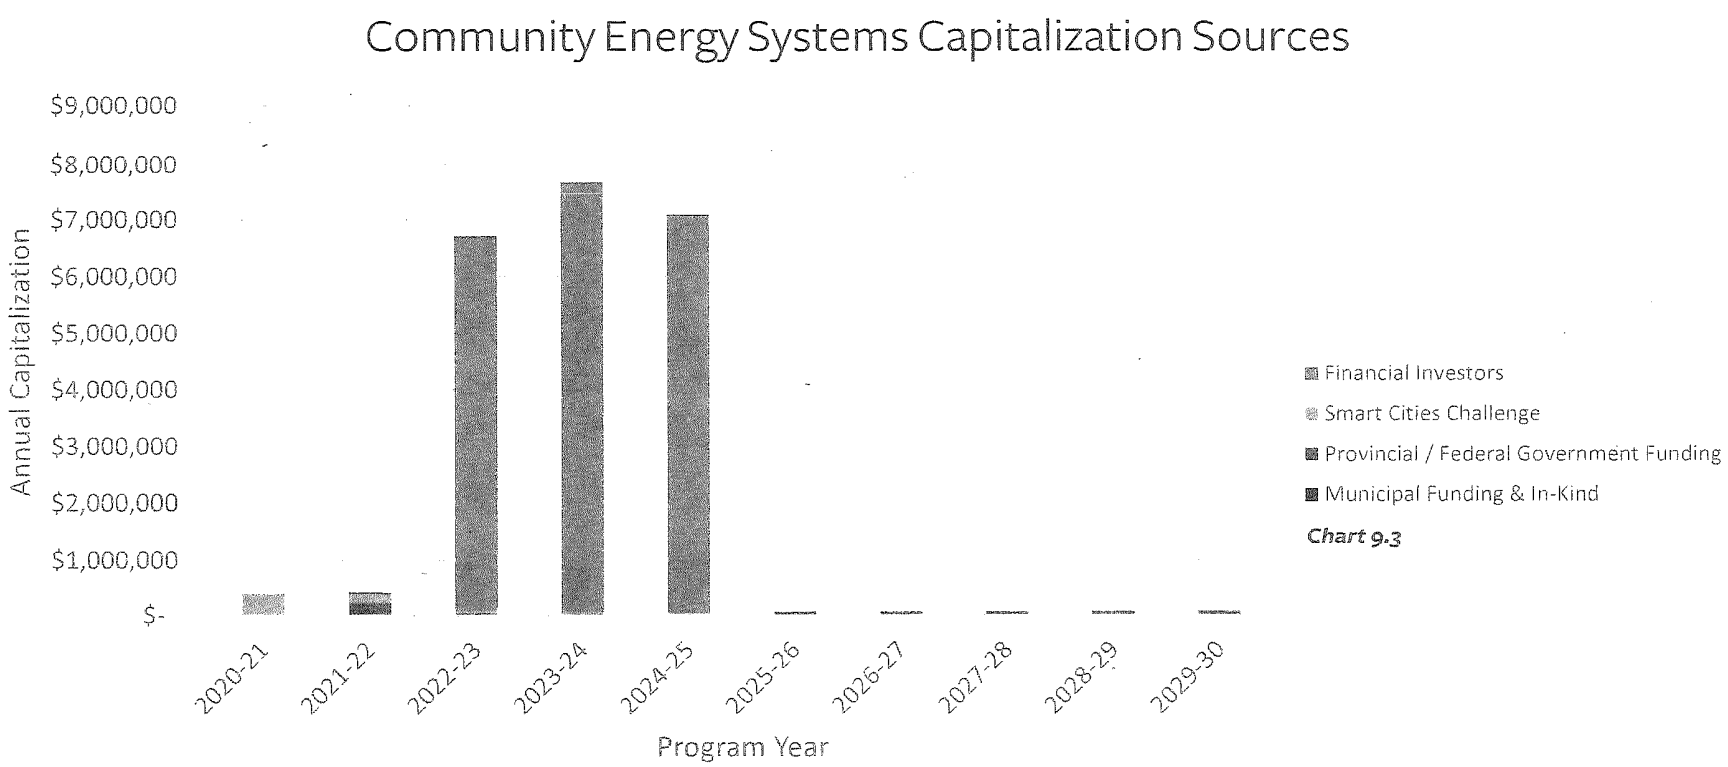

Chart 9.3

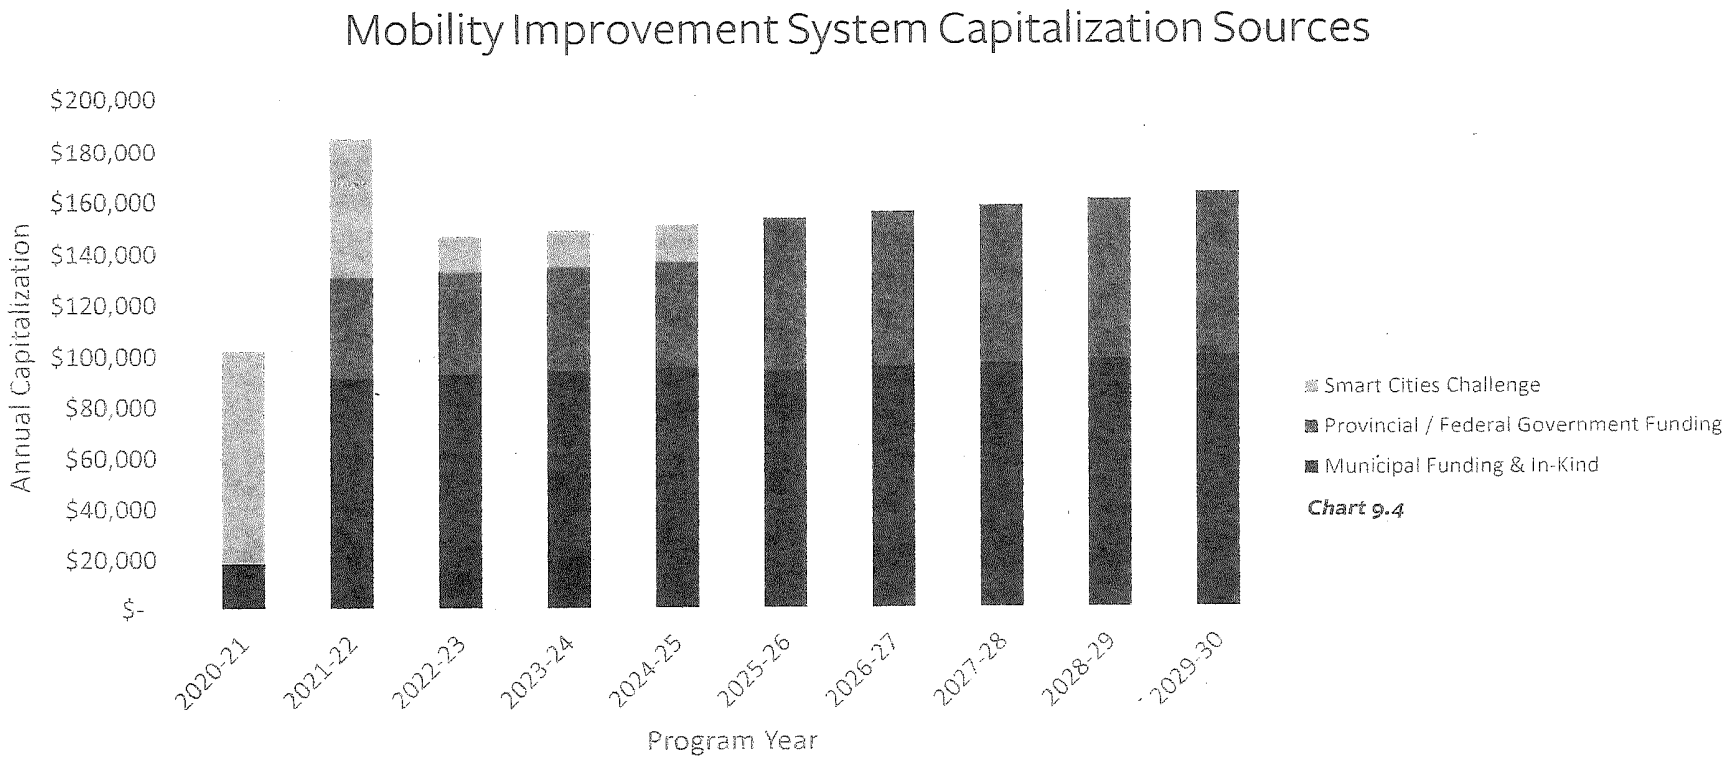
to come from property owners as a combination of own funds and administrative fees. After the Smart Cities Challenge timeframe, service capitalization ratios would be expected continue as before, but without the Smart Cities grant.

As seen in Chart 9.3, we propose that the Community Energy Systems receive its development and operating funding from the Smart Cities Challenge grant in years 1-5. This amounts to $706,071. Additional de-risking funds are projected to come from senior levels of government, which have already funded Bridgewater's community energy initiatives and have indicated continued interest in doing so. Other than some municipal in-kind contribution for program administration, 100% of remaining capital would be sourced from financial investors who could receive ongoing interest payments and/or dividends on their energy investment.

Smart Cities Challenge Open House.

Processed under the provisions of the Access to Information Act/Révisé en vertu de la Loi sur l'accès à l'information



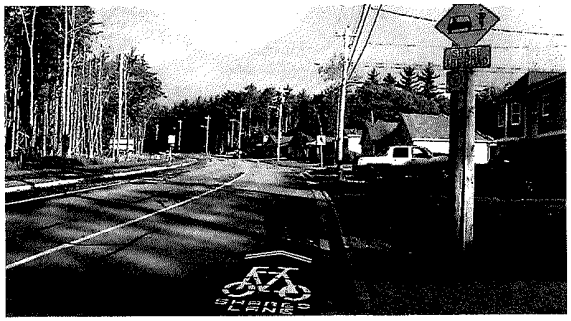


Chart 9.4

A shared bike lane on a residential street in Bridgewater.

After the Smart Cities Challenge timeframe, it is anticipated that the development of community energy systems would continue, with a similar patterns of capitalization: government de-risking activities followed by private-sector investment.

As seen in Chart 9.4, we propose that the Mobility Improvement System receive its development and operating funding from the Smart Cities Challenge grant in years 1-5. This amounts to $181,444. As the Town of Bridgewater's transit and active transportation systems fall under municipal purview, and investments in these systems typically do not yield financial returns, government funding is required to maintain service improvement efforts. Bridgewater has been successful in achieving transportation funding from the Province in recent years, and expects that 25-40% of transportation capital can come from these sources in the long run.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information
Page 915 of 1849

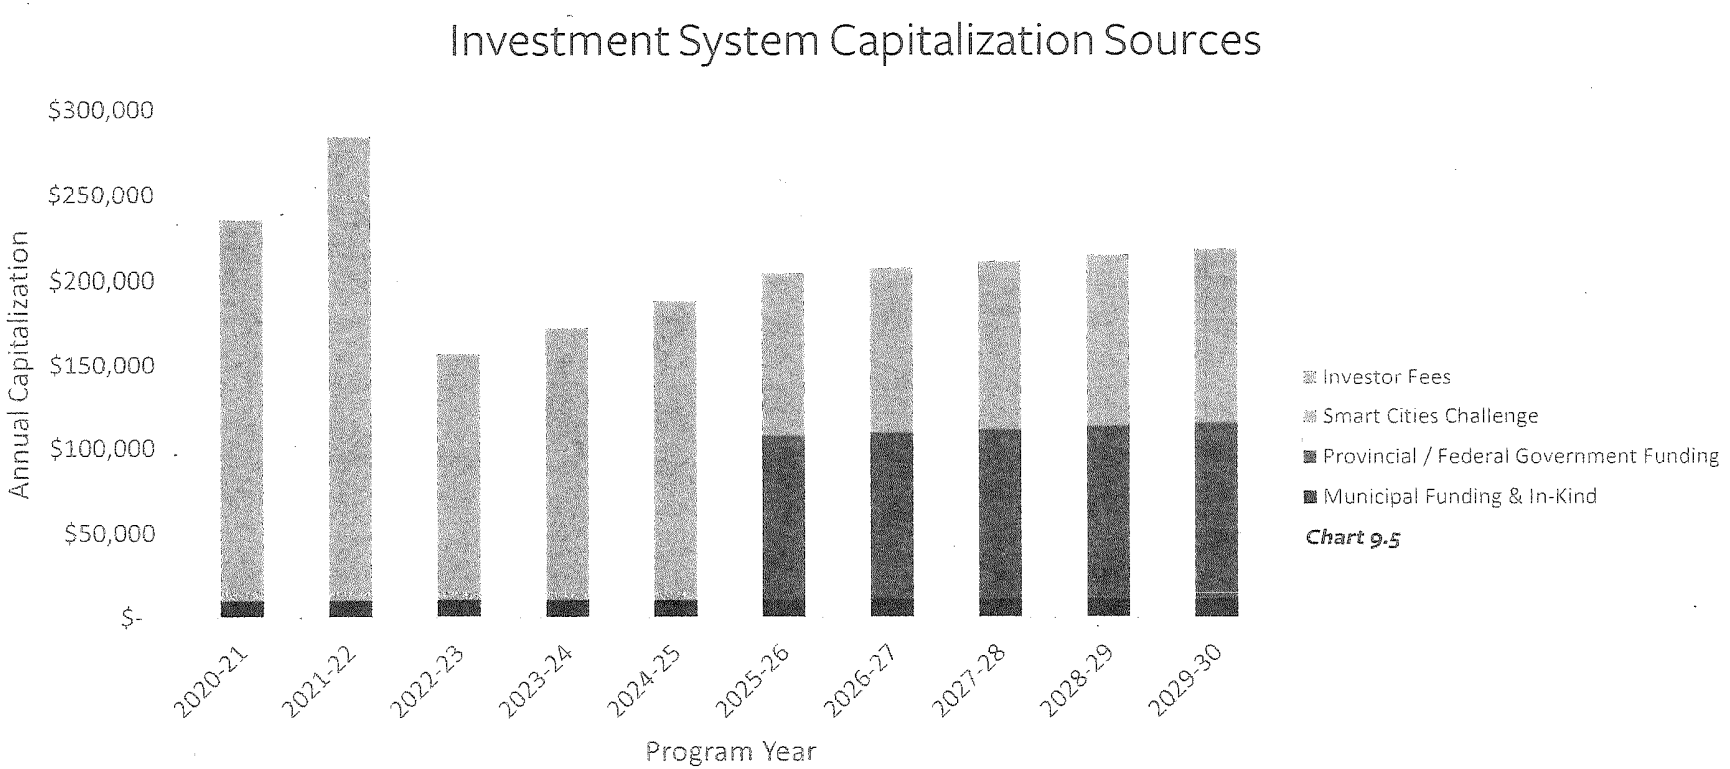

Chart 9.5

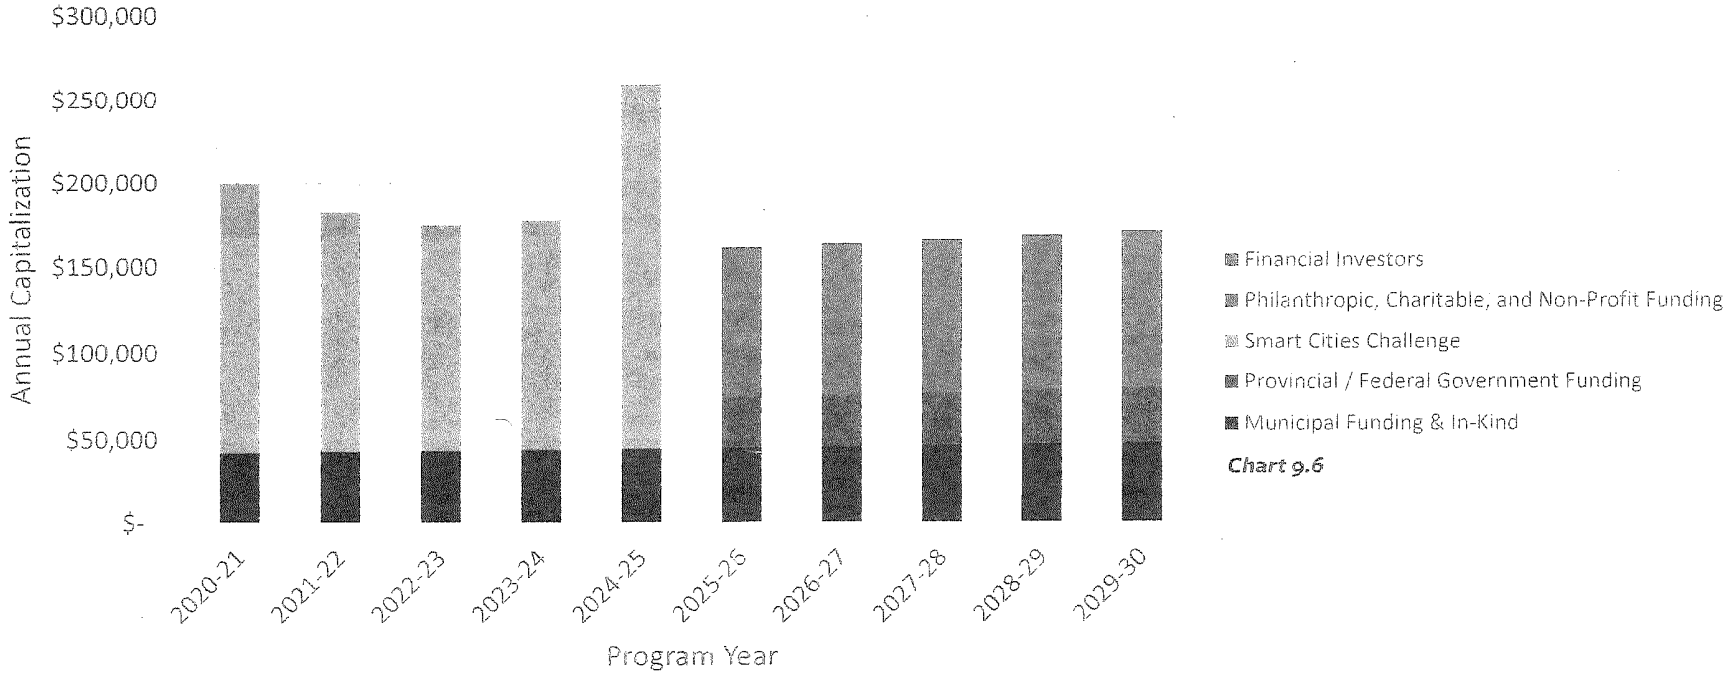
A contractor marks lines on a board of rigid insulation.

As seen in Chart 9.5, we propose that the Investment System receive its development and operating funding from the Smart Cities Challenge grant in years 1-5. This amounts to $985,716, representing 95% of costs, with municipal in-kind providing the remainder. This pattern would continue for the 5 years of the Smart Cities Challenge. After that timeframe, service funding is projected to come from a combination of senior government funding to provide core operating funding to the system, supplemented with user fees collected from investors and funders.

> I asked for weather-stripping and all my landlord did was take it from their door and put it on mine.
>
> – BRIDGEWATER RESIDENT

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Overall Program Management Capitalization Sources



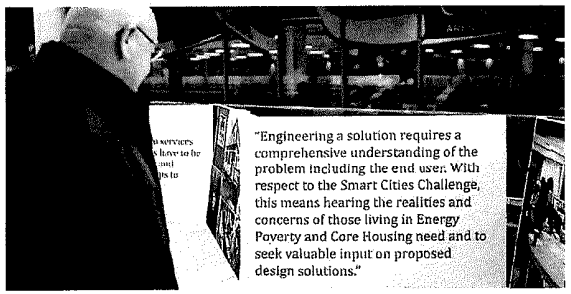


Chart 9.6

As seen in Chart 9.6, we propose that Overall Program Management receive its development and operating funding from the Smart Cities Challenge grant in years 1-5. This amounts to $776,666, representing 78% of costs, with municipal in-kind providing the remainder. This pattern would continue for the 5 years of the Smart Cities Challenge. After that timeframe, service funding is projected to come from a combination of municipal, senior government, and philanthropic funding, with and opportunity to explore subsidization by financial investors.

Last year power bill skyrocketed, you have to find ways, I paid rent and energy bill and put everything else on credit

– BRIDGEWATER RESIDENT

Page 917 of 1849

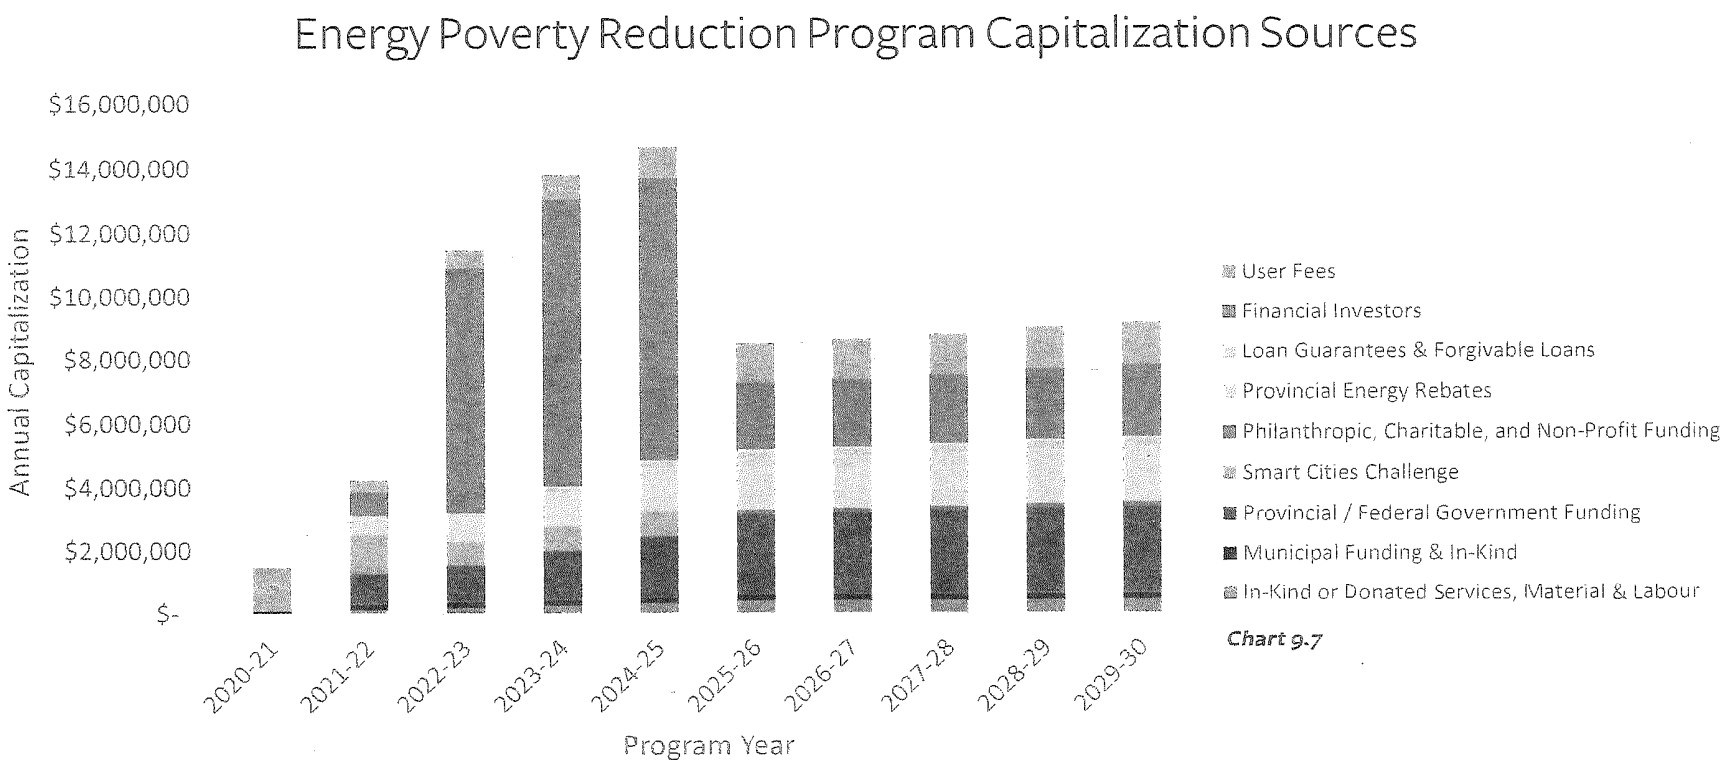

Chart 9.7

In summary, as seen in Chart 9.7, the Smart Cities Challenge grant would fund $5 million (11%) of the Energy Poverty Reduction Program in years 1-5. A diverse set of projects, with a large share of improvements that generate a positive return on investment, enables the stacking of funding and financing sources for years 2 onward. We proposed that this is a sustainable funding model for a town or a rural community, and that this same capitalization concept can be deployed throughout the Canadian context to achieve the program objectives presented in this application.

Capitalization Strategies

Community energy projects typically require upfront capital expenditures resulting in competing priorities, investment risks, layers of operating and ownership entities, all captured within a convoluted business model. Fortunately, as the world transitions to a clean energy economy and technology catches up with societal demand, financing mechanisms are evolving to support low carbon initiatives, and communities across the globe are beginning to share resources, learning experience, and innovative models.

The Town aims to further the aforementioned financial advancements by introducing a replicable model that uses existing tools and

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

considers access barriers. The financing model is designed to maximizes existing resources and does so through an investment system composed of two fluid and close-knit sub-systems. The first being the municipal capitalization system, which is an internal Town application, ideally housed in TownSuite, with budgeting characteristics at its core. The municipal capitalization system is responsible for "specialized finance" stacking, assembling project opportunities and outcomes, sharing the opportunity with its counterpart system, and reporting to specialized financing proponents. The other system, the financial investment vehicle is external to the Town, through an existing or ground-up organization. The financial investment vehicle is responsible for traditional financing, inclusive of community investments, cash disbursements through outcome-data shared by the municipal capitalization system, investing in energy poverty reduction program assets, and reporting to investors.

An important component of the municipal capitalization system, and the Energy Poverty Reduction program as a whole, is utility grade service provision. A Bridgewater energy utility, or municipal-based utility grade services, will decentralize electricity disbursement, streamline the selling and buying of electricity to local stakeholders through self-service, and could mitigate the dependency on local energy markets if based on renewables. Being able to set optimized electricity tariffs would positively impact the rate of return. This program enhancing structure is enabled through legislation and aligns with the global movement of decentralizing a utility as a means to introduce renewables into the grid. This trend has a successful track record of deployment in the USA through the Community Choice Aggregation model and throughout regions of Europe.

The investment system is also supported by a community owned financing vehicle, which not only provides adequate pools of financing, but also provides socio-economic value to the community. A co-operative (co-op) structure provides its members with a democratic voice in the entity's decision-making processes. The co-op will own shares in a Community Economic Development Investment Fund (CEDIF) organization, and the coupling of these two symbiotic entities are responsible for financial investment vehicle operations. This model allows for at-risk participation, at-risk dividend-returns and is the vehicle that secures debt-financing and equity contributions from pools of local and national investors.

Early conversations with potential funding proponents suggest there is a wealth of interest in participating in the energy poverty reduction program due to the returns generated. Investor enthusiasm is further stimulated by the social returns, which align with their organization's mission. These conversations are reinforced by the current trend of impact investing growth which doubled in size between 2017 and 2018. Costs without a return on investment are not feasible expenditures for the Town to incur without 3rd party intervention. Thus, strategic partnering with social-value investors are essential to the program's success. Fortunately, there are a wealth of value-aligned resources at the Town's disposal whose relationships will be leveraged through shared goals and outcomes.

To explain the investment system engine, we'll first provide a high-level Investment System overview, then review its two major constituents: the Municipal Capitalization System and the Financial Investment Vehicle and all their intricacies. With these components defined at a high-level, we'll then examine Investment System activities, which provides an overview of the 4 major investment handling stages: planning, intake, delivery, output.

Due to the depth of funding resources, it is also important to define the hierarchy of senior and subordinated resources as a risk-mitigating exercise. Fundamental considerations are then summarized in the conclusion. With these systems defined, it is possible to design an

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Investment System schedule which highlights itemized activities and outputs throughout the 10-year Energy Poverty Reduction Program. These are broken down by investment sub-system: Municipal Capitalization System and Financial Investment Vehicle.

INVESTMENT SYSTEM OVERVIEW

The Investment System is composed of two sub-systems which act as the engines that fuels the energy poverty reduction project. The primary reason for this separation is directly linked to current legislation and the resulting inability to house all operations under one roof while still achieving the desired outcomes, as accentuated in the following section, Financial Investment Vehicle. There are 4 dynamic stages in the investment system's architecture which fit within the context of a Nova Scotian community, but is replicable nationally using tools and resources available within other provincial jurisdictions. At a high-level, both systems will interact with one-another and the Energy Poverty Reduction projects in a circular fashion.

In summary, both investment systems have a pool of investment resources. As Energy Poverty Reduction projects are defined, the energy poverty reduction portfolios are packaged into investible opportunities through the municipal capitalization system and shared with the *financial investment vehicle*. Both systems pool their resources to fund energy poverty reduction projects, and upon the development of revenue-generating systems, returns and/or reports are disbursed to each system and their pool of investors as outlined in agreements or offering prospectuses.

MUNICIPAL CAPITALIZATION SYSTEM

Municipalities must adhere to Municipal Government Act legislation. As such, the Town itself is limited to borrowing from the Municipal Finance Corporation capped by a debt service coverage ratio, and can only fund projects that it will own 100% of. Thus, off-book financing and diligent partnership agreements drive what is referred to as the "specialized and municipal funding streams". These streams are separated into 4 groups:

1. **Energy Solution Contracts**
   - **a.** Incentives: through organizations like Efficiency Nova Scotia
   - **b.** Savings Backed Agreements: through Energy Service Companies
2. **Social Value**
   - **a.** Senior government: provincial and federal
   - **b.** Charitable: donating organization
3. **Municipal**
   - **a.** Through the municipal-based utility from the Municipal Finance Corporation
4. **User Fees**
   - **a.** Amortizing mechanisms such as Property Assessed Clean Energy (PACE) programs
   - **b.** Upfront deposits

Municipal Capitalization System

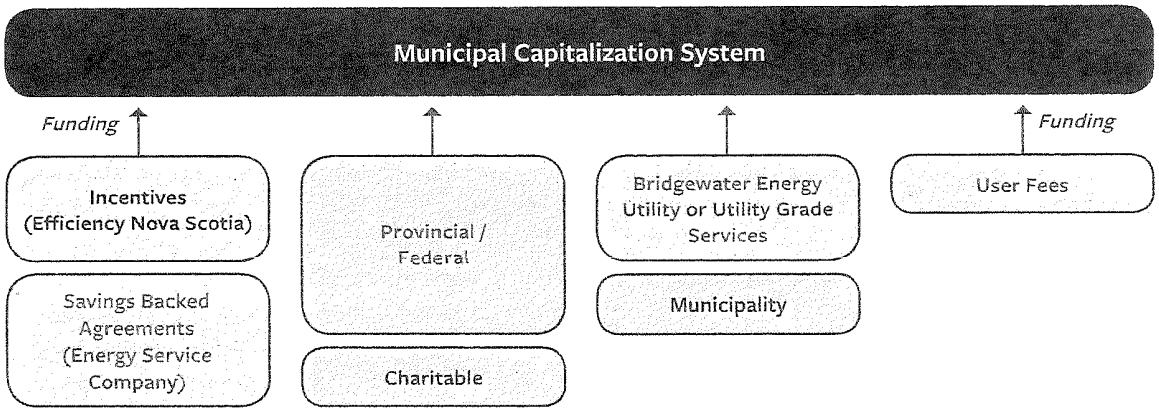

Diagram 9.1

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Energy Solution Contracts

Two key players will provide the Town with specialized funding through energy service contracts: Energy Service Companies and Efficiency Nova Scotia.

Energy Service Companies

Energy Service Company ventures have a proven track record of success. These companies have the capacity to execute on large scale ventures, and the risk is placed on the Energy Service Company rather than the property owner or municipality. Although contract negotiations are complex, Energy Service Companies may bid on the retrofit projects and the Town can secure a contract with the most attractive terms (amortization, interest rates, leverage). Energy Service Companies will be procured through a request for proposal process, and the winning proponent will finance and undertake retrofit developments and are paid back through guaranteed energy savings. As a result of economies of scale, the larger the Energy Service Company project scope the more attractive the terms.

Efficiency Nova Scotia

Efficiency Nova Scotia is a province-based, non-profit, energy efficiency utility which provides its customers with energy solutions through rebates on efficiency-based technologies. Through contractual agreements with Efficiency Nova Scotia, the Town can secure assets and services at a discount.

Social Value Investors

To cover the costs of line items with no return on investment, the Town must secure funding from sources who expect no financial return but are motivated by social outcomes instead Through the Income Tax Act, the Town is granted the authority to issue official receipts that can be used for charitable expenses for income tax purposes. This will appeal to donors contributing funds to the energy poverty reduction program. The Town envisions support from the federal and provincial government and arms-length government organizations such as the Canada Mortgage and Housing Association, whose 10-year, $40-billion national housing strategy plan aligns perfectly with the Town's Energy Poverty Reduction program.

Municipal

In Nova Scotia, municipalities are granted rights to become a wholesale electricity customer under the Electricity Act. This gives the Town of Bridgewater the ability to establish its own municipal-based energy utility, or procure utility grade services, through which it will provide electricity to customers in the town. This could offer significant benefits for Bridgewater, and

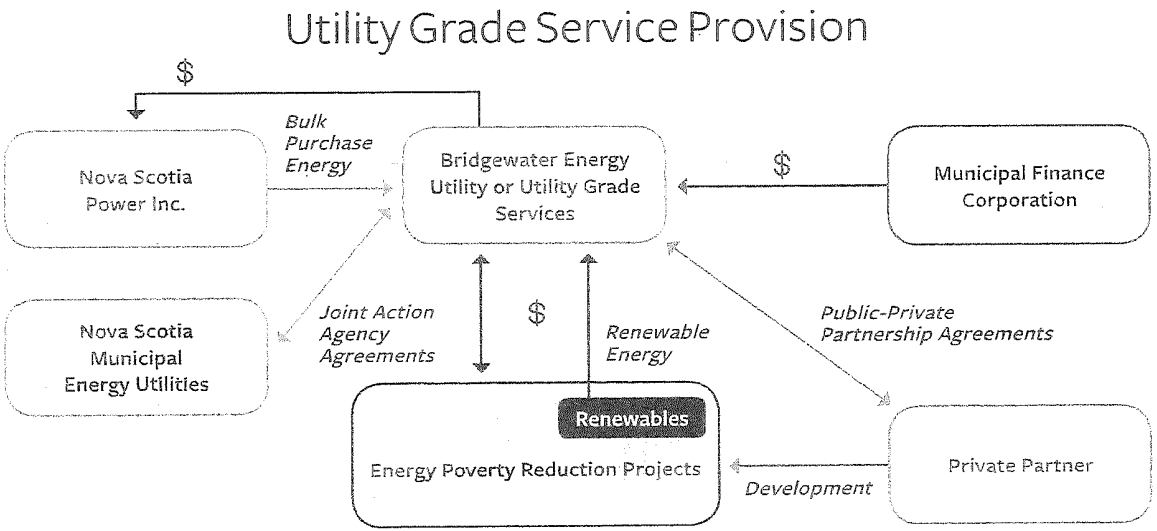

Diagram 9.2

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information
Page 921 of 1849

possibly the surrounding communities seeking to accelerate renewable energy and energy efficiency initiatives. An emerging trend of clustering utilities will also be explored further: the idea of combining utility services to optimize operations through interconnectivity while generating additional sources of revenue and/or decreasing existing utility costs. Diagram 9.2 below provides an overview of key municipal-based energy utility actions, and a summary of the infographic's components follows.

Nova Scotia Power Inc. | Renewables | Bulk Purchase Energy | Renewable Energy

The Town will procure its energy needs from the development of local renewable energy sources within the portfolio of energy poverty reduction projects and through bulk purchases of electricity from Nova Scotia Power Inc. Bulk purchasing will reduce costs to the Town's residents and energy imports will reduce over time through the development of local renewable energy sources.

Public-Private Partnership Agreements | Private Partners | Development | Nova Scotia Municipal Energy Utilities| Joint Action Agency Agreements

Partnering with a private entity through a Public-Private-Partnership agreement / Alternative Financing and Procurement may provide the Town with the capacity to build and operate a public utility or procure utility grade services. The Town can leverage its favorable relationships with other Nova Scotia municipal energy utilities to form a Joint Action Agency. Joint Action Agencies are a tool that municipal distribution utilities can use to accomplish their goals of reliable, safe and low-cost electric supply and services to their communities in an efficient and effective manner. Shared costs and mutual support make the effort manageable and provide an effective interface to the ever-growing complexity of the electric power supply industry.

Municipal Finance Corporation

In Nova Scotia, Municipal energy utilities are regulated by the Nova Scotia Utility and Review Board. Pursuant to the Public Utilities Act, the Utility and Review Board exercises general supervision over all electric utilities operating as public utilities within the Province. This authority includes setting rates, tolls, charges, and regulations for the provision of service and approval of capital expenditures in excess of $250,000. Debt incurred by a municipal utility through the Municipal Finance Corporation, must be guaranteed by the municipality and is reviewed by the province on a case-by-case basis. A business case, third party consultant reports to validate risks and assumptions, as well as required reserve funds are reviewed for borrowing consideration.

User Fees

Property Assessed Clean Energy (PACE) financing programs allows homeowners to finance energy efficiency, renewable energy and other eligible improvements on their buildings using private sources of capital. PACE programs are enabled through legislation and authorized at the local government level. Municipalities may directly administer residential PACE programs, or via public-private partnerships with one or more PACE administrators.

Two PACE programs are operating in Bridgewater: (1) Clean Energy Financing, financed through a municipal Local Improvement Charge via a Municipal Finance Corporation loan and secured through a property lien. (2) The Clean Net Zero pilot project is administered by Clean Foundation and financed in part through the Municipal Finance Corporation and in part through the LaHave River Credit Union. Both promise a 1:1 savings-to-debt ratio, to ensure that the homeowner remains cashflow neutral or positive.

It is envisioned that property owners enrolled in the energy poverty reduction program will incur some of the retrofitting costs. Whether this is through the aforementioned amortizing PACE structure, or simply an up-front contribution is still to be determined.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Financial Investment Vehicle

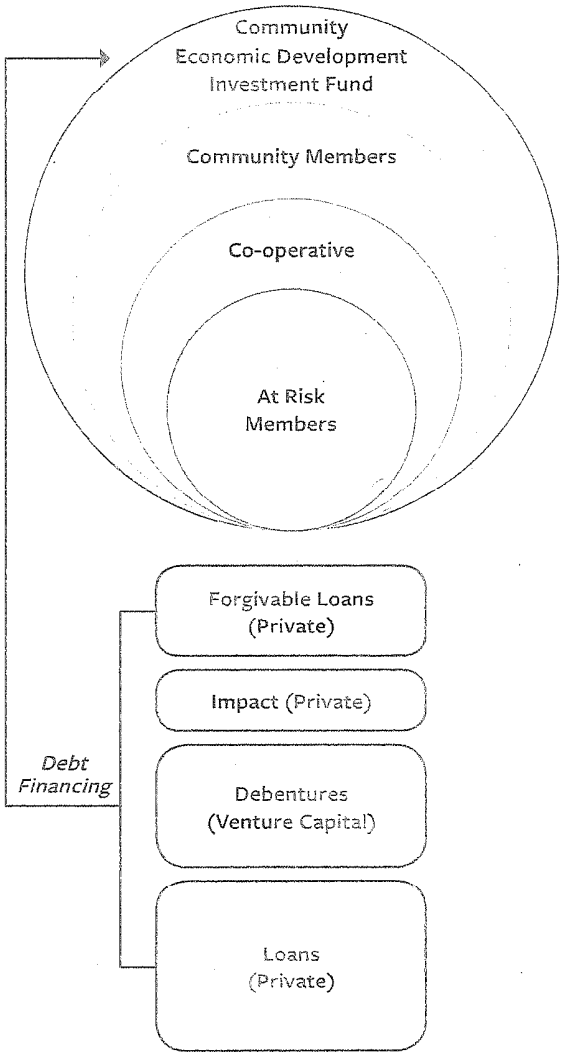

Diagram 9.3

Conclusion

The Municipality will act as the administrator of the 4 steams of funding and the collective activities and responsibilities create the foundation of the municipal capitalization system.

FINANCIAL INVESTMENT VEHICLE

An engine external to the municipality, not restricted to the Municipal Government Act, is required to exploit traditional and community forms of financing. To maximize the benefits of this structure, the Town will include a community-favouring organizational governance structure to allow for at-risk participation and community investments. The three major components to the traditional and community Financial Investment Vehicle are:

1. Community Economic Development Investment Fund (CEDIF)
2. Co-operative (Co-op)
3. Traditional Financing Sources

Community Economic Development Investment Fund (CEDIF)

CEDIFs are pools of capital which is raised from individuals through the sale of shares by for-profit entities to invest in projects. CEDIFs provide a mechanism for accessing local capital so that residents can directly invest in their communities. CEDIFs have had a history of success, a strong legal and regulatory framework paired with considerable support from the Province of Nova Scotia. This community-centric entity will allow for community members to participate in local infrastructure investments. This entity is the cornerstone mechanisms that will secure traditional forms of financing (debt), community financing (equity) and is structured to be the parent company of a co-operative.

Co-operative (Co-op)

A Co-op, such as an owner's co-op, will own a determined number of shares within the CEDIF entity. At-risk community members will be provided with co-op memberships and shares in the co-op. This set-up allows for this often-forgotten sub-section of the community to be given a voice through the democratic nature of a co-op. If carefully structured, the at-risk demographic will also receive dividend disbursements as a result of share-ownership through energy savings incurred through the energy poverty reduction program. That is, whatever is remaining after other financing proponents are paid their pre-determined dividends and interest/principal contractual obligations.

Traditional Financing Sources

The CEDIF will secure debt through traditional funding sources including, but not limited to, forgivable loans, impact investors, venture capital debentures, and traditional loans such as long-term-debt financing.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Conclusion

The CEDIF will act similar to that of a special purpose vehicle, although it will not be considered a municipal arm's length entity. Securing traditional financing while allowing for community investments and at-risk participation create the foundation of financial investment vehicle.

INVESTMENT SYSTEM ACTIVITIES

Diagram 9.4 displays the dynamic activities of the Investment System, providing an overview of the 4 major investment handling stages: planning, intake, delivery, and output as summarized below.

Planning

- **ID projects:** The Town's Energy Management Information System identifies investible community energy system and houses energy management system portfolios.
- **Data Sharing - Energy Management Information System, Municipal Capitalization System:** The Energy Management Information System shares portfolio data with the Municipal Capitalization System, which refines this information to source capitalization streams.
- **Agreements Procured:** The Municipal Capitalization System determines the best-value coupling of specialized and municipal funding streams and approaches these proponents to secure agreements, both long and short term.
- **Data Sharing - Municipal Capitalization System, Financial Investment Vehicle:** The Municipal Capitalization System shares project financing requirements with the Financial Investment Vehicle.
- **Institutional Prospectus:** The Financial Investment Vehicle generates institutional prospectuses and signs contracts with traditional investors whom provide the best value for the Town.
- **Community Prospectus:** The Financial Investment Vehicle generates a CEDIF prospectus with terms that aligns with the Town's needs yet is attractive to community investors.
- **As Risk Shares:** Co-op and membership shares are issued to at-risk community members participating in the Energy Poverty Reduction program.

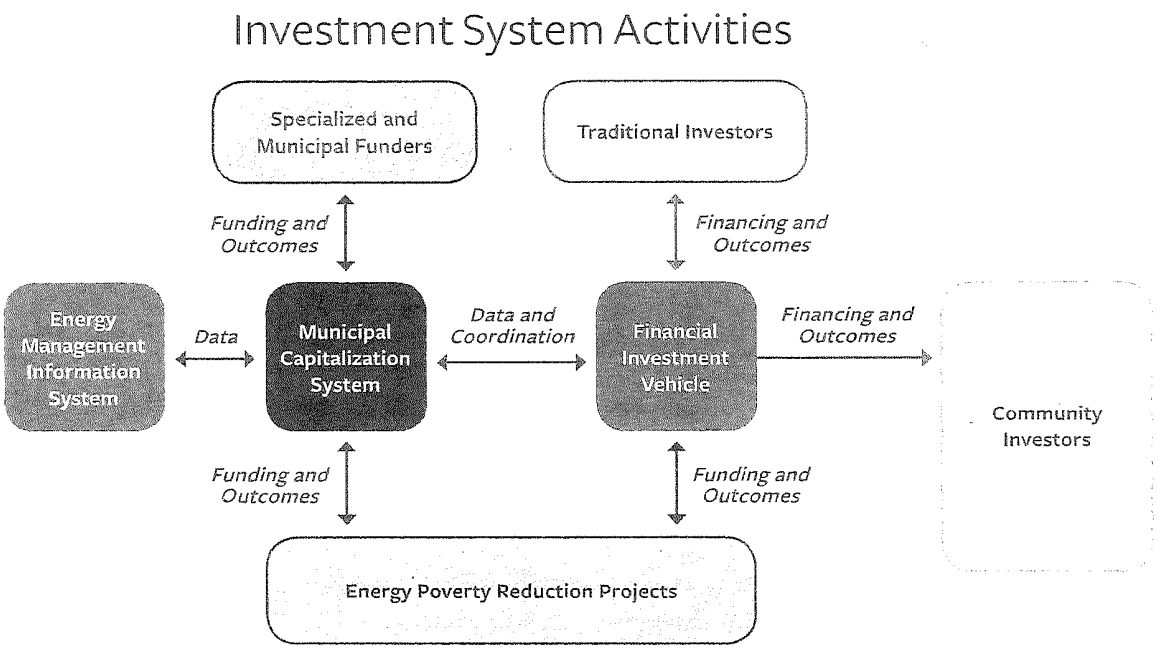

Diagram 9.4

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

$ FINANCIAL

Intake

- **Funding and Contributions:** The Municipal Capitalization System receives funding and resource contributions from specialized and municipal funders.
- **Institutional Investments:** Institutional investments flow to the Financial Investment Vehicle from a variety of traditional investor sources with specified terms attached.
- **Community Investments:** CEDIF investments flow from the community investors to the Financial Investment Vehicle.
- **Data Sharing - Financial Investment Vehicle, Municipal Capitalization System:** The Financial Investment Vehicle and the municipal capitalization system share funding contributions with one another.
- **Data Sharing - Municipal Capitalization System, Energy Management Information System:** The Municipal Capitalization System shares cumulated funding information with the Energy Management Information System to match funding to initial requirements.

Delivery

- **Data Sharing - Energy Management Information System, Municipal Capitalization System:** The Energy Management Information System and the Municipal Capitalization System confirm capitalization costs match procured funding.
- **Data Sharing - Municipal Capitalization System, Financial Investment Vehicle:** The Municipal Capitalization System confirms funding distribution requirements with the financial investment vehicle.
- **Funding:** Both the Municipal Capitalization System and the Financial Investment Vehicle contribute their pre-determined funding amounts to the Energy Poverty Reduction systems, whereby there is no return on investment on management systems, a marginal return on investment on mobility systems, and a significant return on investment on community energy and housing energy management systems.
- **Data Sharing Energy Poverty Reduction Systems, Energy Management Information System:** Energy Poverty Reduction program outcomes flow to the Energy Management Investment System, which tracks performance results.

Outputs

- **Data Sharing - Energy Management Investment System, Municipal Capitalization System:** Energy Management Investment System performance and outcome data is shared from the Energy Management Information System to the Municipal Capitalization System.
- **Reporting, Energy Savings and Profit:** The Municipal Capitalization System reports outcomes to funders on a pre-determined schedule as outlined in contractual agreements. Energy saving are reconciled with applicable proponents such as Energy Service Companies.
- **Data Sharing - Municipal Capitalization System, Financial Investment Vehicle:** The Energy Poverty Reduction system performance and outcome data is shared from the Municipal Capitalization System to the Financial Investment Vehicle.
- **Reporting and Institutional Disbursements:** The financial investment vehicle disburses interest and principal payments accompanied by any outcome reporting requirements defined in the executed contracts.
- **Reporting and Community Dividends:** The Financial Investment Vehicle issues dividends and tax statements to CEDIF investors. Any additional revenue is passed through the CEDIF to the at-risk co-op members and shareholders.

HIERARCHY OF SENIOR AND SUBORDINATED RESOURCES

In the event that any component of the Energy Poverty Reduction Program defaults, it is important to determine the seniority of capital. Although it is too early in the investment design phase to define orders of subordinated debt, some generalizations can be made. For example,

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

charitable and senior government bodies would have no expectations if the projects are to default, while debentures such as venture capital would expect default disbursements prior to forgivable private loans. These details will be outlined in all funding agreements and are to be presented in an identical manner from one parties' prospectus to another.

INVESTMENT SYSTEM CONCLUSION

The Investment System relies heavily on accurate data flows, meticulous contract negotiations, and timely cash disbursements. If diligently integrated with connected technologies, there would be fluidity with dataflows that would enable this cyclical engine to allow for sustainable project development. Although certain components, such as CEDIFs, are region specific, it is possible to substitute this tool with one found in similar jurisdictions. For example, community bonds could provide the community financing component of this model in Ontario. Finally, in detailing the system's characteristics, one must consider the best accounting practices for each component and ensure all nodes are able to share data compatibly, and without delay, from one party to another.

USE OF FINALIST GRANT

Our community greatly appreciates having been awarded $250,000 through the Smart Cities Challenge Finalist Grant. The grant has allowed us to achieve program design innovations that would otherwise simply not have been possible. The proposed use of the finalist grant, from our original application, is described in Table 9.14.

The Town intended to leverage $250,000 of grant funding with $54,000 in in-kind support (through staffing) to achieve a total project value of $304,000. Following the completion of the Final Application, the revised use of finalist grant can be viewed in Table 9.15.

Variances between the budgeted use of the Smart Cities Challenge Finalist Grant and projected actual costs are explained as follows:

- **Priority 1:** underspent by $17,054 as capacity building costs were shifted from contract work to in-kind work (staffing). Reflected in increased in-kind contribution for this priority area.
- **Priority 2:** overspent by $20,031 due to a greater level of community engagement activity than originally envisioned, including the production of youth-at-risk documentary on the subject of energy poverty, and a robust communications strategy.
- **Priority 3:** overspent by $26,522 due to a greater need for technology, data flow, and privacy impact assessment than originally anticipated. In-kind costs (staffing) were captured under priority 1.
- **Priority 4:** underspent by $30,410 due to a lower need for professional resources (legal counsel, consultants) for project partner engagement. Budget set aside for partnership contract development was unused. In-kind costs (staffing) were captured under priority 1.
- **Priority 5:** overspent by $911 due to higher than anticipated professional costs in developing the Final Application. In-kind costs (staffing) were captured under priority 1.

Proposed Use of Finalist Grant for Initial Application

Priority Area Capitalization Source	Smart Cities Finalist Grant	Town of Bridgewater In-Kind	Total Value
Priority 1: increase capacity & knowledge	$50,000	$20,000	$70,000
Priority 2: engage community	$45,000	$7,000	$52,000
Priority 3: refine approach to technology & data	$65,000	$5,000	$70,000
Priority 4: refine service delivery approach	$85,000	$20,000	$105,000
Priority 5: create final proposal	$5,000	$2,000	$7,000
Total	$250,000	$54,000	$304,000

ENERGY POVERTY REDUCTION PROGRAM

Final Application to the Smart Cities Challenge $5M Prize Category

Processed under the provisions of the Access to Information Act / Traité en vertu de la Loi sur l'accès à l'information

MESSAGE FROM THE MAYOR

Mayor David Mitchell

Our community will lift its residents out of energy poverty, starting by reducing the energy poverty rate by 20% by 2025.

As Mayor of the Town of Bridgewater, that is a challenge statement that makes me proud to serve my community. The fact is, Bridgewater is ready for a massive shift toward a smart energy economy by becoming a Smart Community. Through our Energize Bridgewater program, our community has demonstrated nationally-recognized leadership in understanding and planning a pathway toward a new kind of energy economy – one where energy services are universally available and affordable, clean and efficient, and protected from supply volatility and the coming ravages of climate change.

Through our proposed solutions, we will make sure that those among us who are most vulnerable, and least able to afford the transition, are the first ones we help across the threshold. Those residents have the most to lose, and through the betterment of their lives, our community has everything to gain.

The stories shared by our community partners and residents have made it clear that energy poverty is having a profound and debilitating impact here in Bridgewater. It systematically strips as many as 40% of our residents of their dignity and damages the physical and mental wellbeing of young and old alike.

Yet, the real, lasting, and practical solutions to this problem are so close at hand that we can already see them emerging. Through this Challenge, our town will design and prototype a new model of municipally-led accessible and affordable energy management services for our community's most vulnerable residents. Dramatic improvements to housing, transportation, and community services will be driven by a self-financing investment program and a coordinated access system, all powered by connected technologies.

We've been innovative. We've been bold. We've made change happen. However, nothing we've done to date has come close to achieving the impact of our proposed Energy Poverty Reduction Program. At the same time, everything we've done to date has prepared us to make this leap.

We need help in launching this bold idea. By selecting Bridgewater as the winner in the $5 million Smart Cities Challenge prize category, Canada will support a powerful new demonstration of technology-enabled community-based problem solving that addresses both the poverty crisis and the climate crisis at the same time. Bridgewater is ready to show Atlantic Canada, and the nation, how it can be done.

David Mitchell

APPENDIX 107

EXECUTIVE SUMMARY

Our community will lift its residents out of energy poverty, starting by reducing the energy poverty rate by 20% by 2025.

Bridgewater's growing need for clean and reliable energy is limited by our ability to afford it. Our estimates show that the burden of energy poverty is carried by 38% of Bridgewater households that are unable to meet their basic energy and transportation needs. Many more are at risk of falling into this category as it's expected that energy prices will continue to trend upwards. Bridgewater is approaching this issue through systematic change at a household, neighbourhood, community, and regional level by, treating access to affordable and secure energy as a requirement for healthy living. To ensure residents can live free of the constant threat of energy poverty, our program uses energy management as a smart city approach for resident empowerment.

Bridgewater envisions an Energy Poverty Reduction Program that uses data and connected technology to bring together and drive energy savings to create financial returns for households and property owners. This system also provides coordinated access to community supports for households experiencing energy poverty. And finally, a financial system that supports extensive investment in energy efficiency solutions. Bridgewater's impactful, comprehensive approach to community-based problem solving and transformational change is highly transferrable to communities across the country that are struggling with energy poverty challenges of their own. Municipalities are uniquely positioned to be at the forefront the of shifting world of energy systems, pairing data and connected technologies for community services that ensure underserved populations are the first beneficiaries of the energy transition.

1. **Vision:** why this matters, and overview of services
2. **Performance Measurement:** detailed program descriptions, deliverables, and outcomes
3. **Governance:** accountability structure, and program partners
4. **Project Management:** team members and risk management
5. **Technology:** data platforms, connected technologies, and energy solutions
6. **Data and Privacy:** how information will be used, safeguarded, and shared
7. **Engagement:** community consultations up to now, and going forward
8. **Implementation Phase Requirements:** fulfilling national expectations
9. **Financial:** costs, revenues, innovative financing solutions, and how we used the Finalist Grant

Appendix: letters of support

TOWARD A FUTURE FREE OF ENERGY POVERTY

Bridgewater, like most communities across Canada, has a growing hunger for energy. Our energy needs are everywhere – cellular phones, warm showers, food refrigeration, heat during the frigid winters, lights, laundry, and computers. With our energy needs increasing, many households in Bridgewater are unable to afford the rising costs of this service and are having to make impossible decisions to balance monthly household budgets.

As a 'have not' province, Nova Scotia has struggled for decades with the issue of widespread poverty and low incomes. Given our region's and our community's overall economic challenges, energy insecurity adds a real and growing threat to our ability to meet our basic needs. When we asked our community partners to tell us how urgent energy poverty issues are in relation to other issues in Bridgewater, Family Service of Western Nova Scotia stated: "this may be the least talked about yet most significant and productive structural, community, and individual issue we could tackle." The challenge of energy poverty is daunting and overwhelming, yet the Town of Bridgewater is firmly convinced that it is possible to create a solution to both the poverty crisis and the climate crisis by using technology-enabled community-based problem solving.

Energy poverty isn't just lingo for Bridgewater – it is a real problem for real people. Our program team has spent considerable effort in defining this term to be meaningful to our residents, especially those who identify with its hardships. In our initial application, we **defined energy poverty using the indicator of a household spending 10% or more of its after-tax income on energy, with fuels and electricity for the home as well as transportation counting toward energy expenditures.** We maintain that this definition is accurate, but understand that energy poverty can also be so much more.

Bridgewater and its community further defines **energy poverty based on access to affordable and secure energy in their home, neighbourhood, community, and region. The greater the degree of insecurity or lack of access, the greater the risk that the household will experience energy poverty**[1] This shift in perspective lifts the burden of energy poverty mitigation from being focused solely on the individual household, toward including community and regional infrastructure and services.

With this new emphasis on risk for energy poverty, research was required to determine what exactly the risk factors are and how this affects Bridgewater's vulnerability. Table 1.1 describes the energy poverty risk factors identified by our community.

Systematic Levels of Energy Poverty Risk

Risk Level	Description
1. Household	Household-level risk factors include personal risk influences such as the energy efficiency of the home and transportation means as well as general poverty risk factors such as income, health, literacy, family supports, etc.
2. Neighbourhood	Neighbourhood-level risk factors include neighbourhood energy systems, walkable streets, transit service, etc., as well as the energy efficiency of multi-unit residential buildings (MURBs).
3. Community	Community-level risk factors include community-scale energy and transportation systems, the energy efficiency of the overall housing stock, community support services, social stigma, and whether the community has developed a coordinated response to the problem of energy poverty.
4. Broader Systems	Broader systems-level risk factors include the price of energy in the region; the availability of secure, affordable energy technologies; employment opportunities; economic diversity, etc. It also includes provincial and federal programs and policies that may remedy or exacerbate energy poverty.

Table 1.1

[1] This model of energy poverty aligns well with the Social Determinants of Health and other health risk and inequality models used by modern public health initiatives including Health Canada.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

VISION

As Bridgewater gained a greater understanding of energy poverty during the final application phase, the breadth of its impact on our community became startlingly clear. Early research indicated that as much as 40% of Bridgewater's population may be experiencing energy poverty in some form. A community census was undertaken to validate residents' lived experience with energy poverty. From that census, we can confirm that 38% of residents currently experience, or are highly at risk of, energy poverty. Add to that the recent Statistics Canada report that the number of Nova Scotian children in poverty has risen from 14% in 2016 to 17% in 2017[2] and it is very clear that the problem of poverty in our community is not going away and requires urgent and responsive action.

Bridgewater is a community driven to overcome our challenges through deep engagement and innovative projects. To demonstrate our sincerity in creating real and meaningful change, Bridgewater commits itself to the following Challenge Statement:

Our community will lift its residents out of energy poverty, starting by reducing the energy poverty rate by 20% by 2025.

Targeted Energy Poverty Reduction Rate by Program Year

Year	2020-21	2021-22	2022-23	2023-24	2024-25	2029-30 After 5 more years
Population *(projected)*	9,031	9,156	9,211	9,266	9,320	9,583
Households Experiencing Energy Poverty *(projected, based on current 38.5% energy poverty rate)*	1,659	1,682	1,692	1,702	1,712	1,760
Number of Households Helped *(Cumulative)*	0	50	125	225	350	1,100
Energy Poverty Rate Reduction *(Cumulative)*	0%	3%	7%	13%	20%	62%

Table 1.2

With a five-year implementation horizon for the Smart Cities Challenge, the community has designed a program that will reduce the energy poverty rate in Bridgewater by 20% by 2025, while maintaining the long-term goal from the original challenge statement to lift 20% of its residents out of energy poverty within 10 years. With a $5 million grant from Smart Cities Challenge, the Town is confident that change can be realized within a single generation. And with a revised start date of 2020, the Town is eager to begin this very important work.

Based on the current and projected future population of the community, our Challenge would mean lifting 350 households out of energy poverty by fiscal year 2024-25. The community would then be on track to cut its overall energy poverty rate in half by 2028, and by as much as 62% over a 10-year timeframe (by fiscal year 2029-30). Our anticipated progress is illustrated in Table 1.2.

The Town of Bridgewater envisions a future for our community where energy poverty reduction strategies work in tandem with clean and efficient energy systems to confront energy poverty at its core – the very source of the energy itself. With assistance from the Smart Cities Challenge, we will overcome existing barriers to achieve our community vision:

By 2050, Bridgewater's green, self-supportive economy will be securely powered by clean and efficient energy systems. The community's conscious investments into energy infrastructure, equipment, training, and education will make energy affordable and accessible for all members of the community, and contribute to our town's prosperity and resilience in the face of a changing climate and world.

- Bridgewater's Energy Shift vision, Community Energy Investment Plan (2018)

Our commitment to this project will empower our community to take a leadership role in combating energy poverty, which is a daily threat to our sustained health and economic viability. The energy poverty solution is our most ambitious vision to date and we can't wait to show the rest of Canada that even small towns like Bridgewater can lead a change of this magnitude.

ENERGY MANAGEMENT AS A SMART CITY APPROACH

Households experiencing energy poverty know first-hand the critical importance of managing their energy consumption and therefore their expenses. The stories we have collected from the community have been truly stunning in this regard: we have documented families turning off their heat for days at a time in the middle of winter to be able to afford their next power bill, or going without light and powered devices at the expense of their health and wellbeing. From an energy management perspective, this has informed us that Bridgewater residents who experience energy poverty often already have well-practiced skills in energy management. What they tend to lack is energy efficient home heating systems and other infrastructure to work with, and adequate control over their home and transportation options.

I reduced my power bill from $120 to $60 by unplugging everything when I am not using it. I don't really use lights, only when company is over. I use my phone as a flashlight. – RESIDENT, TOWN OF BRIDGEWATER

Bridgewater's Energy Poverty Reduction Program is well matched to a smart cities approach, as it aims to restore control to our residents over their energy costs and infrastructure by leveraging the fundamental benefits that data and connected technology have to offer. Throughout this application we will reinforce how a small town can be a smart city by showcasing:

- how data can be used to create open and strong communities inclusive of the most vulnerable members and how access barriers to this data can be overcome (**See Data and Privacy chapter**);
- how data and connected technology can be a uniting force to bring together the municipality, other levels of government, government organizations, and private enterprise (See **Technology chapter**);
- how the innovation of one community can be transferable to our neighbours across the nation (see **Performance Measurement** and **Project Management chapters**);
- how connected technology enables collaboration between service providers and industry for the betterment of society (See **Governance chapter** and **Data and Privacy chapter**).

Through the program, the Town of Bridgewater will provide advanced new **energy management support services** to 2 primary clients:

1. Bridgewater households who are highly at risk of energy poverty, currently estimated at 38% of Bridgewater's population.
2. Bridgewater property owners whose properties are inhabited by households-at-risk of energy poverty. Housing energy efficiency is a key risk factor in determining whether or not a household will experience energy poverty. Groups of property owners can be clustered together to receive neighbourhood-scale energy services and solutions.

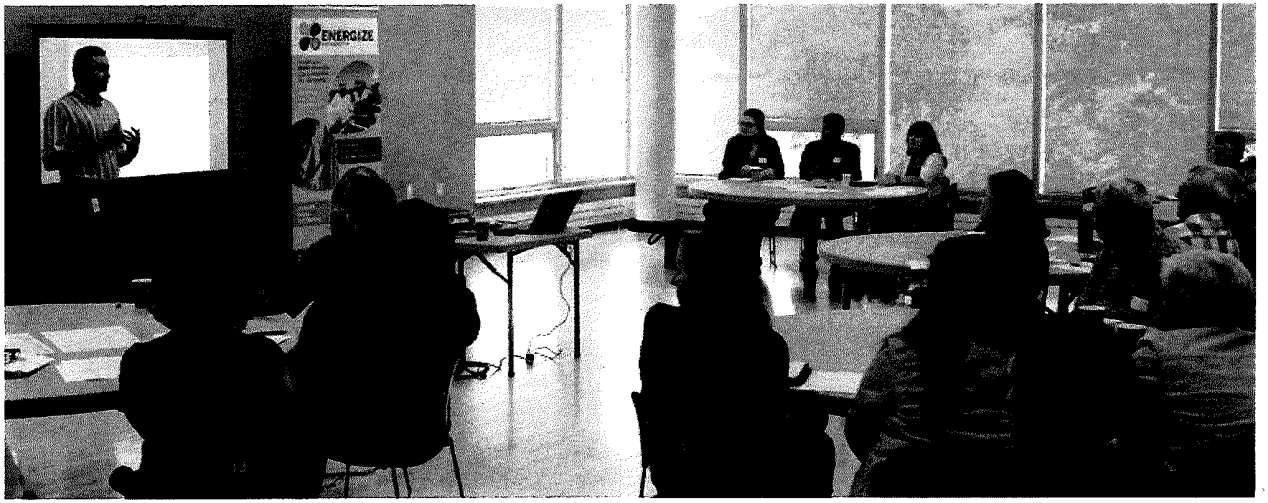
In situations where the households-at-risk own the homes they live in, the two clients are one and the

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

>>>

same. For a large number of households-at-risk, however, home ownership is not affordable, and rental housing is their only option. In this case, the property owner is the household's landlord. In Bridgewater, 43% of residents rent their home (Statistics Canada, 2016). We anticipate that the majority of property owners in the programwill be landlords.

As we explain in the rest of this application, the Energy Poverty Reduction Program builds on existing municipal service competencies, data systems, and infrastructure. As such, this service concept is widely replicable and transferrable to other communities where municipalities already play a critical role in community service provision.



For those experiencing energy poverty, access to the technology and data to manage their energy needs is often very limited. For the most vulnerable, interfacing with a human rather than a dashboard is the most practical way to assist with assessing their needs and solving the immediate problems caused by energy poverty. Not having or being at risk of losing their shelter, these residents will need access to a range of community, health, employment, and other services, not just services that relate to housing and transportation.

The program will establish navigators for the different system components of the Energy Poverty Reduction Program. These navigators will be human interfaces for households-at-risk, connecting them with the services they need, including the energy management services offered by the Town of Bridgewater. Coordinated Access Systems are widely replicable and transferrable to other communities. Additional information is provided in the following chapters.

INNOVATION AT THE CORE

The design of the Energy Poverty Reduction Program combines 3 innovative mechanisms to reduce risk of energy poverty:

1. Connected technologies: forming the backbone of the service concept, connected technologies provide a technological 'engine' that drives energy savings to create financial returns for the households and property owners, and streamlines client intake and access to community services.
2. Coordinated access: a social support 'engine' that keeps clients connected to the program and coordinates access to the various additional community supports households-at-risk may need.
3. Financial investment: building on Bridgewater's experience developing a fully-costed approach to energy transition, self-financing energy improvements provide a financial 'engine' that supports extensive investment in energy efficiency solutions.

Community Working Group members view a presentation at a Smart Cities Challenge workshop.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

Core Design Innovations

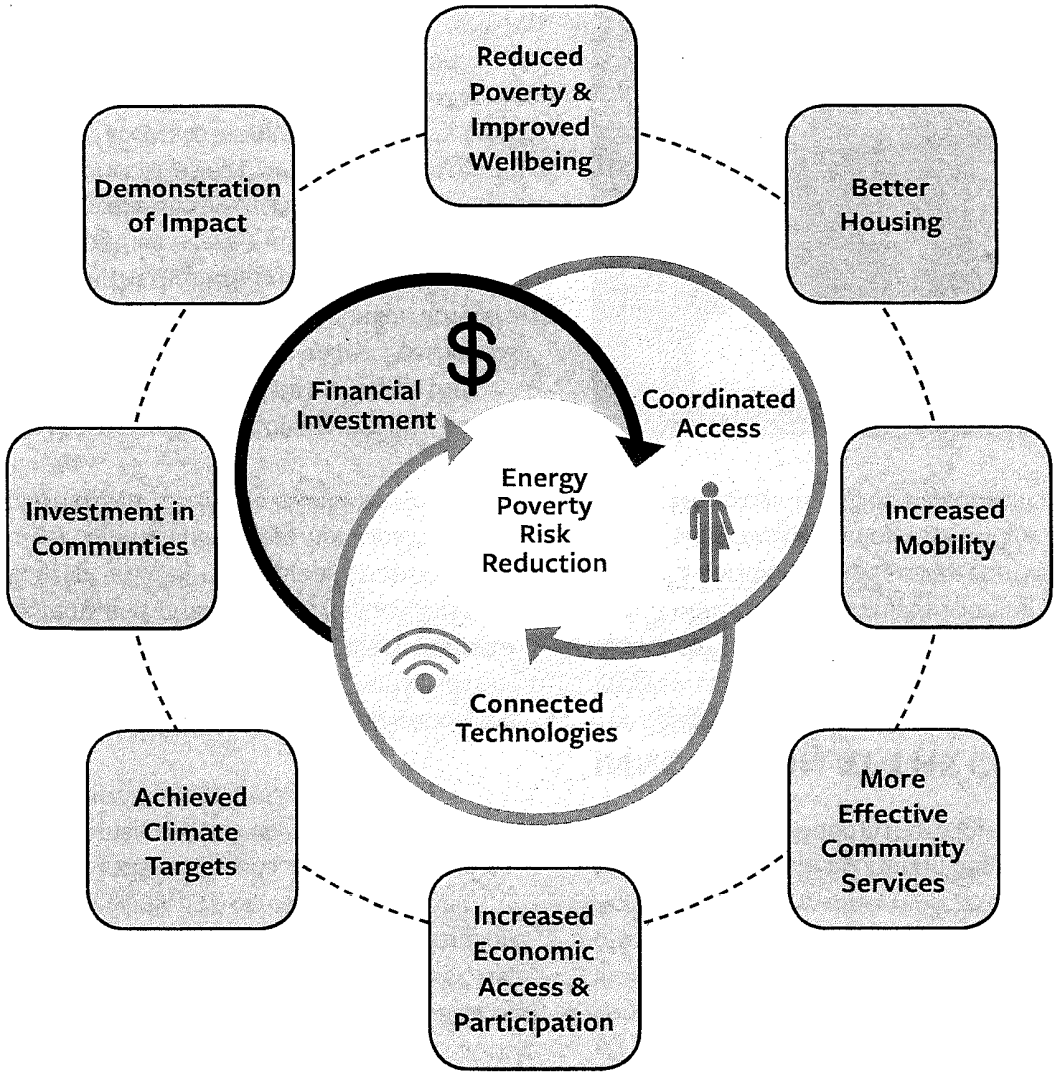


Diagram 1.1

These 3 innovations mutually enable and strengthen each other's outcomes. This synergy drives systematic and continuous improvements to housing, transportation, and community services, thereby reducing energy poverty risk and improving many dimensions of community life. These innovations and their anticipated outcomes are captured visually in Diagram 1.1.

A GREATER COMMUNITY IMPACT

Starting with our initial application, we have embarked on a deep and meaningful discussion with our community. From households-at-risk, to community service organizations, to landlords and energy utilities, the Town has listened to lived experiences in our community and developed a program that will positively impact a multitude of community needs. Consequently, our program outcomes have grown substantially. Table 1.3 summarizes the anticipated outcomes by category, and indicates their relationship to our initial application:

The expanded outcomes demonstrate a greater understanding and articulation of our Challenge to lift our residents out of energy poverty. Cumulatively, they reflect the community's urgent call for transformative change at all levels to achieve this goal. The outcomes are transferrable to other communities with very different local and regional contexts compared

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accés à l'information

Anticipated Outcomes by Category

Outcome Category	Outcomes	Relation to Initial Application (April 2018)
Reduced Poverty & Improved Wellbeing	1. Reduce energy poverty rate	Challenge statement
	2. Reduce poverty	New
	3. Improve health of residents	Outcome 6
	4. Increase residents' quality of life	New
	5. Increase residents' sense of empowerment and inclusion	New
Better Housing	6. Increase energy security for residents	New
	7. Reduce and stabilize energy expenses for residents	Outcome 4
	8. Improve relationship between tenants and landlords	New
	9. Improve residential energy management practices	New
Increased Mobility	10. Improve residents' mobility	Outcome 3
More Effective Community Services	11. Improve residents' access to community services	New
	12. Improve community service delivery efficiency and effectiveness	Outcome 7
	13. Shift community service spending toward systemic solutions	Outcome 8
Increased Economic Access & Participation	14. Increase residents' income	Outcome 8
	15. Increase residents' participation in the green economy	Outcome 8
Achieved Climate Targets	16. Reduce greenhouse gas emissions	New
	17. Shift to efficient, clean, affordable, and secure energy	New
Investment in Communities	18. De-risk affordable energy investments in the community	New
	19. Successfully fund energy poverty reduction solution	New
Demonstration of Impact	20. Demonstrate feasibility and effectiveness of program	New
	21. Inspire structural energy poverty solutions at the Provincial and Federal levels	New
	22. Inspire other communities to adopt energy poverty reduction efforts	New

NOTE: No outcomes have been lost between the initial and final applications. Outcome indicators and targets are described in detail in the **Performance Measurement chapter.**

Table 1.3

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

to Bridgewater. While other communities may need to make modifications to the specific indicators used to measure progress based on locally available information, the outcomes are universally meaningful, measurable, monitorable and well-suited to a smart cities approach.

APPLICATION REFINEMENTS TO BETTER ACHIEVE OUTCOMES

In order to lift our residents out of energy poverty, the design of the Energy Poverty Reduction Program has undergone significant improvement and refinement. Whereas it was originally proposed as a set of 7 interlocking sub-programs, the updated program design has been simplified into a set of 5 connected services, designed with universal transferability and application to other communities in mind.

Program services are explained in the sections that follow:

This service provides a single coordinated intake process for program participants, with a special focus on households-at-risk who may be in need of acute and emergency services, underserved subpopulations, as well as those who can benefit from preventative services. A common assessment tool (VI-SPDAT[3] or similar) aids the intake and referral process, and encourages

>>>

ATIA - 21(1)(b)

uniformity within and between communities. Using a trauma-informed service provision lens and specialized training, multiple system access points and outreach services refer new and existing clients to any community services they may require, including: protective; health; social; housing and emergency shelter; transportation; financial; employment; education and training; accessibility; and other related community and government services. Among these services are the services provided by the Energy Poverty Reduction Program.

Energy Poverty Reduction Program Architecture

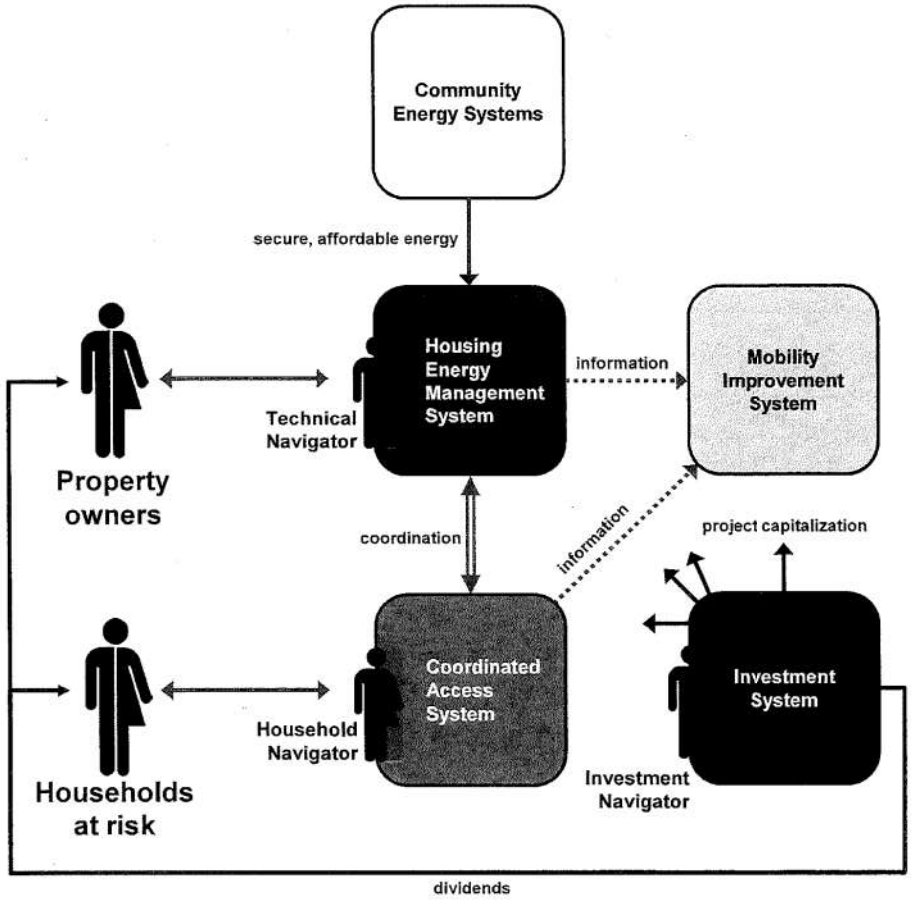

Diagram 1.2

The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement chapter: Partnership Coordination, and Coordinated Access Service Provision.**

Communities that already have a Coordinated Access System in place can leverage those existing services.

Relationship to Data & Connected Technologies: we propose that this service make use of the nationally-accessible Homeless Individuals and Families Information System (HIFIS), hosted by Employment and Social Development Canada (ESDC), as its core data platform. This will facilitate data exchange with community service providers as well as the municipal data platform that will house the rest of the Energy Poverty Reduction Program. The use of this national database would also facilitate inter-community collaborations and performance metric comparisons.

[3] Developed by Org Code Consulting, this assessment tool is widely used in Canada for planning and prioritizing service provision to underserved populations particularly for housing and shelter needs. The tool is already in use in Bridgewater.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)

Housing Energy Management System

This service provides property owners with turn-key energy monitoring, planning, management, retrofit, and financing services. Services address retrofits to existing housing stock, as well as services and incentives to support the construction of highly efficient new housing units. The target of the program is to achieve a universal energy performance improvement of the community's housing stock of approximately 60%, and to further supplement that with an additional 30% in renewable energy generation, for a total imported energy cost reduction of 90%. Individual energy performance targets will be set for participating properties as part of the client intake process, and will be updated periodically as new energy management solutions become available.

The service consists of 3 sub-programs that are explained in detail in the Performance Measurement chapter: **Program Coordination & Administration, and Housing Retrofits and New Construction.**

The service is designed to leverage existing municipal competencies in asset management and service provision. It also enables communities to leverage and stack existing and emerging energy efficiency programs, whether those have been implemented on the municipal, provincial, or federal levels. In Bridgewater's case, the programming offered through this service will build heavily on, and significantly expand, Efficiency Nova Scotia's energy efficiency services and financial incentives aimed at improving the province's housing stock.

Relationship to Data & Connected Technologies: existing municipal property and financial management software will be used as the core data platform for this program, with the addition of an Energy Management Information System (EMIS) module, and an expansion into Real Time Operations (RTO) functionality. The EMIS interfaces with a network of connected technology points to provide the core energy management functions of energy monitoring, forecasting, and control. The system's functionality is expanded gradually over time as new energy management solutions and community energy systems come online. In Bridgewater's case, the proposed data platform is TownSuite, the Town's current municipal management software.

Community Energy Systems

Supplementing energy improvements in individual homes, this service plans and develops neighbourhood and community-scale energy systems such as solar farms, district heating systems, and microgrids. These systems feed secure and affordable energy to participating properties, and earn dividends for their investors. The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement chapter: Utility Grade Service Provision, and Neighbourhood & Community Scale Energy Systems.**

Communities with their own energy utilities can leverage those existing services to deliver these functions. As community-scale energy solutions will differ based on local and regional context, specific applications need to be tailored to the needs of individual communities. In Bridgewater's case, the community is in the process of exploring the development of its own energy utility, as well as the potential procurement of utility-grade services from an existing utility in the area. Feasibility studies for the selection and implementation of community-scale energy systems are included in the first few years of the program, with a 6MW "solar garden" as the preliminary choice for community-scale energy technology in this proposal.

Relationship to Data & Connected Technologies: community-scale energy systems are powered and controlled by connected digital systems, allowing for a new generation of advanced net-metering, microgrid, and local energy market applications. These functions can effectively integrate into the

Processed under the provisions of the Access to Information Act (Révisé en vertu de la Loi sur l'accès à l'information

municipal property and financial management software described above.

This service receives information from the Coordinated Access System and the Housing Energy Management System to plan and implement mobility improvements based on community needs. As municipalities are typically responsible for neighbourhood and community-scale transportation systems, this service will typically integrate with and expand on existing municipal services.

The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement** chapter: **Program Coordination & Administration, Transit System Improvements,** and **Active Transportation Improvements.**

Communities with their own road, trail, and public transit infrastructure would tailor this service to their own infrastructure and services, which may also include regional transportation planning. In Bridgewater's case, intra and inter-community public transit services and active transportation infrastructure improvements are the primary areas of focus, though paratransit and ride sharing services may eventually form part of the service planning model as well.

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

Relationship to Data & Connected Technologies: mobility improvement planning efforts are enhanced by the use of data from the Housing Energy Management System and the Coordinated Access System through the use of spatial data and transportation network routing and planning, as well as mobility indicators and feedback from clients. These functions can effectively integrate into the municipal property and financial management platform.

This service funnels funds from investors into the services described above. Program investors are categorized into (1) social value investors, which include governments and charitable organizations, and (2) financial investors seeking a return on investments from housing and community energy systems. Using creative financing tools, property owners and households-at-risk can also become investors in the system and receive dividends.

The service consists of 2 sub-programs that are explained in detail in the **Performance Measurement** chapter, and expanded on in the **Financial chapter: Municipal Capitalization System, and Financial Investment Vehicle.**

This service builds on existing municipal competencies related to budgeting and asset

Page 939 of 1849

We can't judge people like 'How did you forget your child's mittens today?' when there may be water coming in their window, the landlord may not be available; they may be cold, they may be hungry.

– COMMUNITY SERVICE ORGAIZATION

management. Communities that work closely with external fundraising entities can leverage those relationships to build this system, and those municipalities that are permitted by legislation to use innovative capitalization strategies (e.g. community bonds or green bonds) may make use of those capitalization opportunities as well. In Bridgewater there is no existing Financial Investment Vehicle to leverage, so the implementation of this service includes a period of feasibility assessment and organizational development. Emerging energy financing services, including Energy Services Companies (ESCOs) are anticipated to play a significant role in the capitalization of these improvements both in Bridgewater and across the country.

Relationship to Data & Connected Technologies: financial planning efforts and investment opportunities are calculated and driven by the robust EMIS system that forms the core function of the program's data system. Financial planning and management for the

>>>

program can effectively integrate into the municipal property and financial management software described above. External financial investment systems will rely on external data platforms. In Bridgewater's case the external platform still needs to be determined, though for planning and budgeting purposes, the MaRS Centre for Social Innovation's SVX platform is used as the placeholder system for this service.

The relationship between these revised programs and those described in the initial application are summarized in Table 1.4.

The restructuring of the Energy Poverty Reduction Program has significantly improved its implementation potential, as well as improved transferability, scalability, and replicability to other communities.

Original and Revised Program Components

Program Components As Originally Proposed (April 2018)		Revised Program Components
Theme 1: housing and transportation investments	Program A: local clean energy investment system	Investment System
	Program B: comprehensive retrofit improvement program for low-income homes and rental properties	Housing Energy Management System
	Program C: regulations and incentives for the construction of new high-energy-performing affordable rental units	Housing Energy Management System
	Program D: public transit and active transportation service and infrastructure improvements	Mobility Improvement System
Theme 2: resident engagement and capacity building	Program E: engagement program for residents*	Coordinated Access System and Housing Energy Management System
	Program F: clean tech sector trades training program for residents	N/A
Theme 3: partner collaboration and capacity building	Program G: data sharing and collaboration program for partner organizations	Coordinated Access System

Table 1.4 *Program F, the clean tech sector trades training program for residents, was found to be impractical at this time, as local trades training organizations were unable to commit to trades training outcomes and timelines. Instead, the Nova Scotia Community College has provided a letter (see **Appendix**) indicating its ongoing support for the Energy Poverty Reduction Program, and its willingness to explore integration with its Work Integrated Learning courses, the Women Unlimited program, and participating in the Coordinated Access System in order to provide information, where applicable, around training opportunities. The College continues its interest in the creation of new programming options in the areas around Green Energy and Technologies, but this will require additional study and development before the College is able to confirm its offerings.

INNOVATIONS SUITABLE FOR NATIONAL DEMONSTRATION

This high-impact, comprehensive approach to community-based problem solving and transformational change is highly transferrable to communities across the country that are struggling with energy poverty challenges. As the world shifts its energy systems, these transitions will be inherently challenging as economic disruption occurs and less affluent Canadians are saddled with the remnants of outdated or legacy energy systems, whether those are housing technologies or energy systems from the last century. Municipalities are uniquely positioned to take advantage of emerging energy systems, pairing them with data and connected technologies, and delivering robust and accountable services that improve affordability and quality of life for historically underserved populations. In this way, municipalities can play a critical new role in facilitating a transformation for our communities, especially their most vulnerable members, through the coming energy shift.

By selecting Bridgewater as the winner in the $5 million Smart Cities Challenge prize category, Canada will support a powerful new demonstration of technology-enabled community-based problem solving to its stated objectives of addressing both the poverty crisis and the climate crisis at the same time.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

PERFORMANCE MEASUREMENT OVERVIEW

To support the ambitious scope and complexity of Bridgewater's Energy Poverty Reduction Program, we have developed a methodical implementation and performance measurement schedule. The following section outlines the activities and outputs, including deployment schedule and anticipated deliverables for each of the 5 systems that form the overall Energy Poverty Reduction Program: Coordinated Access; Housing Energy Management; Community Energy; Mobility Improvement; and, Investment.

An evaluation framework is proposed and detailed in Table 2.9. A logic model consisting of activities, outputs, and outcomes has been developed to guide the implementation process and allow for ongoing evaluation of program performance and quality. This logic model is illustrated in Diagram 2.1. Table 2.10 details the program outcome indicators, associated measurement methodologies and tracking systems.

Risks associated with the Energy Poverty Reduction Program are comprehensively described in the **Project Management chapter,** which also includes the risk management strategies and associated course correction checkpoints for the program.

PROPOSED PHASING AND PAYMENT SCHEDULE

As detailed in the **Project Management chapter,** progress toward our outcomes are being consistently monitored and measured. To implement the program and achieve the outcomes described above, we propose to receive Infrastructure Canada's grant contribution in 3 installments that are closely tied to the program budget. The contribution amount will cover core program costs (development, administration, and operations, minus any municipal in-kind contribution).

The Energy Poverty Reduction Program consists of a set of 5 interconnected systems that will be deployed in 4 phases; each building off each other with some overlap in the early phases. As a small community with limited resources and no ability to draw significantly from the tax base to implement the program's development, administrative, and operating costs, we propose that each contribution will be provided up-front for the next phase of work to avoid incurring project losses or debt. Therefore, the first contribution will be at the start of the project, while the second and third contributions will be tied to achieving program outputs for Phases 1 and 2, respectively. Table 2.1 describes the timing of phases, core program costs, contribution amounts and the number of households served. Households-at-risk are less likely to also be the property owner. So the number of households served will account for both the inhabitants and the property owners. Program phases:

- **Prototype Program Setup -** This phase includes partnership and governance development; detailed service and technical design; service procurement; client consultation; establishment of risk management and quality control systems and the evaluation framework; as well as a comprehensive Privacy Impact Assessment (PIA) on the detailed program design and an overarching privacy policy.

- **Prototype Program Testing & Refinement -** This phase involves a gradual ramping up of client intake; continuing design and implementation of services and technologies; and monitoring and evaluation of results. Program outcomes become measurable by the end of this phase.

- **Final Program Activation -** This phase requires the finalization of program service design and technical components; extensive documentation of program outcomes; and the development of learning materials for other communities and senior governments. The completion of the Final Program Activation phase marks the end of Smart Cities Challenge contribution agreement.

Coordinated Access System

PROGRAM ACTIVITIES AND OUTPUTS

COORDINATED ACCESS SYSTEM PROGRAM ACTIVITIES AND OUTPUTS

This program pulls together the partner organizations and service providers required to design and deliver a successful Coordinated Access System. It also maintains relationships and information sharing between the partners. As a service that will be contracted out to a qualified third-party organization, the Town of Bridgewater will work collaboratively with its community partners to develop the scope of the service, and to establish quality control parameters and performance metrics. In doing so, we will work closely with experts and expert organizations in this field, including provincial and national agencies with interests and expertise in coordinated access services.

- **Partnership development:** partner agencies will be brought together and will sign a memorandum of understanding for engaging in the Coordinated Access System.

Processed under the provisions of the Access to Information Act / Révisé en vertu de la Loi sur l'accès à l'information

Partners will be consulted through a series of workshops on the service model, process work flow, and governance structure. Existing community collaborations to leverage include the Lunenburg County Community Hub which already brings together a wide spectrum of government and non-profit service providers in a coordinated continuum of practice to support early intervention and health promotion efforts as well as to coordinate case care.

- **Program evaluation & improvement:** partners participate in ongoing program evaluation and improvement, with key service delivery partners actively participating in the evaluation process (see Overall Program Management later in this section). Evaluation will lead to periodic adjustments to the processes, policies and procedures of the service. Evaluation processes will be led and supported by staff and will involve client feedback on a regular basis.

Third party service providers will participate in an open procurement process for the provision of this service. Starting with a request for expressions of interest and culminating in a long-term service agreement, the Town of Bridgewater and its partners will assess service providers' expertise, capacity, and ability to deliver quality services that match the desired program scope. Service provision for this program may be paired with, and enhanced through, provision of Coordinated Access Services to a larger clientele than is envisioned through the Energy Poverty Reduction Program (e.g. for clients outside of Bridgewater). However, sufficient capacity and funding will need to be evident to ensure that program quality is maintained. Client services begin in 2021-22, and increase annually for each of the 3 remaining program years until the program reaches its mature state. The program partners will work closely with the service delivery organization to ensure that program quality is maintained; that information sharing and privacy obligations are met; and the program outcomes are being achieved.

- **Detailed program design:** building on the scope of work for the procured services, the service delivery partner will undertake the comprehensive design of the Coordinated Access Service. Specialized partners may be engaged in this stage, such as the Family Service of Western Nova Scotia or the Affordable Housing Association of Nova Scotia, both of which are currently active in developing coordinated access systems for their constituencies.
- **Staff hiring & training:** qualified staff, known in this program design terminology as the "Household Navigator(s)", will be hired and trained by the service delivery organization to support program design and to deliver the coordinated access service. Staff will be Clinical Social Workers who are licensed to practice in Nova Scotia. The service delivery partner will start by hiring 1.5 FTEs, which it will be able to expand to 2 FTEs by year 4. Staff will receive training in the specific clinical and administrative functions that will be required by the Energy Poverty Reduction Program, and they will be trained to use the program's data platform.
- **Database setup:** the Homeless Individuals and Families Information System (HIFIS) is readily customizable by service providers, and will be set up with the appropriate data entry forms and reporting forms required for the Coordinated Access System. As a free service with plenty of user support, this effort will be primarily carried out in-house by the Household Navigator(s), with an allowance for technical support and equipment (e.g. tablet computers for mobility).
- **Serve clients (2021 through 2030):** client service provision involves intake by the Household Navigator(s) from multiple referral points in the community, assessment and triage using a standardized intake tool (VI-SPDAT or similar), and referral to any and all community services the household may require. The Household Navigator maintains contact with

Processed under the provisions of the Access to Information Act /Révisé en vertu de la Loi sur l'accès à l'information

ATIA - 21(1)(b)

each client, providing the level of supportive service the household requires. The Navigator maintains client information in the HIFIS database, and only shares limited information, with the client's permission, with the rest of the Energy Poverty Reduction Program.

- **IT system maintenance:** there will be ongoing maintenance of the HIFIS system database, data entry and reporting forms, and maintenance of equipment.

- **Communications & marketing:** the program partners will design and implement a Communications Strategy for the Coordinated Access System which will include the following: (1) creating a clear understanding among all partners facilitating coordination of how the Coordinated Access System will function and how to engage residents on the system; (2) roll-out and maintenance of the Communications Strategy to inform underserved populations of the system; (3) ongoing communications with partners and funders to communicate the outcomes and evaluation of the service.

Housing Energy Management System

HOUSING ENERGY MANAGEMENT SYSTE

PROGRAM ACTIVITIES AND OUTPUTS

Extensive analysis of Bridgewater's housing stock started with the Community Energy Investment Plan from 2016 to 2018. The analysis resulted in the classification of the housing stock into 32 "archetypes" based on the type, size, and age of the homes. A fully-costed retrofit program was conceptually modelled for the entire residential sector, using ambitious energy targets: greater than 50% thermal and electrical energy efficiency gains, plus the widespread addition of on-site renewables and battery storage. New construction targets were set at Net Zero Ready (NZR) or Net Zero (NZ), which the Government of Canada has established as long-term targets for the national Building Code.
